Staged together with the *Dendrobiums* were *Cattleya Schroderae* delicata, a white variety; and a very peculiar form of *Odontoglossum x mulus*. A *Silver Flora Medal* was awarded.

NORMAN C. COOKSON, Esq., Oakwood, Wylam, Northumberland, showed several fine hybrid *Dendrobiums* raised in his garden. The best of which is, perhaps, *D. x Murray*

FIG. 57.—MOWER AND ROLLER DRIVEN BY ELECTRICITY. (SEE P. 400.)

FIG. 58.—MOWER AND ROLLER DRIVEN BY STEAM. (SEE P. 400.)

*Boissieri*, a form having curiously crimped foliage and bright flowers, and the rare *T. Eichleri* with much broader leaves and taller but exceedingly bright flowers (Award of Merit). Various *Cyclamens* and other plants were also shown (Bronze Banksian Medal).

meritorious strain of varied colours and shades (Silver Flora Medal)

Miscellaneous groups of decorative plants were staged by Messrs. Wm. CUTBUSH & SON, Highgate Nurseries, London, N., and Messrs. J. PEED & SONS, Roupell Park Nurseries, Norwood

(albo-sanguineum ♀, nobile ♂), a finely formed wax-like flower, white, with a dark purple disc on the lip. The present plant is the reverse cross to that originally flowered, and although somewhat better in form it is practically the same. The stout pseudo-bulb and broad leaves marked the infundibulum of *D. albo-sanguineum* (Award of Merit). Another pretty novelty was a bizarre, or striped, rose and white form of *D. dulce* (anreum × *Linawianum*) named *D. dulce picturatum*, also raised at Oakwood (Award of Merit); and *D. × Astrea* (uteolum × *crassinode*), *D. × Bryan* (uteolum × *Wardianum*), *D. × Lecchianum album*, and the pretty *D. nobile Arnoldianum*, whose lower sepals bear a broad purple band, were also shown by Mr. Cookson.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr., Mr. R. Aldous) received a Silver Flora Medal for a very pretty and effective group of Orchids, consisting of many subjects difficult of cultivation exceptionally well grown. The central attraction was a plant of *Odontoglossum × excellens* Rosslyn var., which was awarded a First-class Certificate, and which is, perhaps, in all points the best known *excellens*. It is likewise interesting as being the plant originally raised by J. Essrs. Jas. Veitch & Sons. The form of the flower is perfect, the white area at the base of the segments is effective, and the red-brown blotches clearly marked on the yellow-ground colour. Mr. Pitt received a Cultural Commendation for a very handsome *Odontoglossum Wilkeanum* with nineteen flowers; and also showed other fine *O. Wilkeanum* of which that named "rubiginosum" was the more distinct. There were also a singular and pretty series of varieties of *O. Andersonianum*; *O. Halli* with very peculiar fringed and striped labellum; a richly tinted *O. maculatum* with singular yellow ray on the lip; *Dendrobium nobile* Cookson, and other *Dendrobs*; five specimens of *Miltonia Roezlii* alba, *Angraecum sesquipedale*, *A. modestum*, *Epidendrum Wallisii*, &c.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, showed a very effective group of Orchids, comprising *Cymbidium × eburneo-Lowianum*; *Cattleya Schroderae caloglossa*, with very unusually bright lip, having a broad lavender-coloured margin (Award of Merit); *Odontoglossum Rossii asperum*, *Cypripedium × Schroderae candidum*, *Oncidium sarcodes*, *Dendrobium × Virginii* (Bensoniae × *Maniforme*), *D. × Aeneas* (crystallinum × *moniforme*), *Phalaenopsis Aphrodite*, *P. Sanderiana*, *Cattleya Trianae albescens*, and many very finely coloured forms; splendid specimens of *Dendrobium Devonianum*, *D. atropurpureum*, and other *Dendrobs*; *Bifrenaria Harrisonii*, *Platyclinis glumacea*, *Epidendrum × O'Brienianum* in various shades of rose and red; and some very handsome *Cypripediums* (Silver Flora Medal).

Mr. WM. BULL, King's Road, Chelsea, contributed one of the largest and most effective groups, in which all the showy Orchids of the season were represented. Among them were some interesting *Odontoglossums* which showed the wide range of variations included under *O. lanceans*, Reich. f.; of these *O. Jenningsianum parvicutatum*, *O. odontoglossum*, *O. baphicentum*, and several obscure forms of *O. Andersonianum*, were chiefly remarkable.

A fine lot of *Miltonia Roezlii*, and plants of *Masdevallia caudata* Shuttleworthii, M. Schlunii, *Cypripedium Exul*, *Aerides Houletianum*, *Odontoglossum Edwardii*, *Oncidium sarcodes*, (*Dendrobium Wardianum*, *Oncidium crispum* were included (Silver Flora Medal).

Messrs. HUGH LOW & CO., Clapton, were also awarded a Silver Flora Medal for a good group, comprising the yellow *Cypripedium insignis* Lutwycheum, *Phalaenopsis × leucorhoda*, *P. × intermedia* Portei, some fine forms of *Cattleya Trianae*; a very stout bulb and large form of *Dendrobium crassinode*, and a very stout and large form of the ordinary variety; varieties of the *Miltonia Roezlii*, *Dendrobium Hildebrandii*, *Cypripediums*, &c.

Messrs. P. SANDER & CO., St. Albans, staged a very pretty group, in the centre of which was a many-flowered specimen of the pink-tinted *Angulosa uniflora* Turneri, which flowered out of their importation provisionally named *alba-magna*; and the very remarkable *Odontoglossum × Wilkeanum* Cookson, with very large pale yellow flowers, the greater part of the sepals being coloured rich brown, the petals also being less profusely marked with the same colour; and the lip, which had a very conspicuous crest, bearing one large brown blotch (Award of Merit). *Odontoglossum luteo-purpureum* scepterum regale, with a very pretty circular crimson lip. *Cologyne DAYANA*, *Zygopetalum crinitum*, *Dendrobium aggregatum*, *Trichopilia stuevei*, *Cymbidium Lowianum aureum*, *Dendrobium Dearei*, &c. (Silver Banksian Medal).

Messrs. CHARLESWORTH & CO., Herton, Bradford, received a Silver Banksian Medal for a select group of Orchids, in which were many good *Odontoglossums*—*O. crispum*, *O. Andersonianum*, *O. cirrosum*, *O. Rossii in tunc*, *O. ramosissimum*, *O. Lindenii*, *O. Halli*, *Maxillaria Sanderiana*, *Sophronites grandiflora*, *Cologyne speciosa* mrtot, &c.

Baron Sir H. SCHRODER, The Dell, Egham (gr., Mr. H. Ballantine), showed *Odontoglossum crispum* Evelina, a grand white form uniformly spotted with purplish chocolate. It is one of the most distinct of spotted *crispums*, and altogether a charming thing (Award of Merit).

Sir THOMAS LAWRENCE, BARR, Burford, Dorset (gr., Mr. W. H. White), showed *Cattleya Trianae* "Reine des Belges," a noble flower with glowing purplish ruby-red fringed lip, handsome and very distinct (Award of Merit).

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed *Odontoglossum × Coradinei*, Rosefield variety, a showy flower and one of the very best of its class; flowers of the yellow of brass with large chestnut red blotches (Award of Merit).

J. HAWTHORN KITSON, Esq., Elmet Hall, Leeds (gr., Mr. Thos. Bonsall), showed *Odontoglossum Andersonianum* Kitsoni (*Gardeners' Chronicle*, March 21), a very distinct form with uniformly broad segments. The plant opened three weeks ago with twelve flowers, but most of them had been cut, and the rest evidently past their best.

R. I. MEASTRES, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), again showed *Cypripedium × Woottonii* (callosum × *bellatulum*) a fine flower, larger than *C. × Chas. Richman* and lighter in colour; and *C. × Olenus*.

H. GRINLING, Esq., Harrow Weald House, Stammore (gr., Mr. Rapley), showed a very handsomely spotted form of *Odontoglossum nebulosum*.

H. MASON, Esq., Bankfield, Shipley, Yorks, showed *Odontoglossum Humeanum* excellens, a very richly coloured and handsome form of the natural hybrid *O. Rossii majus × cordatum*. The sepals were dark brown with a few thin, wavy yellow bars, the yellow petals having some brown spots at the base, and the white lip a clear yellow cellus (Award of Merit); and *O. Ruckerianum* Masonii, good in form, in colour cream-white, tinged and spotted with purple (Award of Merit).

THOS. STATTER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson) sent *Cypripedium hirsutissimum*, Stand Hall var., very good in colour, and as the species had not before been distinguished it received an Award of Merit.

WELBORE S. ELLIS, Esq., Hazelbourne, Dorking (gr., Mr. Masterton) showed a splendid plant of *Odontoglossum crispum* with sixty-five flowers on a stout inflorescence with eleven branches (Cultural Commendation); and a profusely-flowered plant of *Maxillaria lepidota* (Botanical Certificate).

GEO. HODGSON, Esq., Hemsworth, Wakefield, sent a light form of *Cattleya Trianae*.

PANTIA RALLI, Esq., Ashted Park, Surrey, showed *Phaius Mannii*.

J. T. GABRIEL, Esq., Roupell Park, Streatham Hill (gr., Mr. E. Ranson), showed *Dendrobium Wardianum grandiflorum*.

Mr. CHALMERS, Tertegles Gardens, Dumfries, sent *Dendrobium × nobile × Wardianum*, which, though small seemed to be *D. × Murrhinianum*, which is the same cross.

Mr. H. A. TRACY, Anyand Park Road, Twickenham, showed *EPH* species, *Phalaenopsis Stuartiana* and *Dendrobium Devonianum*.

Messrs. GARRAWAY & CO., Durdham Down, Bristol, showed a striking plant in growth resembling *Aerides crispum* Warnerii, but with white flowers, also scented like the species named. The flowers showed traces of malformation.

C. L. N. INGRAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), showed *Cattleya × Lawrenceana × Mendeli*, a very pretty hybrid identical with the *C. × Wm. Murray* raised and shown by Norman C. Cookson, Esq.

### Narcissus Committee.

Present: Mr. J. T. Bennett-Poë, Chairman; Rev. S. E. Bourne, Rev. G. H. Engleheart, Miss Willmott, Messrs. Walker, Kingsmill, Barr, De Graaf, Cowan, Serace-Dickins, and others.

The striking difference of weather between the past winter and that of 1894-95 is evidenced by the contrast between the two springs as regards the blooming of the Narcissus. Last year all the varieties woke up simultaneously after the long frost. Early, mid-season, and late kinds all appearing in flower at once. But since Christmas there has been a steady unchecked growth, which has separated these by their normal and well-defined intervals. Consequently only the trade growers, who have facilities for accelerating the tardier sorts in quantity under glass, could produce the familiar banks and tiers of 100 kinds or more. Indeed, the only exhibit of noteworthy dimensions was that of Messrs. BARR & SON, who had a very large and varied display. Very good and well-grown was the pale Ajax Mrs. Thompson, and pairs of *Corbularia citrina*.

The only prize offered for a collection of named sorts, in six varieties, grown without protection, was won by J. T. BENNETT-POË, Esq., Holmewood, Cheshunt. The prize for the best new seedling was taken by Rev. G. H. ENGLEHEART, with his seedling No. 478, a fine Ajax with white segments and deep cream-tinted crown. He also showed a set, in pots, of hybrids of *N. triandrus* and the best forms of Ajax, some of which are of extreme beauty, notably Snowdrop, from *N. albicans × triandrus*, a large, clear white drooping flower, almost like a *Fuchsia* in shape and pose. This was repeated in miniature by the outcome of the little *Pyrenean moschatus × triandrus*. Very robust and attractive are the forms resulting from Emperor, Horsfieldi, poeticus, &c., by pollen of triandrus. These hybrids form a very distinct and lovely section of Narcissus.

Mr. J. C. CORNHILL, of Byfleet, sent a very sturdy and symmetrical double yellow Daffodil, raised from the common double yellow of gardens and the Tenby variety.

A large flower from Mr. Jas. Hounslow, gr. to the MARCHMANS of HEADFORD, did not differ from the commercial Daffodil princeps in anything but size, and was thought somewhat coarse.

### Fruit and Vegetable Committee.

Present: Dr. R. Hogg in the Chair; and Messrs. T. F. Rivers, Geo. Bunyard, Jos. Cheal, A. F. Barron, G. W. Cummins, P. C. M. Veitch, Wm. Pope, T. J. Saltmarsh, J. Wright, Alex. Dean, C. Herrin, John A. Laing, Geo. Wythes, G. H. Sage, H. Balderson, F. Smith, F. Q. Lano, G. Norman and Robt. Fife.

Messrs. T. RIVERS & SON, Sawbridgeworth, showed a few fruits of Wagener Apples in excellent condition.

Mr. W. BELL, Ramsden, Essex, sent a small highly-coloured Apple named Sunset, described as an enormous bearer, and in season from Lady-day until Midsummer, but of very poor flavour.

Messrs. JARMAN & CO., Chard, Somerset, had a few fruits of an Apple named Whiteways Wimple Wonder, but they were thought to be identical with Grainger's Pearmain. The conical and angular Apple, Scotch Bridget, was shown by Mr. W. TROUGHTON, The Nurseries, Walton-le-Dale, Preston.

Mr. Geo. Wythes, gr. to Earl Percy, Syon House, Brentford, exhibited an excellent collection of Salads in twenty-four varieties, which served well to illustrate the lecture upon this subject. Radishes, Beet, Cucumbers, Celeriac, Onions, Endive, Celery, Lettuce, Mustard and Cress, Garlic and Chives, were amongst the most noticeable of this collection. Excellent purple Seakale was shown from the open ground, and Asparagus also. A dozen small but young and most pretty heads of Veitch's Main Crop Broccoli were the subjects of much admiration (Silver Banksian Medal).

### Lecture by Mr. Iggulden.

IN the afternoon a paper by Mr. W. Iggulden on "Summer Saladings" was read by the Assistant-Secretary. Prefacing his remarks by saying that Britishers failed to appreciate salads to the extent the French did, and that they were less successful in the raising and preparation of the ingredients, the lecturer passed to the consideration of some of the principal kinds. These were Lettices, Onions, Mustard, Cress, Cucumbers, and Tomatos. Each was the subject of a few remarks, and directions as to the continuous supply of them during the summer and autumn were given. Before concluding, Mr. Iggulden referred to the value of Beetroot also, and gave a few hints upon the preparation of the plants into salading. The discussion was chiefly remarkable for a vigorous denunciation by Mr. A. Dean of the practice of adding such (disgusting) additions as mentioned by Mr. Iggulden, to tasteful, healthful vegetables. Evidently, Mr. Dean would prefer his salad without the "pure salad oil," and possibly without the raw eggs, and some other of the foreign ingredients also.

"By all means," said Mr. Dean, "encourage an appreciation and taste for salads," but at the same time he would assure his listeners that everything that was required to make them toothsome, enjoyable and healthful was already placed in them by nature. A few other speakers, including the chairman (Mr. Geo. Gordon), continued the discussion.

### EDINBURGH BOTANICAL.

MARCH 12.—The usual monthly meeting of the Edinburgh Botanical Society, was held on the above date, Dr. A. P. Aitken, President, in the chair. After the Report of the proceedings of the Council had been read, Mr. Symington Grievie exhibited branches of the Spruce Fir with galls upon them. The formation of these galls was explained by Mr. R. Stewart Macdonald, B.Sc., who gave the life history of the insect which caused them.

The exhibits from the Royal Botanic Garden included *Odontoglossum dicranophorum*, *Leelia glauca*, *Vanda parviflora*, *Oncidium pubes*, *Dendrobium moniliforme*, *D. Cassiope Colax jugosum*, and others. Mr. Macdonald showed a series of excellent lantern slides illustrating the two great forest devastations, one on the Spruce by the Nun Moth caterpillars; and the other by the caterpillars of the Pine-Lupar Moth on the Scots Fir. In Bavaria last year and the year before, over 40,000 acres of Scots Fir were attacked. As a remedy millions of trees half way through their rotation have had to be felled, over 5000 workmen being engaged in the work in the Nuremberg State Forest.

Comparisons were also made as showing the different results to the health and the life of the tree of an early attack and a late one. The outcome of an attack on a forest by early feeding caterpillars like those of the Nun Moth, whose eating ended in July, was shown to be much more disastrous than in the case of attack by the Pine-Lupar caterpillars, which started feeding in July, and ended in October. This was apart altogether from the fact that the Spruce is much more sensitive to defoliation than the Scots Fir. The Spruce too easily falls a victim to sunstroke, whereas sunstroke in the case of Scots Fir seems practically unknown.

Mr. R. Lindsay in reporting upon the Vegetation in the Royal Botanic Garden, gave a list of plants producing flowers during February, illustrating the exceptionally mild weather experienced. From the meteorological report taken in the garden by Mr. A. D. Richardson, are the following items: *Barometre*. Highest 30.583 at 9 a.m. on the 3rd. Lowest 29.439 inches on the 19th. The mean 30.111, being 0.290 inch above average for five preceding years. *Protectral Thermometers*. Highest 53.8° on the 11th. Lowest 28.9° on the 19th. Mean for month 42.4°, this being 4.8° degrees above average for February for five years. Frost occurred on six days.

*Indication Thermometers*. Highest in sun 97° on the 28th. Lowest on grass 17.7° on the 18th.

*Sunshine*. Total recorded 42 hours 20 minutes, being 16% of possible amount. No sun was recorded on 10 days.

*Rainfall*. Rain fell on 12 days. Total fall 0.810 inch, being 1.57 inch below the average for February for five preceding years. Greatest fall in 24 hours 0.265 inch on the 8th.

**DEVON AND EXETER GARDENERS' ASSOCIATION.**

**Spring Flower Show.**

MARCH 18.—The third, and by far the best annual exhibition this society has held, took place in the Royal Public Rooms, Exeter, on the above date. The entries numbered 128 as against 67 last year, and the attendance was much larger. The schedule proved to be popular, for there was not a single class for which an entry was not forthcoming, while in many of the classes the competition was close and spirited. The President's prize was given for the best decorated table with spring flowers (no plants or fruit to be used) laid as for dessert for six persons. There were three entries, and the competition was close. The prize was awarded to Miss KINGDON, Taddyford, Exeter. Daffodils were used in this arrangement, and sprays of Berberis and other bronzy foliage. The centre of the table was draped with yellow silk, laid, with studied negligence, at the foot of a handsome epergne centre-piece. Hyacinths were fairly well shown. A prize was given by the chairman of Jadou Ltd. (Col. HALFORD THOMPSON), for six Hyacinths grown in Jadou fibre, and in this class Messrs. ROBERT VEITCH & SON were placed first for six well grown Hyacinths, the trusses being large and well finished, the colours particularly pure and bright, and the foliage very healthy and strong. Tulips were a strong class, and some first-rate flowers were shown. Freesias were uneven, but the 1st prize collection was good. Spiraeas were, comparatively, a failure. The class for Tree Carnations only produced one entry, but three fine plants were shown. Daffodils were well contested, and some very fine flowers were staged. In the trumpet classes, Emperor, Empress, Maximus, Golden Spur, Princeps, and cernuus were all good. In the incomparable section, Sir Watkin had it all his own way. The Poeticus section was but feebly represented. In the Polyanthus Narcissus class, Grand Monarque and Grand Soleil d'Or were conspicuously fine. The Primulas and Cyclamens shown by Mr. A. Williams, gr. to Mrs. A. D. SIM, Knowle, were very good. Lilies of the Valley were very fine. Cinerarias fair. Azaleas in pots produced three specimens of the type so dear to old-fashioned gardeners, but while symmetry in form was attained, perfection in flowering was not, there being an abundance of flowers on one side, while the other was thin and unequal. White Arum were very good. In the cut flower classes, the Daffodil bouquets, while not wanting in merit, left much to be desired. The basket of Daffodils was better. The hall bouquet prize was won with an indifferent exhibit, the flowers were good and plentiful, but the arrangement crude and inartistic. Flowering plants and table plants were very uneven, some really fine specimens being staged alongside others much below exhibition standard. The Violets shown by Mr. ABRAM, gr. to T. KEKEWICH, Esq., Peamore, were excellent in every way.

**HONORARY EXHIBITS.**

Messrs. ROBERT VEITCH & SON filled one end of the hall with a display of conservatory plants, Narcissi and Hyacinths. Their Hyacinths were well-grown, and showed a fine diversity and brilliancy of colour. Among their Narcissi were fine bunches of N. cernuus, cernuus flore pleno, Sir Watkin, Katherine Spurrell, Queen Bess, maximum, and other leading sorts. Rhododendron Fosterianum, Lotus peliorhynchus, Colens "Beauty of Exeter," and Richardia Magdalene, and some of the new blue Primroses, were conspicuous on their stand. Mr. W. J. GODFREY, Exmouth, had a fine collection of Pelargoniums. Messrs. RUSH & CO. showed some really artistic specimens of bouquetists' work. The exhibition was greatly helped by large contributions of flowering and foliage plants from the conservatories of Mrs. THORNTON WEST, Streatham Hall; T. KEKEWICH, Esq., Peamore; Mrs. A. D. SIM, Knowle; and Mrs. MILES, Dix's Field House. The Exeter Vegetarian Society had a side show of their specialties. The Silver Challenge Cup given by Mrs. THORNTON WEST, to be held for the year by the member gaining the largest number of points during the exhibition, was won by Mr. GEO. CRABBE of Prospect Park.

**VARIORUM.**

**MR. RICHARD NICHOLAS**, who was gardener to Earl Fortescue, at Castle Hill, South Molton, for twenty years, of which fourteen were passed as Head, has left his post owing to reduction in the establishment, and he has taken East Johnston Farm, at South Molton.

**PLANT NAMES IN POLYNESIA.**—At a full meeting of the Victoria Institute, held on Monday, March 2, Sir George Stokes, Bart., F.R.S., in the chair, Dr. H. B. Guppy gave an interesting account of his researches as to the light thrown by a study of the differences in plant names in use among the Polynesians. He said the more useful plants of these islands, and many also of their littoral plants, have in each case a story to tell, not only of the history of a plant, but of a people. The distribution, the uses, the vernacular nomenclature, &c., are all so many guides in such an investigation.

The wide range of the useful plants in this region, such as the Banana, the Breadfruit, and the Paper-Mulberry, is an indication of an age of free intercourse over the Pacific, an age long since passed away. Under the conditions prevailing in this region in the time of Cook, a newly-introduced plant would acquire a very local distribution and among such plants we may include the Shaddock of Figi and Tonga. Almost all the plants, and in most cases their names, have their homes in the Indian Archipelago and in further India. On comparing the names of the different regions, the Malagasy names are found to be more closely

FIG. 59.—FRITILLARIA PUDICA. (SEE P. 400, COL. C.)

connected with those of Fiji than with those of Polynesia. The Melanesian variety of man is regarded as the original possessor of the Malayo-Polynesian type of speech, which it has imposed to a greater or less degree on all that have come in contact with it. Many took part in the discussion that followed. *The Daily Chronicle.*

**ENQUIRY.**

**ACCUBA BERRIES.**—Will some one familiar with the Japanese flora kindly tell us at what season the berries are produced in Japan? Here it seems odd to see the berries ripening now just at, or a very little before, the time when the male flowers expand. What an addition the male plant has proved to our out-door gardens! It was to Fortune and the Royal Horticultural Society that we owe that and so many other boons, and yet the Royal Horticultural Society has forgotten to place portraits of Fortune, Hartweg, or Douglas in the library. X.

**MARKETS.**

**COVENT GARDEN, MARCH 26.**

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

**OLD POTATOS.**

Trade is still very dull, and the prospects for a bad finish seem to become daily worse.

**NEW POTATOS.**

Arrivals are gradually increasing. Best samples are selling freely, at 15s. to 22s.; ordinary, from 12s. to 14s. Small parcels from Malta, 12s. to 18s.

Reports from Jersey (Outdoor Crop):—"Mild weather is favouring rapid growth, and some of the earlier spots will be fit to earth-up this week." J. B. Thomas.

**POTATOS.**

**BOROUGH March 24.**—Quotations ranged from 30s. to 90s. per ton.

**SPITALFIELDS, March 24.**—Quotations:—Black lands: Bruces, 25s. to 35s.; Reading Giants, 30s. to 40s.; High lands: Bruces, 40s. to 50s.; Main Crops, 45s. to 55s.; Giants, 45s. to 60s.; Sutton's Abundance, 40s. to 50s.; Druids, 45s. to 55s.; Saxons, 70s. to 90s.; Scotch Bruces, 45s. to 55s.; do., Main Crop, 50s. to 60s.; Dunbars, 80s. to 90s. per ton.

**STRATFORD, March 21.**—Quotations:—Dark soil Bruce, 25s. to 30s.; light do., 30s. to 50s.; Reading Giants, 30s. to 50s.; Sutton's Abundance, 30s. to 60s.; Scotch Main Crop, 70s. to 80s.; Maganms, 80s. to 85s. per ton.

**FARRINGTON: March 26.**—Quotations:—Saxons, 70s. to 80s.; Dunbar Main Crop, 60s. to 80s.; Bruces, 60s. to 70s.; Hebrons, 80s. to 90s.; Main Crop, 40s. to 50s.; Sutton's Abundance, 45s. to 55s.; Imperators, 30s. to 35s.; Magnams, 30s. to 35s. per ton.

**SEEDS.**

**LONDON: March 25.**—Messrs. Joan Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended, with a small business doing. Sowing operations are much retarded by the wet condition of the soil. Mstantime prices all round show no important variation, and fine samples of Clover, Grass seeds, &c., can be secured for very little money. For Tares the demand is mesgre. Sainfoin is scarce, and dearer. The birdseed trade is lifeless. Linseed continues very dull. There is no alteration in either Peas or Haricots. Rape seed keeps firm, but Mustard is neglected.

**FRUIT AND VEGETABLES.**

**BOROUGH: March 24.**—Quotations:—Savoys, 3s. 6d. to 4s. per tally; Turnip-tops 1s. to 1s. 6d. per bag; Carrots, 2s. 6d. to 2s. 9d.; and Turnips, 2s. to 2s. 9d. per dozen bunches; Horse-radish, 8s. to 10s. per dozen rolls; Apples, 4s. to 6s. per bushel.

**SPITALFIELDS, March 24.**—Quotations:—Greens, bunch, 1s. 6d. to 2s. 6d. per dozen bunches; Broccoli, 6d. to 1s. per bushel; 9d. to 1s. per bag; Spring Onions, 1s. 6d. to 2s. per dozen bunches; Rhubarb, 2s. 6d.; Leeks, 1s. 3d. to 1s. 6d. per dozen; Parsley, 1s. to 1s. 6d. per dozen bunches; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 1s. 9d. to 2s. 6d.; Kale, 9d. to 1s. per bag; Spinach, 1s. 3d. to 1s. 6d. per half-sieve; Turnip-tops, 9d. to 1s. per bag; Turnips, 2s. to 3s. per ton; Carrots (household), 2s. 6d. to 2s. 9d.; horse do., 17s. 6d. to 20s. 6d.; Horse-radish, 1s. to 1s. 3d. per bundle; Parsnips, 5d. to 6d. per score; Apples, dessert, 5s. 6d. to 6s. 6d. per bushel; do., cooking, 5s. to 6s. 6d.

**STRATFORD: March 25.**—Quotations:—Greens, 1s. 3d. to 1s. 6d. per dozen; Cauliflowers, 1s. 6d. to 1s. 9d. per dozen; do., 5s. 6d. to 7s. 6d. per crate; Scotch Kale, 6d. to 9d. per sieve; Sprouting Broccoli, 1s. to 1s. 6d. per bag; Turnip-tops, 1s. to 1s. 6d. per bag; Beetroot, 4d. to 6d. per dozen; Horse-radish, 1s. to 1s. 3d. per bundle; Parsley, 1s. per dozen; Rhubarb, forced 1s. per dozen; do., field, 2s. 6d. to 3s. per dozen; white Turnips, 1s. 9d. to 2s. per bag; Leeks, 1s. 6d. to 2s. per dozen; Spring Onions, 1s. 6d. to 2s. per dozen; Salad, 1s. 6d. per dozen punnets; Carrots, household, 2s. to 2s. 6d. per ton; do., cattle-feeding, 2s. to 2s. 6d.; Parsnips, 4d. to 6d. per score; Mangolds, 12s. to 16s. per ton; Swedes, 12s. to 18s. per ton; Onions, English 6s. to 8s. per ton; do., Dutch, 2s. 6d. to 2s. 9d. per bag; do., Bordeaux port, 4s. to 5s. 6d. per case; Apples, English cookers, 4s. to 5s. 6d. per bushel; do., English dessert, 4s. to 5s. per barrel; do., Nova Scotian, 14s. to 16s. per barrel.

**FARRINGTON: March 26.**—Quotations:—Savoys, 7s. per tally; bunch Greens, 7s. 3d. to 9d. per bushel; Cauliflowers, 1s. to 1s. 6d. per dozen; Leeks, 1s. do.; Kale, 6d. per bushel; Seakale, 10s. to 12s. per dozen; Parsley, 1s. 6d. per dozen bunches; Carrots, 2s. per dozen; Turnips, 2s. per dozen bunches; Cucumbers, 4s. per dozen; Rhubarb, 2s. per dozen bundles; Horse-radish, 1s. per bundle; Apples, 17s. to 18s. per barrel; for Nonpariels, Beo Davis, 20s. to 22s. do.

**HAY.**

**Averages.**—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 65s. to 87s. 6d.; inferior, 38s. to 60s.; hay, best, 80s. to 85s.; inferior, 30s. to 55s.; mixture, 60s. to 81s.; and straw, 20s. to 40s. per load.

**CORN.**

**Averages.**—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending March 21, and for the corresponding period last year:—1896: Wheat, 25s. 1d.; Barley, 31s. 1d.; Oats, 13s. 9d. 18 5: Wheat, 20s.; Barley, 21s. 10d.; Oats, 13s. 10d.

**"THE AUTO-CAR."**—The issue of the twentieth number of this journal is witness, not merely to the merit of the publication, but to the fact that mechanically propelled road carriages have many advocates interested in the literature of the subject. There is abundant proof that horseless conveyances of some, or of many a kind will be largely used in the future, when the restrictions with regard to them have been removed. The subject is by no means a new one, but progression has been slow; lately, however, an increased activity has been manifested, and this will undoubtedly have due results in hastening the time when auto-cars, motor-cars, motorcycle, and automobilic machines, at present somewhat mysterious to ordinary mortals, shall be familiar objects in our streets and roads. For florists, to aid

them in the conveyance of their fragile wares, and for exhibition purposes, auto-cars would be found valuable as the flowers would be less exposed to the risks pertaining to railroad carriage. The journal devoted to the consideration of these vehicles is recommended to readers who seek information concerning them. The editor is Mr. H. Sturmeay, and the publishers' address, 19, Hereford Street, Coventry.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E;
- 4, Midland Counties; 5, England, including London, S.
- Principal Grazing, &c. Districts—6, Scotland, W;
- 7, England, N.W.; 8, England, S.W. 9, Ireland, N.;
- 10, Ireland, S. \* Channel Islands.

**THE PAST WEEK.**

The following summary record of the weather throughout the British Islands for the week ending March 21, is furnished from the Meteorological Office:—

"The weather during this period was very changeable. Rain fell frequently, and the amounts were sometimes rather large. Many intervals of bright sunshine were experienced, however, especially in the north and west. Thunder and lightning occurred at some of the north-western stations on Friday.

"The temperature was above the mean in all districts, the excess ranging from 1° in 'Ireland,' to 2° in most other districts, and to 3° in 'England, S and S.W.,' and the 'Channel Islands.' The highest of the maxima were recorded towards the end of the week, and ranged from 56° in the 'Mid and Counties,' to 52° in 'Scotland, W.' The lowest of the minima were registered, as a rule, on the 19th, when they ranged from 26° in 'England, S.W.,' to 31° in 'England, N.E.,' and to 40° in the 'Channel Islands.'

"The rainfall exceeded the mean in all parts of the kingdom, the excess being large in nearly all districts. In the south and east of England, the fall during the week was about three times as large as the normal value.

"The bright sunshine exceeded the mean in Ireland, Scotland, and the north-west of England, but showed a deficit elsewhere. The percentage of the possible duration ranged from 43 in 'Ireland, N.,' and 41 in 'Scotland, E.,' to 22 in the Channel Islands, 21 in 'England, E.,' and 20 in 'England, S.'"

**SISAL HEMP.**—Dr. MORRIS lectured on the Sisal industry at the Society of Arts on the 18th inst. Dr. MORRIS, as we have already indicated, turned a winter vacation to advantage by visiting the Bahamas, where the Sisal, *Agave rigida*, var. *sisalana* is now largely cultivated for its fine white fibre. Dr. MORRIS's paper gives a summary history of the cultivation of the plant in various West Indian islands, Yucatan, British Honduras, &c.

**A HOUSE WITH A GARDEN:** *Greenhorn.* Without having seen the garden we cannot advise you; but as you say you know nothing whatever about gardening, you ought to call in an expert—say, the local nurseryman—to lay out and plant the garden.

**BULBS DISEASED:** *P. & Sons.* Your Tulips and Hyacinths are suffering from the "Lily disease," described by Professor Marshall Ward (*Annals of Botany*), and which is caused by a fungus of the genus *Polyactis*. We can suggest no remedy, since it attacks the growing point, and destroys the young "blooms," as well as the foliage. All the diseased plants would be better removed and destroyed, to prevent the disease spreading. Wet weather is favourable to the fungus, and so is a stiff retentive soil. *M. C. C.*

**CHRYSANTHEMUM PLANTS GNAWED BY GRUBS:** *J. H.* The insects sent had escaped from the box; and only gnawed plants were found, which showed the work of some weevils or weevil grubs. What the fly was that you saw on the leaf we are unable to say. It is yet too early for the leaf-miner fly to be about. To destroy winged pests on the plants you should fumigate once a fortnight. Weevils and their grubs are more difficult to deal with. Soil should be used which is not infested with the grubs; and if in doubt have it well searched before using it. The perfect insects can be caught at night by suddenly turning on a dark lantern on entering the house, and gathering up the beetles as they drop from the plants, which they do immediately the light is turned on. The plants should be stood at wide distances apart on sheets of white paper, &c.

**CINERARIAS:** *H. H. D.* We see nothing unusual in the flowers; the white appearance of some of the florets before they open is not uncommon.

**DENDROBIUM NOBILE:** *J. A.* It is not uncommon for *Dendrobium nobile* to send out young growths and flowers from the pseudo-bulbs, but it is not considered desirable that it should do so.

**GARDENING INFORMATION:** *C. E.* Kindly send specimen paragraph.

**HORTICULTURAL BUILDINGS:** *G. T. J.* If within an urban area you must consult the town or district surveyor.

**INSECTS:** *W. G.* Those you send are wireworms, than which there are few pests more injurious. If they are present in pots or in any soil in which plants are now growing, it is almost impossible to rid it of them. You might try clear lime or soot-water, or turn each plant out and examine them carefully, and remove all that can be found, and repot, if possible, into soil clear from the pest. On the other hand, if they occur in loam not yet in use, it will be well to break it up finely by hand, and remove as many of them as can be found. If the soil be baked before using it is sure to kill most or all of them. It may be worth while to consider whether it is more convenient to adopt such precautions or to obtain fresh soil in which the pest is not present in any quantity.

**LABURNUM WITH YELLOW AND PURPLE-COLOURED FLOWERS:** *W. C.* It is the result of budding *Cytisus purpureus* on *Laburnum vulgare*. The curious result of this proceeding, in some cases, is to have flowers in some parts of the tree resembling one or the other of the parents. The purple one is known in gardens as *Cytisus Adami*.

**LANDSCAPE GARDENING:** *J. K. S.* You should let the young man enter the employment of some firm of nurserymen largely engaged in landscape work. Here he would gain a practical acquaintance with the work, which he should supplement by taking lessons in field-surveying, levelling, measurements

of quantities, &c. The books which would be found of value meantime, are Kemp's *How to Lay out a Garden* (Bradbury, Agnew, & Co., Bouverie Street, London, E.C.), Milber's *Landscape Gardening* (Simpkin, Marshall, Hamilton, Keut & Co., Limited, Stationers' Hall Court, London, E.C.), *Landscape Gardening*, by Parsons (G. P. Putnam's Sons, 27, King William Street, London, E.C.). Other books to be read are *Corder's Landscape Gardening in Japan*; *Parks and Gardens of Paris* (Robinson); *The Tree Lifter*, by Greenwood.

**LILY:** *A. E. S.* We cannot tell from the specimen sent, but we think it very likely. We have no experience of the use of the Bordeaux Mixture in this case, but we should certainly try it cautiously on a few plants first and watch the results.

**MOWERS:** *G. S. C.* We know of no mower cutting grass by means of revolving spiral knives and a cutter plate that will make good work of long rye or other grass at one cutting, although by altering the height of the cutters above the sward it could be done at two operations, of course, lowering them on going over the turf on the second occasion. For makers we must refer you to our advertisement columns. Really long grass would need the scythe or the machine used in cutting hay-grass.

**MUSHROOMS:** *J. L.* What you send is the "sclerote," or resting stage of the fungus.

**NAMES OF FRUIT:** *J. H.* Hoary Morning.—*G. W. C.* The Apple you send is certainly not Northern Spy, which is always very highly coloured; we do not recognize it.

**NAMES OF PLANTS:** *M. A. Rolfe, Stamford-le-Hope.* *Freesia refracta alba*, see illustration, p. 392.—*R. M. 1*, *Daphne Mezereum*; *2*, *Pyrus japonica*; *3*, *Jasminum nudiflorum*; *4*, *Anemone appennina*; *5*, *Erythronium dens canis*; *6*, *Orobanchium*.—*J. P.* *Forsythia suspensa*.—*D. I.* *Picea sitchensis*; *2*, *Abies nobilis*; *3*, *Abies nobilis*; *4 & 5*, *Pseudotsuga Douglasi*; *6*, *Juniperus excelsa* Perkinsi.—*A. J. A. B.* *Forsythia suspensa*.—*W. C. R.* *Sherardia arvensis* with whorls of small leaves. Send the other when in flower.—*Belfast 1*, *Begonia riciniifolia*; *2*, *Begonia manicata*.—*Pteris*. The specimen sent seems very distinct. It is new to us.

**PHLOX:** *W. C.* The imported plants, of which you send roots, are badly attacked with eel-worm. Better destroy the plant—or, at least, isolate it. Wash the roots, and put them in fresh soil.

**PRIMULA SINENSIS:** *J. L. & Sons.* Very good, but nothing of extraordinary merit.

**PROLIFEROUS ROSE:** *W. F., Jamaica.* Does it not show the axial nature of the "hip." In your case it is prolonged into a flower-bearing shoot, a common occurrence here. Perhaps in your moist hot climate the change may be even more frequent.

**RHODODENDRON:** *A. M. W.* The surest way to increase any particular hardy variety is by inarching on the *R. pouticum*. The stocks should have been in pots for at least a period of seven or eight months, and the operation should be done in early summer in the greenhouse or out of doors.

**RUST ON MELON PLANTS:** *T. B.* It is a matter of treatment, the young plants have been incautiously ventilated in cold weather, or ammonia fumes from fermenting stable-dung have come into contact with them. The roots are healthy, and the soil is what it should be.

**COMMUNICATIONS RECEIVED.**—*J. McIntyre.*—*J. Leman.*—*J. W.*—*A. Barnes.*—*Dr. Muller.*—*G. P.*—*W. W.*—*H. H.*—*D. M.*—*R. B.*—*J. W. B.*—*John Baker* and *W. H. R.* (next week)—*R. B.*—*T. Sohren.*—*A. R.*—*E. H. M.*—*D. M.*—*T. F.*—*O. D.*—*E. C. Y.*—*M.*—*Experience.*—*F. R.*—*F. R.*—*D.*—*W. J. B.*—*W. B. H.*—*G. W.*—*J. W.*—*C. L.*

**SPECIMENS, PHOTOGRAPHS, ETC., RECEIVED WITH THANKS**—

**CONTINUED INCREASE** in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

**IMPORTANT TO ADVERTISERS.**—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

increased to the extent of more than 90 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries

### NOTICE TO ADVERTISERS.

FRIDAY NEXT, April 3, being GOOD FRIDAY, the "GARDENERS' CHRONICLE" will be published on THURSDAY, April 2.

ADVERTISEMENTS for NEXT WEEK must therefore reach the Office not LATER than WEDNESDAY MORNING, April 1.

**BEESON'S MANURE, SHEFFIELD.**—For Vines, Plants, and Vegetables. Sold with a Guaranteed Analysis. Has stood the test of the principal growers for over 23 years, and is admitted to be the Best for all Horticultural Purposes. In boxes, 1<sup>st</sup> and 2<sup>nd</sup> 6d.; bags, 50 lb., 8s.; 1 cwt., 15s. May be obtained through any seedsman; or, direct (bags only), carriage paid, and liberal discount for cash with trial order, from W. H. BEESON, SHEFFIELD. Pure Crushed Bones, all sizes, and other Fertilisers at market prices.

**NATIVE GUANO.**—BEST AND CHEAPEST MANURE FOR GARDEN USE. Price £3 10s. per ton, in bags. Lots under 10 cwt., 4s. per cwt.; 1 cwt. sample bag sent carriage paid to any station in England, on receipt of P. O. for 5s. Extracts from 20th Annual Collection of Reports:—

**NATIVE GUANO FOR POTATOS, VEGETABLES, &c.**  
**B. LEE & SON, Market Gardeners, Burnham:**—Used for three years for Vegetables, Strawberries, Cucumbers, Tomatos, and other Market Garden Crops, and it has "given great satisfaction for all crops." **T. REASON, Gardener to Lord Windsor:**—Used for several years for Potatos and general Kitchen Garden Crops. Results: "Good. A capital manure."

**NATIVE GUANO FOR FRUIT, ROSES, TOMATOS, &c.**  
**G. STONARD, Gardener to Sir A. T. Watson, Reigate:**—"I have used your Guano for five years, and can bear testimony to its great value for fruit growing." **C. ROUSE, Nazing Park Garden, Waltham Cross:**—Used for Tomatos, Cucumbers, Chrysanthemums, and Roses. Results: "A marked improvement wherever used. A good and cheap manure."

Orders to the Native Guano Co., Ltd., 29, New Bridge Street, Blackfriars, London, where pamphlets of testimonials, &c., may be obtained. AGENTS WANTED.

### XL ALL LIQUID INSECTICIDE, (PATENT),

For Syringing, Dipping, and Washing Plants and Fruit Trees.

Manufactured in Bond, from pure Nicotine of Tobacco, by special permission of the Hon. Board of H.M. Customs.

**ADVANTAGES CLAIMED**—It is always of uniform strength, and perfectly safe when used as directed. Kills every insect which affects Plants and Fruit Trees. Does not stain Foliage, Flowers, or Fruit. A clear Liquid (no sediment), heretofore differing from the crude, thick, soapy preparations frequently recommended. Being the Strongest in the Market, it is cheap in use, standing twice the amount of dilution of any other safe preparation. As an example, Kills Fly at 1 to 40 parts of water.

1 Pint, 2s.; 1 Quart, 3s. 6d.; 1-Gallon, 5s.; 1 Gallon, 10s.; also in 4 and 6-Gallon Drums.

To be had from all Nurserymen, Seedsmen, and Sundriesmen; or direct from the Manufacturer and Patentee—

**G. H. RICHARDS,**  
Old Shot Tower Wharf, Lambeth, London, S.E.  
Telegraphic Address—"Vaporizing, London."

### KILL-M-RIGHT

Certain cure for Blight, and all Insect Pests, without injury to plants. Once tried, always used. Sample Tin, 2 lb., free by Post, on receipt of P.O. for 2s 10d. Price LIST and testimonials on application.

The STOTT FERTILISER & INSECTICIDE CO.,  
BARTON HOUSE, MANCHESTER.

**GISHURST COMPOUND**, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

**GISHURSTINE** keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s. with the Trade. Wholesale from **PRIOE'S PATENT CANDLE COMPANY** (Limited), London.

## STANDEN'S MANURE.

ESTABLISHED OVER 30 YEARS.

Exceeds all others in General Fertilising Properties and Staying Powers.

It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell. The highly fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

# MACMILLAN & CO.'S PUBLICATIONS.

## GREENHOUSE and WINDOW PLANTS.

A Primer for Amateurs. By CHARLES COLLINS. Edited by J. WRIGHT, F.R.H.S. With 38 Illustrations. Pott Svo. 1s.

*Nature News.*—"This little book of 154 pages is crammed with useful information for would-be growers of greenhouse and window plants. We hope Mr. Collins' little book will secure as large an amount of patronage as it certainly deserves."

## THE BOOK OF THE ROSE.

By the Rev. A. FOSTER-MELLIAR, M.A., Rector of Sproughton, Suffolk. Illustrated. Extra crown Svo, 8s. 6d. net.

*Gardeners' Chronicle.*—"As the work of a sound and experienced practitioner, this will be received with acclamation."

*Journal of Horticulture.*—"A work of permanent value to be treasured and studied for the information that it contains."

## VEGETABLE CULTURE. A Primer for Amateurs, Cottagers, and Allotment Holders.

By ALEXANDER DEAN, F.R.H.S. Edited by J. WRIGHT. With 38 Illustrations. Pott Svo. 1s.

*Journal of Horticulture.*—"Vegetable Culture' is as thorough, concise, and instructive as either of the preceding Primers, and more than that need not be said."

## GARDEN FLOWERS and PLANTS. A

Primer for Amateurs. By J. WRIGHT, F.R.H.S. With 50 Illustrations. Pott Svo. 1s.

*Saturday Review.*—"There is no doubt that practically this little text-book will prove invaluable; the beginner will find in it exactly the information he must know, and generally does not, for the lack of a little telling. The cuts, too, are models of what such illustrations should be; they give the necessary information where words would be unconvincing."

## A PRIMER OF PRACTICAL HORTICULTURE.

Ten Lectures delivered for the Surrey County Council. By J. WRIGHT, F.R.H.S. Pott Svo. 1s.

*Rural World.*—"Clearly written by a man who knows what he is talking about."

MACMILLAN & CO., Ltd., LONDON.

# CLAY'S

# MANURES

Price 5s.; post free, 5s. 6d.

A. F. BARRON, 13, Sutton Court Road, Chiswick.

AND FOR ALL GLASS STRUCTURES THAT REQUIRE SHADING.

It combines efficiency with appearance, convenience with economy, and its effects are lasting, while it is easily removed when necessary with hot water. It can be supplied either pale green or grey.

The public are warned against spurious imitations which are offered them, through the success obtained for many years by Elliott's "Summer Cloud" Shading, and they should see that in ordering they get the "Summer Cloud," which is the only original and bona fide article, with the Trade Mark on each packet.

Sold in pkts., 1s. each, and in bags, 7 lb., 10s. 6d.; 14 lb. 20s.

To be had of the SEED and NURSERY TRADE generally. Manufacturers: CORRY AND CO., Ltd., London.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s.  
If set across three Columns the lowest charge will be 30s.  
Page, 28; Half Page, 24 10s.; Column, 23.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale. Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

### SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

## WANT PLACES.

### TO GARDENERS AND OTHERS SEEKING SITUATIONS.

The pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

#### Gardeners, Farm-Balliffs, Foresters, &c.

**DICKSONS, Royal Nurseries, Chertea**, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHERESTER."

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

**CANNELL'S STAR OF HONOUR, OPEN TO KENT, SURREY, and SUSSEX.**—The winner of the above distinction immediately retires, and is for ever known as a first-class producer of Fruit, Flowers, and Vegetables. The competition takes place at the Great Show, Sevenoaks, on August 12 next, and we believe for the first time in history, the second and third men are awarded prizes, thus stimulating the whole establishment into higher exertions to win, and also to make gentlemen's gardens more productive, interesting, and attractive. SWANLEY, KENT.

### The Sensation of the Century.

**CROZY'S NEW FRENCH GLADIOLUS-FLOWERED DWARF CANNAS** produce gorgeous masses of brilliant colour, either in the flower garden or conservatory. Strong dry roots of best kind, Free by Post, 9s., 12s., and 15s. per dozen.—B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, London, N.

**100 ACRES OF DAHLIAS.**—The Dahlias we send out in one season are sufficient to plant 100 acres. Our price for all sections, our selection, is 5s. per dozen. In every dozen Double Cactus varieties we shall include either "Lady Penzance" or "Matchless," and deal as liberally with selections from other classes. DAHLIA CUTTINGS.—We are still supplying the best varieties of all sections, our selection, at 1s. 10d. per dozen, 3s. 4d. for 25, 5s. 10d. for 50, 10s. 6d. per 100, post free. DOBBIE AND CO., Florists to the Queen, Rothesay.

## SUTTON'S SEEDS.

**SUTTON'S BEAUTIFUL LAWNS: HOW TO MAKE AND KEEP THEM.**—See SUTTON'S Pamphlet on Lawns. Price 1s.; gratis to customers.

**SUTTON'S SEEDS for MAKING and IMPROVING LAWNS.**—Sow 3 to 4 bushels per acre for making a new Lawn, or 1 bushel per acre to improve existing turf.

**SUTTON'S FINE GRASSES ONLY for TENNIS LAWNS.**—A prescription of strictly perennial Grasses without Clovers, specially adapted to produce a close, fine, enduring sward. Price 3s. 6d. per gallon; 25s. per bushel.

**SUTTON'S GRASSES and CLOVERS for GARDEN LAWNS.**—A combination of fine Grasses and Clovers, proved by long experience to be suitable for the creation of an elastic velvety turf. Price 3s. 6d. per gallon; 25s. per bushel.

**SUTTON'S AI LAWN MANURE.**—Invaluable for renewing and keeping Lawns a beautiful bright green colour. Tins 1s., 2s. 6d., and 4s. 6d. Kegs of 28 lb., 10s. 6d.

**SUTTON'S LAWN MOWER.**—A good Machine is essential in maintaining the turf in high condition. We can with confidence recommend The SUTTON LAWN MOWER as the best in existence. In various sizes from 8 inches to 22 inches (width of cutter). Price from £2 15s. to £9 10s.

**SUTTON'S SEEDS GENUINE ONLY DIRECT FROM SUTTON AND SONS, THE ROYAL SEEDSMEN, READING.**

**KENT, THE GARDEN OF ENGLAND.**—GEORGE BUNYARD & Co., The Royal Nurseries, Maidstone, are the largest growers and the best cultivators of fruit trees. CATALOGUE, six stamps, 800 kinds, true to name.

Demy quarto, printed on fine paper, ingrain, gilt top. Price, £1 11s. 6d.

**THE ART and PRACTICE of LANDSCAPE GARDENING.** By H. E. MILNER, A.M.L.C.E., F.L.S. With Etched Illustrations and Hand-coloured Plates. To be obtained from the Author, 7, Victoria Street, S.W.; or, from the Publishers, SIMPKIN MARSHALL & CO., Ltd.

**GLOXINIA "AIGBURTH CRIMSON."**—Matchless vivid crimson self variety, of great size, finest form and substance; reproduced quite true from seeds—the most brilliant variety ever raised. First-class Certificate. Per packet, 2s. 6d. from leading seedsmen, or post-free from the raisers.—BOBT. P. KER AND SONS, Banquet St., Liverpool.

**DICKSONS SPECIAL LAWN MANURE.**—Composed of the best and most suitable materials for sustaining the finer Grasses. A moderate application will rapidly produce a rich growth of a beautiful dark-green colour. Priced circular on application. DICKSONS, Royal Seed Warehouse, CHESTER.

**H. AND F. SHARPE** are now offering their selected Stocks of all the best varieties of SEED POTATOS, at greatly REDUCED PRICES, to clear out. Special quotations on application. SEED GROWING ESTABLISHMENT, WISBECH.

**To the Trade and Private Gardeners. WANTED, BOX EDGING.**—Either overgrown to plant for stock, or for immediate use. Correspondence invited. WM. CLIBBAN AND SON, Nurserymen, Altrincham.

**WANTED, SIX Large HELIOTROPES,** 4 to 5 feet, to plant against a wall. State particulars to B. S. WILLIAMS AND SON, Victoria and Paradise Nurseries, Upper Holloway, N.

Imported Orchids, including—

ODONTOGLOSSUM MADRENSE, in fine pieces. First importation for some years.

ODONTOGLOSSUM LONDESBOROUGHIANUM. Splendid plants of this exceedingly rare Orchid, which every Orchid lover should grow.

LELIA PEONULARIS, very scarce. A few grand plants.

ODONTOGLOSSUM DOMINIANUM, Var. A great improvement on O. maculatum.

CATTLEYA WARNERII. Special collection from a private estate. Small well-leaved plants.

BARKERIA ELEGANS (?), from a new district. One of the grandest Orchids.

LELIA TENEBROSA. A few plants.

CATTLEYA CITRINA MAGNIFICA. Fine masses.

EPIDENDRUM VITELLINUM MAJUS, CATTLEYA HARRISONIE VIOLEACEA, &c.

MR. J. C. STEVENS will sell the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, April 9, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Wednesday, April 8.

12,000 Double and Single BEGONIAS, 10,000 GLADIOLUS BRENCHELYENSIS, 2500 LILIAM TIGRINUM FLORE-PLENO, 500 L. TIGRINUM SPLENDENS, 400 half-standard and dwarf ROSES, 300 AZALEA MOLLIS, 100 A. INDICA, 50 RHODODENDRONS, and 50 ROSES in pots from the Continent; 50 choice named AURICULAS, 50 lots of Ornamental STOVE and GREENHOUSE PALMS, &c., 400 lots of CARNATIONS, HOLLYHOOKS, IRIS, hardy PERENNIALS, and other HERBACEOUS PLANTS, American PEARL TUBEROSES, SPITHEAS, SHOW, POMPON, and CACTUS DAHLIAS, CALCEOLARIAS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, April 8, at Twelve o'clock.

On view morning of Sale, and Catalogues had.

Friday, April 17.

25 CASES of CATTLEYA TRIANÆI, Popayan Variety.

COLLECTED BY CONSUL F. C. LEHMANN, In fine condition.

The grandest and richest in colour, and the widest in variation of any form of C. labiata.

In his letter of advice, which is in our hands, Mr Lehmann says:—"The plants have been collected in the same locality from which the few finest specimens emanated from that I sent to Europe in 1882. These plants cannot be too highly recommended, both with respect to colour and to size of flower. I have visited every locality of the entire region in which *Cattleya Trianæi* grows, and I can truthfully declare that there is none in which the plants are so thoroughly good. But for some four to six years no good specimens can be sent again, for every good one in this particular spot has been collected."

Also (in Case No. 5) plants of a

CATTLEYA VARIETY,

with red leaves and bulbs. The flowers of this are of a very tender rose colour with deep-coloured lip. This can very easily be distinguished botanically by the texture of leaves, bulbs, and flowers. Some of the finest are described and numbered, and among them are several white varieties. The plants are uniformly good and leafy, some of them having over 100 bulbs. And a few lots of a very handsome strain of

ODONTOGLOSSUM LUTO-PURPUREUM.

varying from almost wholly bright yellow to yellow and dark purple-brown, no two being alike, and *Eriopsis rutidubulbon*, the handsomest of the genus, together with

250 DISA GRANDIFLORA SUPERBA,

sound fresh gathered tubers just starting into growth (another property).

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, April 17, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

Friday Next, April 10.

GREAT SALE OF ORCHIDS.

Splendid Consignments, Plants in superb order, of CATTLEYA SANDERIANA, variety *The Trimegietus*, or *Thrice Greatest*.—Flowers up to 10 inches across, and nine on a spike! and maroon, purple, old gold, crimson, and rosy blush.

CATTLEYA AUREA, found growing with *Cattleya Sanderiana* var. Collector says they are the Monte Coronel form. The finest form known; and as they were found intermixed with the above magnificent variety of C. Sanderiana, superb new kinds and hybrids will be among the plants now offered.

300 SEEDLING PLANTS, mostly unfowered plants, very distinct-looking; probably natural hybrids between *Sanderiana* x *auræa* and *auræa* x *Sanderiana* *Trimegietus* var. We fully expect that even the magnificent varieties flowered from our previous importations will be surpassed. No plants have ever before been imported from which such splendid varieties may be expected.

Also,

DENDROBIUM NOBILE, from the Lang Tang Mountains, the district which has yielded all the finest forms, such as *Balliana*, *Sanderæ*, *Sanderisæa* *Amesie*, *Rolfiæ*, *albiflora*, *grandiflora*, &c.

CYMRIDIUM SPECIES, bearing a strong resemblance to the Superb C. *Traceyanum*. The old flower-spikes are gigantic.

DENDROBIUM TERMINALE, probably offered for the first time.

DENDROBIUM FINDLAYANUM ALBUM.

DENDROBIUM FINDLAYANUM GIGANTEUM, the large-flowered, richly-coloured form.

CYPRIPEDIUM INSIGNIS MONTANUM.—A fine consignment from the Sanderæ district. Many superb varieties are among them.

DENDROBIUM CRASSINODE.—A splendid consignment. The plants are perfect, and such varieties as *Barberianum*, *album*, &c., are certain to be yielded.

DENDROBIUM WARDIANUM GIGANTUM.—The huge brilliant-coloured Upper Burmese forms the finest of all.

DENDROBIUM INFUNDIBULUM, a grand lot of plants. The huge golden yellow and pure white blossoms are invaluable to Florists, and for all kinds of decoration.

DENDROBIUM DENSIFLORUM, CYPRIPEDIUM EXUL, &c., &c.

TO BE SOLD BY AUCTION BY

MESSRS. PROTHEROE AND MORRIS at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, April 10, at half-past 12 o'clock, On view morning of Sale, and Catalogues had.

Friday, April 10.

EXHIBITION HOLLYHOOKS, PYRETHRUMS, RANUNCULUS, CHRYSANTHEMUMS, PEONIES, HERBACEOUS PHLOXES, GLADIOLI, LILIUMS in variety, 300 STANDARD and DWARF ROSES, IRIS, CYPRIPEDIUM SPECTABILE, TRITOMAS, CARNATIONS and PICOTEEES, VALLOTIAS, AMARYLLIS, DAHLIAS, HARDY CLIMBERS, BEGONIAS, PANCRATIUMS, TIGRIDIAS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, April 10, at 12 o'clock.

On view morning of Sale, and Catalogues had.

Ickworth Park, Bury St. Edmunds.

CLEARANCE SALE OF STOVE, GREENHOUSE, and BEDDING PLANTS, GARDEN IMPLEMENTS, &c., by order of A. H. Wood, Esq., whose Lease of the Estate has expired.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION, on the Premises, Ickworth Park, Bury St. Edmunds, about 4 miles from Bury St. Edmunds Railway Station, on THURSDAY, April 23, at half-past 12 o'clock, the whole of the well-grown STOVE and GREENHOUSE PLANTS, also about 100 Orchids, 5000 Geraniums, 400 Fruiting Strawberries, about 100 lots of Garden Implements, 3 Mowing Machines, Lights, Frames, Tanks, Garden Engines, and numerous other items.

May be viewed day prior to the Sale. Catalogues may be had of Mr. H. COSTER, Head Gardener, on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

Friday Next, April 10.

SPECIAL IMPORTATIONS. RECEIVED DIRECT,

For UNRESERVED SALE,

And to be sold in Cases as received.

5 cases of CATTLEYA TRIANÆI—POPAYAN Variety.

6 " CATTLEYA LABIATA.

32 " ODONTOGLOSSUM ALEXANDRÆ.

1 case ODONTOGLOSSUM ALEXANDRÆ, specially

marked pieces, to be sold in suitable lots.

MESSRS. PROTHEROE AND MORRIS will

include the above in their ORCHID SALE on FRIDAY

NEXT, April 10, at Half-past Twelve o'clock.

On view morning of Sale, and Catalogues had.

WANTED, AT ONCE, TO RENT, small quantity of GLASS, with no Stock. Rent moderate.—Write to ROSES, 41, Wellington Street, Strand, W.C.

KENT, near three important Towns.—Valuable FREEHOLD NURSERY, 23 acres; 29 modern Greenhouses and Vineries, efficiently heated; 5 ditto, not heated; commodious Dwelling-house, Cottages, Stabling, and Out-buildings, all in excellent order. Price £3000, or offer. Full particulars of PROTHEROE & MORRIS, 67 & 68, Cheapside, London, E.C. (Folio 5627.)

FOR SALE, a small valuable long leasehold NURSERY, 6 miles from Covent Garden. Seven large Greenhouses, well stocked; two Vineries, Cucumber-house, Plant-houses, five-roomed Cottage. Low Ground Rent. Lease eighty-six years to expire. Eighty-five feet glass. Facing main road. All particulars of FLORIST, 11, Dalborne Road, Tooting, Surrey.

To Nurserymen and Florists commencing Business.

**DICKSON'S NURSERIES, CHESTER.**

**GARDEN FLOWERS and PLANTS.** A Primer for Amateurs. By J. WRIGHT, F.R.H.S. With 50 Illustrations. Pott 8vo. 1s.

*Saturday Review*.—"There is no doubt that practically this little text-book will prove invaluable; the beginner will find in it exactly the information he must know, and generally does not, for the lack of a little telling. The cuts, too, are models of what such illustrations should be; they give the necessary information where words would be unconvincing."

**A PRIMER OF PRACTICAL HORTICULTURE.** Ten Lectures delivered for the Surrey County Council. By J. WRIGHT, F.R.H.S. Pott 8vo. 1s.

*Rural World*.—"Clearly written by a man who knows what he is talking about."

Pony, and Doukey Use.

HAND MACHINES, driven by Chain  
or Gear, and Fitted with Springs.

**TESTIMONIAL.**

LORD'S CRICKET GROUND, LONDON,  
June 15, 1894.

I have used your Lawn Mowers for over twenty years,  
and have no fault to find with them. I consider them the  
best in the market, and they are the only Machines we use  
here. The addition of the springs to our 48-in. Mower  
is a great improvement, and the machine works with great  
ease and smoothness. I consider you have made a good  
hit.—Yours truly, (Signed) PERCY PEARCE,  
Ground Superintendent.

Paris International Exhibition, Highest Award, Silver Medal.  
NO AWARD WAS GIVEN to any English or Continental-made Lawn Mowers.

**THE "PENNSYLVANIA"**

IS THE

Perfection of EASY WORKING and EFFICIENCY.

The ONLY AMERICAN LAWN MOWER fitted with Six Cutting Blades.

**THE "PENNSYLVANIA"**

IS THE

**MACHINE**

FOR  
**GOLF LINKS.**

Above illustration shows the machine as it appears when OUT OF GEAR, and in the proper position for running it easily from one place to another, over gravel walks or rough and uneven ground. When moving it in this way there is no unnecessary wear of the driving pinions, all risk of damaging the cutting knives is avoided, and the machine can be pushed over the ground with very little labour—a great advantage in extensive gardens, but especially on GOLF LINKS.

Gardeners who have once tried the "Pennsylvania" Lawn Mower, will use no other.

**THE "PENNSYLVANIA."**

CARRIAGE PAID TO ALL STATIONS.

**THE "PENNSYLVANIA."**

ONE MONTH'S FREE TRIAL ALLOWED.

TESTIMONIAL—

"World's Columbian Exposition, Chicago, October 16, 1893.  
"Gentlemen,—I desire to state that we have used the 'Pennsylvania' Lawn Mowers almost exclusively during the progress of the Fair, with the most satisfactory results. The ease in working them was remarkable, and they did more work than we supposed was possible for Lawn Mowers to accomplish. The appearance and condition of our lawns, in comparison with others, prove the high grade and superiority of these Lawn Mowers.—A. B. FARQUHAR, Executive Commissioner."

THE

**Gardeners' Chronicle.**

SATURDAY, APRIL 4, 1896.

ROLLESTON, STAFFORDSHIRE.

ALTHOUGH the physical characteristics of the country around Rolleston are less romantic-looking than some which are distinctive of other parts of the same county, the valley in which the parish is situated, on the south bank of the river Dove, is pleasant and fertile. Near the river (which here forms the boundary-line between Staffordshire and Derbyshire), there are fine woods, and the timber trees are of large size. Rolleston lies 3½ miles north-north-west from Burton-on-Trent, and is doubtless a very ancient village. It is said that by a charter dated in 1008, "Ethelred gave it in exchange for the villages of Edeswithe and Elfredinton to Abbot Walget. In the time of Edward the Confessor, it was the lordship of Earl Teste, at whose death the king gave it to Morcar, Earl of Northumberland. William the Conqueror gave it to Henry de Ferrers, but it was forfeited to the Crown in 1269, by Robert of the same house, and last Earl of Derby of that name, who was taken prisoner in 1266, at the battle of Chesterfield. Many particulars of an interesting nature, relating to the ancient history of the place, are given in Harwood's *Erdeswick*, from which it appears that the village and park belonged for a number of years to a family of the name of Rolleston, which name it is supposed was assumed by the family when it acquired the revenues of the Ferrers. There is a MS. in the British Museum of the reign of Queen Elizabeth, which gives a full descriptive account of "Rolleston Parke," when it was the property of the Crown. In this MS. occur the following passages:—"It is within the manor of Rolleston, and within the ward of Tutbury, within half a mile of the castle." The face of the park, which is now about 300 acres, is thus portrayed: "Whereof in Marsh overgrown with allers six acres, in meadows three acres, and the rest is all very good and beautiful pasture. It will bear well deer, and sufficient herbage to make the King's rent, which is yearly cvis. viiij."

After giving particulars of the number of deer on the place, it is stated that there is "no covert, but the marsh and allers, and the rest is well planted with old Oaks and some timber." Speaking of Rolleston, we are told, "it is well inhabited by divers honest men whose trade of living is only by husbandry." There are many more inhabitants now than at that time, and we hope they are equally honest.

Rolleston Hall is now the seat of Sir Oswald Mosley, Bart., whose family first obtained possession of the place in 1614. Sir O. Mosley is also Lord of the Manor, and principal landowner. The present handsome mansion (fig. 61, p. 421),

which stands on the site of a very ancient building (it is thought that there has been a residence here since the days of Henry III.), was erected nearly 170 years ago, but in 1871 a portion of the house was destroyed by fire. Since that date it has been very thoroughly restored, wings have been added, and a fine conservatory also, which may be seen in the figure. There appears to have been an intelligent interest manifested in the gardens ever since the Mosley family acquired the place. The following is a letter respecting the place in 1841 which appeared in the first volume of the *Gardeners' Chronicle* :—

"There is a most luxuriant plant of *Ipomoea Learii* in the Orchidaceous-house, which has produced daily from thirty to forty blossoms for the last fortnight. *Calandrina discolor* and *grandiflora*, with *Portulaca Thellusonii*, are in flower in the frames. The Limes have suffered generally from a caterpillar of one of the Tortrices. Several of the choice Firs have many leading shoots of 6 or 7 inches, but the most astonishing growth is apparent in the circumference of many of the forest trees. Amongst others, a Sycamore near the north-west angle of the house, which in 1840 measured (at 3 feet from the ground), 5 feet 8 inches in girth, now measures 6 feet 3½ in.; a *Quercus cerris* near the rockery, which did not at the former period exceed 3 feet 3 inches, is now increased to 3 feet 10½ inches; and a common Oak (*pedunculata*), which was then 5 feet 4 inches in circumference, rather exceeds at the present time 5 feet 9 inches. These comparative dimensions appear extraordinary, considering that they have been taken within a year and a quarter of each other. The Cedar of Lebanon is by no means a slow-growing tree; one of these which Sir O. Mosley planted in 1805, rather exceeds 4 feet 6 inches in girth at 3 feet from the ground, and is at least 35 feet high."

The years that have since passed, however, have proved that Conifers generally do not thrive at Rolleston, the ground being too cold and stiff.

The amount of flower gardening outside is not unusually extensive. It is contained principally on the two terraces near the Hall. On what is known as the upper terrace there are ten beds, eight of which are filled in the summer with carpet designs, and the remaining two with tuberous Begonias or other effective flowering plants. Then there are twelve additional beds of large size on the lower terrace, which are furnished with Calceolarias, Pelargoniums, Heliotrope, Verbenas, and such like plants. In the centre is an ornamental fountain.

The lawn slopes gently from the house on the south, across the park to a very fine lake, and there is a very pretty and excellent waterfall. The park is well timbered with Oaks, Elms, and Chestnuts. On the eastern side the lawn extends down to the very ancient parish church, of which the picturesque tower and spire can be easily seen. The church was thoroughly restored and enlarged in 1892. In this part of the lawn are some very fine American Oaks, including the Champion Oak, *Quercus americana rubra*, *Pavia rubra*, and *P. discolor*, also *Acer dasycarpum*, *Fraxinus Ornus*, Limes, Purple Beech, Elus, Yews, and Hollies. Some old ruins which have been brought from a neighbouring village, have been placed in a natural manner in the pleasure-grounds. There are numbers of shrubberies, and the borders in front of these are sown each year with annuals, such as French and African Marigolds, Linums, Godetias, Tropæolums, Shirley Poppies, Mignonette, Collinsia, &c.

The museum is a distinct and novel feature of the grounds. After an inspection of the gardens, an hour can be very pleasantly spent among the treasures contained there. These consist principally of English birds, the collection of which is very complete, and small native carnivora. Everything has been beautifully mounted, and is in a good state of preservation. Such a natural history museum is not by any means out of place in a large and well-maintained garden. In front of this museum an out-of-door rosary was made a year or more ago, and a few flower-beds on the fine turf.

There is an extensive kitchen garden, but it is not all contained together and enclosed with walls. There are, however, plenty of good fruit walls, and trees thereon which the present gardener may be trusted to make the most of. It is satisfactory to record that this garden contains an unusually good collection of salads, and most kinds of vegetables are well cultivated. The gardener takes an especial interest

in the cultivation of Blackberries, as well as Raspberries. He succeeds with the former capitally, and the fruit is much appreciated in the mansion. The varieties include *Rubus laciniatus* and the American variety, Wilson Junior. The first-named variety grows 8 to 10 feet, and the latter from 5 to 6 feet high. They are both very vigorous, and at Rolleston bear large crops of fine fruit annually. [The cultivation given them here was described in *Gardeners' Chronicle*, Jan. 11, p. 46.] Raspberries are likewise very satisfactory in this garden, where the cool stiff soil so well meets their requirements; and there is an excellent new plantation of the variety Superlative. There are numbers of bush fruit trees, some very old, but we have seen good crops of fruit upon these, especially on those of Lord Suffield. The fruit-garden contains over 100 Apple trees of the best sorts, trained as espaliers; also pyramidal Plums and Pears in variety, which have been planted about four years, the intermediate ground being filled with Strawberries of the leading kinds.

#### GLASS HOUSES.

The extent of glass is considerable. First, there is the private conservatory already alluded to, which is

FIG. 60.—A PRUNELLUS SCOTS FIR. (SEE P. 421.)

furnished with Palms, Bamboos, &c., and brightened by the addition of flowering plants. On the walls are Bignonias, Hibbertias, Passifloras, and Plumbago; *Cobea scandens* trails gracefully below the roof, and there are Fuchsias attached to the pillars. There is also a capital span-roofed stove, and a comparatively new house for the cultivation of Cattleyas. The latter is nearly 25 feet wide. In this house we noticed a stock of imported species, and miscellaneous established Orchids, including several fine plants of *Phalaenopsis*. There are three useful houses about 20 feet wide (span), in which greenhouse plants are principally grown. Of the vineries, one was planted with new canes last spring, and another contains comparatively young ones, whilst a third is to be overhauled owing to bad drainage. A capital Peach-house is also included here, which measures about 80 feet long and 30 feet wide. Vines are cultivated along the top of this. A lean-to house, which had formerly been employed for the cultivation of Figs, we found had been re-arranged. The Figs are now grown on the back wall, and Tomatoes at the front. If Figs are not appreciated, it may be useless to grow them well, but we cannot understand why such a delicious fruit should be unwelcome.

The gardens have during the last year or so been under the management of Mr. Geo. Woodgate, who is

supplying our Hardy Fruit Garden Calendar during the present year. Mr. Woodgate is well known in the south as the late Secretary of the Kingston Chrysanthemum Society, and to his genial character and energetic work that society is, in large measure, indebted for the position it has attained. When Mr. Woodgate has had more time to develop the gardens at Rolleston, a work in which he is now engaged, and in which he has every encouragement from Sir O. Mosley, we feel sure they will be of considerable importance.

One satisfactory feature of Rolleston has yet to be related. During the months of May, June, and July in each year, the public is permitted free access to the gardens and grounds on each Wednesday and Saturday. Last season, this privilege was enjoyed by nearly 4000 persons.

## TREES AND SHRUBS.

### PRUNUS MUME.

A DISTINCT and valuable addition to early-flowering hardy trees is this beautiful Apricot from Japan, recently introduced. It is a dwarf tree, flowering before the leaves, and with the common Almond, so that full effect is given to its bright flowers, which recall those of *Prunus triloba* in size and colour. In the Japanese nurseries there are several varieties sold under the names of white single, white double, pink single, pink double, red double, red very double, and red with drooping branches. These forms have no doubt all resulted from cultivation, and the selection of seedlings, as it has for ages been a favourite spring flower with the Japanese, for one sees it in every garden, generally as pot plants—dwarf bushes often contorted in the usual Chino-Japanese fashion. We welcome it in English gardens, though it blooms with the Almond and Peach, and especially if we can get all the forms of it the Japanese have. It looks very much like an Almond, but Professor Sargent says it is really an Apricot. He also says it is not a true Japanese tree, but a native of Corea. It is no doubt thoroughly hardy, and may be seen in the Arboretum at Kew in flower. *W. G.*

### RHODODENDRON MUCRONULATUM.

This deciduous-leaved shrub, raised in the Arnold Arboretum from seed gathered on the mountains near Pekin, and sent in 1883 by Dr. Bretschneider, at that time surgeon of the Russian Embassy in the Chinese capital, is closely related to the Siberian and Manchurian *Rhododendron dauricum*, although, for garden purposes at least, it will, perhaps, be well to consider it distinct. In American gardens it is now a robust shrub from 3 to 4 feet in height, with slender stems, and branches clothed during their first year with smooth, rather light yellow bark. The leaves, which do not unfold until after the flowers have begun to fade, are oblong, gradually narrowed to both ends, and mucronate at the apex, very finely serrate, thin and firm, dark green above, pale and pubescent below, from 2 to 2½ inches long, about 1 inch wide and short-stalked, turning in the autumn, before falling, bright scarlet. The flowers are broadly campanulate, about 1 inch across, and light clear rose coloured, with broad rounded corolla lobes, and are produced in two to four-flowered clusters; they appear in Eastern Massachusetts during the last week in April, before those of any other plant of this class, and at a time when comparatively few other shrubs are in bloom. Their brilliancy and cheerfulness, and the splendid colour the leaves assume late in the autumn, make this little *Rhododendron*, which is very hardy, a most desirable inhabitant of northern gardens.

*Rhododendron mucronulatum*,\* which the Russian botanist, Maximowicz (who had made a special study of these plants), considered merely a geographical variety of *Rhododendron dauricum*, inhabits south-eastern Siberia, Russian Manchuria, and Northern China. *C. S. S.*, in "Garden and Forest."

\* *Rhododendron mucronulatum*, Turczaninow, *Bull. Soc. Nat. Mosc.*, 155 (1857); *Fl. Baicalensis-Daurica*, ii., 208. — De Candolle, *Prodr.*, viii., pt. ii., 347. — *Rhododendron dauricum*,  $\beta$  *mucronulatum*, Maximowicz, *Mém. Acad. Sci. St. Pétersbourg*, sér. 7, xvii., 43 (*Rhododendron Asiæ Orientalis*).

## PINUS PINASTER PROLIFERA.

This is not only a distinct but very remarkable form of the Cluster Pine, while at the same time, even under the very best cultivation, it cannot otherwise be described than as an ugly, wretched-looking, and ungainly tree. Some of the oldest specimens I have observed were growing near the remote village of Penryn in Cornwall; but which, although ample room for development has been allowed them, are no ornament to the position they occupy, and in consequence several have already been removed. The largest hardly exceeded 30 feet in height, and all were remarkable for their contorted and half-dead appearance, caused by the stout, tortuous branches having died-back, and yet remained in position, for fully half the height of the tree. The immense clusters of small cones adhering to the long dead branches further added to the weird appearance of these Pines; and in several instances I counted fully sixty cones in a

Kew, but there is none that equals this in the richness and brightness of its flowers. They are borne in rather small trusses (about 4 inches across), each flower being a little over 1 inch in diameter. The colour is a deep blood-red, and the trusses, when the sun strikes them, are lit up into glowing balls of fire. At Kew this species is perfectly hardy, and provided the flowers are shaded from the morning sun long enough for them to thaw slowly, they will stand 7° or 8° of frost without harm. Certainly they are the least susceptible to injury from frost of all the early Rhododendrons. This matter of shelter on the eastern side should always be considered when planting early-flowering kinds. Considering the hardiness and extraordinary beauty of *R. fulgens*, it appears strange that it has scarcely, if at all, been made use of by the hybridiser. The influence of *R. arboreum*, on the other hand, is seen in numerous golden varieties, although it is no richer in colour,

sample of the many now flowering at Arddaroch; and with them was a very handsome *O. × Humeanum* and *O. crispum*.

## ORCHIDS AT TRING PARK.

In the Right Hon. Lord Rothschild's gardens, the *Dendrobium Wardianum* and other showy *Dendrobiums* have been remarkably fine, and a group of them arranged by Mr. Hill, the head gardener, at the entrance of one of the span-roofed Orchid-houses is an admirable display. The stout arching floriferous pseudo-bulbs of the *D. Wardianum* suspended overhead droop over the plants arranged on the staging, among which variety in form and colour is given by well-bloomed specimens of *D. crassinode*, *D. Findlayianum*, *D. luteolum*, *D. × Ainsworthii*, &c. In the centre of the group is a very large plant of a noble variety of *Dendrobium fimbriatum oculatum*, its tall stems bearing on the upper portion racemes of large flowers of an orange colour.

FIG. 61.—ROLLESTON HALL, BURTON-ON-TRENT. (SEE P. 419.)

single cluster of not more than a foot in length. In some of the cottages these huge clusters of cones were used as ornaments, that portion of the branch on which they grow being inserted in a wooden stand. I counted sixty-five cones, each fully 2 inches long, in one of these ornamental clusters. Even in colour and shape the cones are exact miniatures of those of the species; the leaves are only about half as long, and the bark is of a very dark brown colour and flaked. [On p. 420 is reproduced an illustration of a similar malformation in the Scots Pine.] *A. D. Webster.*

## TILIA DASYSTYLA.

This is said to be the finest species of Lime-tree to plant in avenues, owing to the pyramidal form of the crown, ample foliage, and fresh green colour of the same. The tree will grow in almost any kind of soil, it flowers abundantly, and the flowers have a stronger perfume than any other Lime.

## RHODODENDRON FULGENS.

Of the Himalayan Rhododendrons that are really hardy in the London district, this is certainly the most striking; but although introduced in 1851, it is still one of the rarest. Several species and varieties of Rhododendrons are in bloom now in the open at

and is much more tender than *R. fulgens*. The plants of the latter at Kew are 5 to 8 feet high, and nearly every branch carries its crown of flowers. *W. J. B.*

## ORCHID NOTES AND GLEANINGS.

## ODONTOGLOSSUMS FROM ARDDARROCH.

A SET of a dozen varieties of the kind known in garden—as *O. Andersonianum* and *O. Ruckerianum*, &c., comes from Mr. G. Roberts, gardener to R. Brozman-White, Esq., Arddaroch, Garelhead, N.B., and they seem to offer an excuse for the bewildered botanist who saw similar varieties one at a time in succession, and gave them distinct specific names, so very dissimilar are the extreme forms. *O. Andersonianum* Holfordii is by far the finest in shape, approaching *O. crispum*, the spotting of its clear primrose-yellow flowers being very effective. One handsome form is spotted with dark purple and tinged with rose; another rather narrow-petalled variety is 4 inches across, and bright yellow, with a small cluster of spots on each segment; and yet another seems identical with *O. hebraicum*. These are but a

sample of the many now flowering at Arddaroch; and with them was a very handsome *O. × Humeanum* and *O. crispum*.

It is a noble variety of a species which varies considerably, but rarely assumes such stature and beauty as here seen. Among the *Cattleyas* some of the *C. Trianaei* still remain in bloom, as well as good examples of *C. Walkeriana nobilior*, *Laelia cinnabarina*, and other of the dwarf *Laelias*. The rose-scented *Trichopilia suavis* were remarked, and a pretty group of the later-flowering hybrid *Calanthes*. In the *Odontoglossum* house is a very pretty and interesting series of varieties of *Odontoglossum Andersonianum*, varying considerably, a remarkably handsome creamy-yellow *O. × Humeanum*, with dark reddish-brown spotting on the sepals and lower halves of the petals; the white, unspotted *O. nebulosum candidulum*, two really handsome *O. × Coradinei*, *O. Inteo-purpureum sceptrum*, *O. triumphans*, the orange-scarlet *Ada aurantiaca*, and some showy *Masdevallias*, of which the most attractive at present are *M. Veitchii grandiflora*, and some distinct varieties of *M. ignea*.

In the remarkable collection of rare Orchids of botanical interest formed by the Hon. Walter Rothschild—who in the matter of plant culture, as in all the branches of natural history which he takes up, leans to the scientific rather than to the showy side

of the subject—a great number of interesting plants are in bloom, and we noted *Epidendrum Schomburgkii*, a graceful species, with heads of brilliant vermilion-red flowers, each about 2 inches across, the column being orange colour—a very rare and pretty species; the modest little *Epidendrum Linkianum* and *E. polypetalum*; the pretty *Chondrorhyncha Chestertoni*, which few succeed in cultivating satisfactorily, but which does admirably and flowers continuously here, as do also most of the plants of similar habit, such as the lesser *Zygopetalums*, *Z. (Kersteinia) gramineum*, the singular and elegant little *Koellenstenia (Aganisia) graminea*, the pale yellow *Stenia pallida*, and others, being in bloom. One of the most graceful and fragrant of the small white-flowered *Dendrobiums* is *D. lingueforme*, which is grown suspended in a compact tuft, which is now covered with blooms. Other singular-looking or attractive specimens in flower are *D. Moorei*, with pretty little white flowers; *D. tetragonum*, purplish and spider-like, every stem flowering; *D. glomeriflorum*, flowering in bosses from apparently dead stems; *D. platynealon*, whose singular pseudo-bulbs are flat, as though compressed to the utmost, the cream-coloured flowers appearing at intervals at the edges; and many other species.

In one group were remarked several examples of *Lelia flava*, which growers used to think was unmistakable, by reason of its bright chrome yellow flowers, but here *L. flava aurantiaca* has rich orange-coloured flowers, and others are bright red. The fine collection of botanical Masdevallias here in bloom includes varieties of *M. Chimera*, *M. radioa*, *M. Schroderiana*, the true *M. pachyura*, with sprays of rather large yellow and brownish-red flowers; the small-growing *M. Wendlandi*, covered with white flowers appearing above its tufted leaves, and which is grown rather warmer than the other species; the mossy-stemmed *M. muscosa*, with its sensitive labellum which closes like a trap on being irritated; *M. × Courtauldiana*, *M. × Hiucksiana*, *M. Ehippium (Trochilus)*, *M. Schlimii*, *M. triangularis*, *M. Wageri*, *M. Estrade*, and other species. With them are all the obtainable species of *Restrepia*, *Pleurothallis*, *Octomeria*, *Stelis*, &c., some of each genus being in bloom. Of the *Cirrhopetalums* and *Bulbophyllums*, *C. Thouarsii*, *C. guttatum*, *C. picturatum*, and *Bulbophyllum Sillimanianum*, a charming bright yellow species, are in bloom.

Among other remarkable things noted were *Catasetum Warszewiczii*, Lindl. (*C. scurra*, Rehb. f.), a pretty and delightfully fragrant flower; *C. discolor*, and other *Catasetums*; *Eulophia scripta* with a fine branched inflorescence of yellow and red-brown flowers; *Aerides cylindricum*, the plant illustrated in the *Gardeners' Chronicle*, now flowering again; *Eria aridostachya*, an ornamental plant with graceful if not showy flower-spikes; *Aspasia lunata*, *Maxillaria variabilis*; *Loekhartia pallida*, with flattened stems and curious yellow flowers; *Bifrenaria Harrisonae*, and *B. vitellina*, two very dissimilar members of the same genus; *Phaius maculatus*, and *P. Sanderianus*, a remarkable *Stanbopea*, and a small unknown *Polystachya*, remarkable for its delicate odour; the rich yellow *Oncidium chrysomorphum*, the singular *O. didon* and other botanical *Oncidium*s, *Spathoglottis aurea*, and many other singular species—truly a remarkable record for a private collection.

In a warm moist house a giant *Grammatophyllum speciosum*, the largest in Europe, but which although growing freely, bears out its character for being difficult to flower, was observed. Wintered in the same house is a monster tortoise, said to be over one hundred years old.

VANDA BENSONI (*Buteman*) VAR. "TRISTER" (*Parish*).

A dark-coloured variety of this well-known plant, the flowers sulphur-coloured outside, and dirty brown within; the claws of the sepals and petals are more reddish than brown, the tessellation of the flower is a little more distinct than in the typical form. The lip is whitish-yellow, with clear green uncinuate anterior side lobes. As the flowers I received from Messrs. F. Sander & Co., St. Albans, agree in all cha-

acters with those of the typical plant, I assume this must be the form called "Trister" by Rev. — Parish, mentioned by Sir Joseph Hooker in *Flora of Brit. Ind.*, vol. vi., p. 51. Varieties of *Vanda Bensoni* are very scarce, and, except this short note, I have not found another remark in garden or botanical literature. It is well known that *Vanda Bensoni*—the type—is more striking and interesting than beautiful in the common meaning of the word, so it is the same with this variety. *F. Kraenzlin*.

#### VANDA BICOLOR, Griffith.

This very rare species was first described by Dr. Griffith, in his posthumous papers *Natalia*, iii., 354, his *Litrary Notes*, 132, and figured in his *Plantae Asiaticae*, t. 330. If we omit a short remark by Reichenbach twenty years ago (*Gardeners' Chronicle*, 1875, p. 629), the literature about this plant is more or less a reproduction of Griffith's original description. The foliage of the plant is rather stout, and thicker than in the allied species; the top of the leaf is, of course, oblique, very unequally two-lobed, with a sort of angle or edge on the inner side of the longer side (a peculiarity called by Dr. Lindley "subtridentate"). The flowers have white stalks nearly 2 inches long, with three very sharp edges immediately below the flower. The odd sepal and the falcate drooping petals are of about the same size, cuneate-ovate, and as the edges are bent backwards, they appear narrower than they are; the side sepals are twice as large as the three other segments. All these are whitish outside, and within of a dirty-brown colour, with darker tessellations. The side-lobes of the lip are very large, nearly semicircular, whitish with yellow borders; the middle lobe almost triangular, with a cordate base, and a blunt bidentate apex, and except for two small callosities at its base it is quite smooth. Its colour is a very clear and beautiful lilac, contrasting prettily with the other segments. The spur is short, blunt, somewhat compressed, and without any characteristic details. The whole flower measures nearly 2 inches across. The edges of the sepals and petals are rolled back, but not waved, a peculiarity which contributes very much to the characteristic appearance of the flower.

The plant is still very rare in our collections. I received fresh flowers from Messrs. F. Sander & Co., St. Albans, who imported it last year. Sir J. Hooker relates that the plant was collected in the tropical parts of the Himalaya, in Sikkin, Bhootan, Assam, and other countries, at about 2000 feet elevation above the level of the sea; and we may therefore assume that it is a hot species. *F. Kraenzlin*.

## FOREIGN CORRESPONDENCE.

### HORTICULTURAL EXHIBITION AT CANNES.

Owing to the very mild winter, the annual exhibition at Cannes, which was held on March 19 and four following days, was this year far in advance of other years in the quality and number of the exhibits. The great feature of the show was the display made by Messrs. Vilmorin, Andrieux, & Co., Paris, which occupied one large tent. Their various exhibits were artistically arranged in groups, each forming a feature in itself. These consisted, among others, of a group of well-flowered *Cannas*, amongst which I noticed several meritorious novelties. In a group of *Primulas*, several new shades of colour were remarked, but the plants were lacking in the compactness and floriferousness of the older varieties. A group of spring-flowering bulbs was furnished with a groundwork of a new pure white *Ionopsidium*, which is an improvement on the old *I. acule*. *Cinerarias*, and one of *Cyclamens* were represented by very fine, well-flowered plants, and of excellent strains. In the centre was a large group of flowering annuals, which showed what may be had in flower at this season of the year among these plants.

A large bank of vegetables at one end of the tent consisted of excellent samples, which had been grown at Messrs. Vilmorin's branch establishment at Antibes, as were, indeed, most of the plants they exhibited. In an adjoining tent was a very fine group of new seedling *Anthuriums* from the Villa Crombez, including several very fine hybrids of the *A. Andreanum* type. The firm of Solignac was represented by a very effective group of *Azaleas*, backed with white *Lilac*, a small group of *Orchids*, and a variety of flower-baskets and vases. *Carnations* were not largely represented. A new primrose-coloured variety called *Soleil de Nice*, of free-flowering habit, was shown by M. Ginells, a nurseryman near Nice; it is a variety likely to become very popular. Amongst a group of cut flowers exhibited by Falconis, the famous *Carnation raiser* at Antibes, I remarked several very fine varieties, including *Mille. Aug. Falconis*, delicate rose, and of very fine form; *Léon Aicrange*, bright scarlet; *Chas. Swartz*, pale primrose, fine form; *Madame E. Dollfus*, amber, striped red; and *Madame Chas. Molin*, a very large-flowered, deep rose-coloured variety. Many other groups of spring bulbs, *Cinerarias*, *Azaleas*, and floral decorations of less importance helped to make up a very nice show.

### PALMS AT VILLA "LA CHUSA," MENTONE.

Situated in a very sheltered spot, about ten minutes' walk from the Italian frontier, is to be found one of the most interesting gardens in the whole Riviera. Mr. Kennedy, its proprietor, certainly could not have chosen a more favourable spot, with the mountains running up almost perpendicularly from this garden, protecting it from all cold winds. Mr. Kennedy has long made a special study of Palms and their nomenclature, and the list appended will afford readers of these lines an idea of what may be grown here under favourable conditions.

*Chamaedorea elatior*, *C. glaucifolia*, *C. elegans*, and *C. Alexandrea*, all in perfect health. *Livistona oliviformis* (true), 15 feet, has fruited; *L. inermis*, 20 feet, bearing flower-spikes; *Washingtonia robusta* trunk 3 feet in diameter, and with over 100 leaves; *Kentia Fosteriana*, 14 feet high, with eighteen leaves, now flowering for the first time; *K. Balmoreana*; *Ptycosperma Cunninghamiana*, 24 feet high, has fruited; *Areca sapida* is flowering; *A. Baueri*, *Brahea dulcis*, *B. Roezli*, *B. Egregei*, and *B. calcarea*. These are a few of the more interesting species, and there are many more worthy of note. Amongst the species of *Phoenix* I noted a fine plant of *P. senegalensis*, with its highly-coloured fruit; a very healthy little plant of *P. Robelini*, and a fine one of the true *P. argentea*. The genus *Phoenix* is very largely represented in this garden, and it has long been the study of Mr. Kennedy to try and classify them. It is to be hoped that a record is being kept of his work, which may some day be of great value, as the genus has long been a source of trouble to botanists, owing to one species crossing so freely with another. Amongst other plants I noted *Bignonia Chere* and *B. venusta* flowering in profusion, and a very fine flower-spike of *Doryanthes Palmeri*. A very fine tree of *Wigandia caracasana* was bending down with the weight of its immense heads of blossom, a sight which is only met with in the eastern part of the Riviera.

### NYCTERINIA SELAGINOIDES.

With regard to this plant, which was shown in quantity by Messrs. Vilmorin, Andrieux, & Co. at the late flower-show at Cannes, and which is very showy and effective as a border plant, it would be interesting to know if its specific name is correct. Finding it exhibited under this name, and not having known the plant before, I naturally looked for the resemblance of a *Selaginella*, and on consulting the *Dictionnaire of Gardening*, I found it placed under the name of *Zaluzianskia selaginoides* (syn. *Nycteria*). As it closely resembles the *Selago*, from which the name is probably taken, I presume it should read *S. selaginoides*. [No; the genitive of *Selago* is *Selaginis*.] It would be interesting to know if this is correct, as such names are very misleading. [In *Index Kewensis* the plant is named *Zaluzianskya selaginoides*. Ed.] *Riviera*.

## ANGULOA UNIFLORA, VAR.

FLOWERS of a beautiful variety of *Anguloa* were shown by Messrs. Veitch & Sons, of Chelsea, and F. Sander & Co., St. Albans, at the meeting of the Royal Horticultural Society, on March 10 last. The plant was provisionally named *alba magna*, but as we stated in our report of this meeting, p. 337, it turns out to be a variety of *A. uniflora*. The flower is of a creamy-white, minutely spotted with pink (fig. 62).

## THE ROSARY.

## THE PRUNING OF TEA ROSES.

NEXT to time, perhaps the length of pruning is of most importance. Three lengths are generally recognised among rosarians—long, medium, short close, or hard. Among novices, however, the very terms are liable to be misunderstood. The writer has met with growers who interpreted long pruning by the measure or length of the shoots cut off, whereas, of course, all experienced rosarians know that it derives its name from the length of the shoots left on the Rose-bush or tree. In long pruning, comparatively few buds are cut off, and many are left on. In short pruning, many eyes or buds are cut off; a few, from one to three, are left on. Medium pruning strikes the happy mean between the two extremes of length in pruning, which may possibly reach from an inch to 144 inches. Both these lengths may be described as extremes, and the average ranges of length included in the ordinary pruning of Tea Roses may mostly be found within the range of from 3 to 12 inches; but these hardly touch the special training and pruning of trees on walls, or as rough bushes, pyramids, cloths of summer-houses, verandahs, church steeples, or other tall buildings, in which not a few Rose-shoots are treated as biennials, to the renewing of the youth and enhancing of the beauty of the Roses. Thus the length of pruning of Tea Roses gets very much mixed with the form, size, vigour, or character of plant desiderated. For example, the removal of exhausted boughs, limbs, or branches, and the provision of young ones to furnish vacancies, in fact or in prospect, are often of the utmost practical importance, though outside the range of the common routine-pruning of Roses for bloom, chiefly or only. Again, rosarians should prune their Tea Roses for form, stability, the concentration of as much verdure and beauty as may be into limited areas. As already stated, there is an almost infinite diversity of habit, strength, form, and extent of growth among Tea Roses. Hence, if beds, groups, masses, or borders of Tea Roses are to preserve any approximation to symmetry or congruity, pruning will have to be prudently and judiciously used. Tall, thin, and lanky Teas are less effective or profitable than shorter, stouter, rounder heads or bushes. Standards, Pyramidal, or scrambling Roses may also be moulded into more pleasing as well as profitable forms through judicious and timely pruning.

Some of the thinner and longer-budded and more slender-growing Teas lend themselves readily to the formation of shower, weeping, or drooping Roses for the clothing of arbours, arches, poles, triangles, crosses, trees, steeples, trellis-work, walls, or buildings. Niphetos, Luciole, Madame Cusin, Madame Falcot, Sunset, L'Idéale, and Wm. Allen Richardson, are useful for this style of growth and graceful mode of furnishing. Maréchal Niel, Gloire de Dijon, and most of its family, and such Noisettes as Lamarque and Aimé Vibert, as well as Homère, form splendid material for drooping down from pollards or showering over arches. For laying the foundation of shapely standards or dwarf bushes, the rather short pruning of Teas is, on the whole, best. Rosarians, like fruit-growers, generally like to keep their harvests of beauty as near home as may be. Hard pruning at first greatly contributes to this result. In pursuit of this object we are brought back to close-budding as well as hard-pruning, and here, at least, there is a general consensus of opinion among rosarians. We

cannot get our Rose-buds too near to the base of our Briar shoots, as all the Briar left is only a useless breeding ground for troublesome and useless suckers. The number of shoots budded on the Briar may often also materially affect the mode or length of pruning adopted. Perhaps on the whole the best, certainly the most rapid mode of budding Roses is to place one bud only on a Briar, selecting always the strongest and best-posted shoot for budding. But many rosarians prefer two, some three or four, as many as four or five buds on their standard Briars.

The more Rose-buds inserted at first, the closer or harder the Roses should be pruned afterwards, and this to prevent overcrowding. Supposing, for example, we start forming our Rose-heads from five distinct centres or heads: one good shoot from each would prove

FIG. 62.—ANGULOA UNIFLORA, VAR. : CREAMY-WHITE, WITH PINK SPOTTING.

enough material and to spare for furnishing a head; but should we start from one centre, it is good practice to leave at least three buds for furnishing purposes; and this numerical start, with its multiples, will speedily furnish a sufficiency of furnishing and flowering wood for our Tea and other Roses. Many of our Tea and other Roses also make less growth as they get older. Such may be more closely pruned, and so long as buds are cut back to a bud, pointing outwards from the main shoots, there will be little danger from inter-crossing or over-crowding.

Medium and long pruners contend that they have a larger choice, a richer pick of wood or buds than the hard or short pruners. And so they have. But the advantages are more limited than appears at first sight. I know that there are rosarians who contend that the best blooms are cut from the tops, others are

equally confident that they come from the middle and yet others that they spring from the base of the shoots. And Rose-growers writing or speaking thus, treat the shoots as a unity, while we all know that the shoots of Tea Roses are at least dual, if not trio productions, the first or major portion grown before midsummer, all above and beyond this afterwards.

Now there are very few rosarians that go in search of their finest flowers among the soft and somewhat late or spongy growths, and if they did, the weather and the climate would most seasons reap the richer harvests. Practically, these vital and physical conditions powerfully affect our times, and modes, and length of pruning. As a rule, with not a few exceptions, it sends Rose growers back to the first or summer-made wood of their Tea Roses for their reserve of growing wood for furnishing their Rose trees and bushes, and also for their best-formed, deepest-coloured blooms. Safely landed on this early-made, firmly-compacted, well-matured wood, an inch or two less or more in the length of the cut, or a bud or two less or more left, will only afford a wider scope for disbudding, and result in more perfect blooms. Whatever mode of pruning Tea or other Roses is adopted, it can hardly be called complete until supplemented by careful disbudding, which affords a final opportunity of weeding out all the failures of the current season, as well as any old wood that has failed to break or bloom as expected. Amid all our diversities of pruning Roses, this general law prevails: the stronger the growth, the less pruning; the weaker, the more. Finally, late budding is almost our only antidote to early growth. Maiden buds inserted last August and September are still sound asleep through this winterless winter on the 23rd of March, though yesterday and to-day are more like midsummer than the first days of spring. *Rosa*.

## CATALPAS.

LIKE a large proportion of our hardy trees and shrubs, the Catalpas are represented in both the Eastern and Western Hemispheres. In the *Index Kewensis* eleven species are recognised, but of these there are only seven of which anything definite is known. Three are natives of the West Indies, two of North America, and two of China. The following are the only species hardy in Britain:—

## NORTH AMERICAN.

1. *C. bignonioides*, *syn. C. syringifolia* and *C. cordifolia*.
2. *C. speciosa*.

## ASIATIC.

3. *C. Kämpferi*, *syn. C. ovata*.
4. *C. Bungei*.

These, especially the American ones, are amongst the most beautiful of all hardy trees. Their leaves are of large size and bold outline, and give the trees a striking and distinctive appearance even when they are out of flower. In good, and especially in moist soil, the Catalpas grow rapidly. Owing to the branches never forming a terminal bud, they have largely a dichotomous arrangement, and this, in open situations, naturally produces a short trunk and broad spreading top. Young trees, therefore, especially when destined for street planting, require to be carefully kept to a single lead, and perhaps staked, in order that a clean trunk of the desired height may be obtained. The moisture-loving propensities of the Catalpas render them specially adapted for planting in riverside avenues, near ponds, &c. They can be easily propagated by cuttings both of the stem and root. The former should be made as soon as the young leafy shoots are moderately firm, and placed in a mild bottom-heat in a propagating-frame.

Whilst in Britain it is scarcely likely that the Catalpas will ever acquire any value as timber trees, the wood of the American species has been extensively used in the United States. Although soft, it has, for certain purposes, such as the making of fence-posts, &c., proved extremely valuable on

account of its power of resisting decay when in contact with the soil.

*C. bigonioides*.—This is the commonest of the cultivated Catalpas, and its introduction to England dates back further than that of any other. By Loudon it is said to have been first brought from the United States in 1726. It was figured by Catesby in his *Natural History of Carolina* in 1731. Although in its native country it occasionally reaches a height of 50 to 60 feet, one rarely sees it more than half as high in England, unless drawn up by surrounding trees. The leaves, which occur in twos or threes at each node, are pubescent on both surfaces when young, but afterwards become quite smooth on the upper side; they are broadly ovate, measuring on adult trees 6 inches in length by 4 or 5 inches in width. On young specimens they are frequently twice as large. It flowers in July, bearing large terminal erect panicles, the individual blossoms of which are 1½ inch across. The corolla has a broad tube and a spreading limb with a frilled margin; it is creamy-white, with yellow blotches and clusters of purple spots on the lower side. The thin, capsular fruits vary in length from 6 inches to over 1 foot. It is a native of Georgia, Carolina, Florida, &c.

Vars. *aurea* and *purpurea* have golden and purple leaves respectively. Var. *nana* is a very dwarf form, which never flowers.

*C. speciosa*.—Although this species has been known for a good many years, it was for a long time confounded with *C. bigonioides*. It is, however, quite distinct; and as it thrives in parts of the United States where the winters are too severe for its fellow species, it is likely to prove the more valuable of the two, especially as it is quite as handsome. Professor Sargent says that in the forests it is occasionally met with over 100 feet high, but that in the open its height is rarely more than 50 feet. Its leaves differ from those of the last species in being larger, and in having the apex drawn out into a much longer, acuminate point. The panicles have fewer flowers, but the latter are considerably larger, measuring 2½ inches in diameter. The corolla is white, and it has the same series of yellow blotches as *C. bigonioides*, but the spots of purple on the lower lobes are less numerous. I do not think the species has flowered in England, but it has flowered under the more rapidly-maturing climate of the continent—a coloured picture of it may be seen in the *Revue Horticole* for March, 1895. It flowers a week or two in advance of the other American species. In a wild state it affects moist and often inundated land. The value of the wood of the American Catalpa has already been alluded to. Professor Sargent, in the *Silva of North America*, cites an extremely interesting example of the power of the wood of *C. speciosa* to withstand submersion in water. After the earthquake of 1811 in Missouri, a large tract of land sank, and eventually became submerged, and a great number of this Catalpa and other trees growing there were killed. Sixty-seven years after, the Catalpa trunks were still perfectly sound, whilst all the trees among which they had once grown had decayed and disappeared long before. It is a native of Kentucky, Texas, Tennessee, Louisiana, and several other States, its habitat being more western than that of *C. bigonioides*.

*C. Kämpferi*.—Up to within the last few years, and before the restrictions against foreigners travelling into the interior of Japan were removed, this species was thought to be indigenous to that country, where Kämpfer first saw it over 200 years ago. It is really a native of China, and only exists in Japan as a cultivated tree. It has been noticed chiefly in the vicinity of Buddhist temples. Siebold introduced it to Belgium in 1849. It reaches a height of 20 feet in Britain—probably more in Japan—and has the same round-topped habit as its American allies. It is not, however, so handsome a tree, and never attains to so great a size. Professor Sargent says that in the United States it has proved hardier than the native species; so it is probable that in Great Britain it might be grown further to the North than they can. The leaves are usually ovate, frequently

lobed, and measure about 6 inches each way; when young, they are pubescent, afterwards becoming glabrous above. The flowers are smaller than those of *C. bigonioides*, being about 1 inch in diameter: they are pale yellow, spotted with reddish-brown or dull purple, the margin of the corolla being lobed and frilled.

*C. Bungei*.—The true *C. Bungei* has not long been in cultivation, and of several young trees in the Arboretum nursery at Kew, none is as yet large enough to flower. It is a native of North China, where it is a tree 30 feet high. The leaves are lobed, or nearly entire, usually of triangular shape, with a long acuminate apex. They are 3 to 8 inches long, and from 2 to 5 inches wide. It has not flowered in Europe, but is apparently superior to *C. Kämpferi*, both panicles and individual flowers being larger than in that species. The corolla is white, spotted with purple. The name is not infrequently met with in gardens and nurseries, both of this country and the Continent, but is nearly always erroneously applied to *C. Kämpferi*, or merely dwarf forms of *C. bigonioides*.

*C. × J. C. Teas* (Teas' Hybrid Catalpa).—This is a hybrid which originated with Mr. John C. Teas, in his garden in Indiana, U.S.A., about twenty years ago. Its parents are the Japanese *C. Kämpferi* and the American *C. speciosa*. It is in cultivation at Kew, but has not yet flowered. From the descriptions given of it, as seen growing in the United States, it would appear to be the finest of all the Catalpas, surpassing even *C. speciosa* in the vigour of its growth. The flowers are produced on enormous panicles, as many as 400 of them occurring on one panicle; they are white marked with minute purple dots, and a patch of yellow. Having the two hardiest species for its parents, and being more beautiful than either, it is certainly a plant which English tree-lovers ought to look after. *W. J. Bean, Arboretum, Kew.*

## POULTRY-MANURE FOR THE GARDEN.

QUESTIONS are frequently asked about the value of poultry-manure for garden purposes. The real facts about the case are, that this substance is decidedly richer in plant-food than the dung of other animals, because it contains both the solid and liquid excrements combined, and is somewhat analogous to guano in character, though far less valuable than guano weight for weight. To begin with, the food of hens, of pigeons, and even of turkeys, except in grasshopper season, is of vegetable rather than of animal origin, while the sea-fowl that produced the guano lived upon fish, and consequently voided a more highly nitrogenised excrement; and, moreover, the guano has become exceedingly concentrated by the peculiar processes of slow decay to which it has long been subjected. It is well known that the dung of cows, horses, pigs, and sheep, contain comparatively little of the animal urine, unless absorbents in the form of good litter have been freely used. Nitrogen, the most valuable part of animal manure, is voided mainly in the liquid excreta. For example, 1 ton of horse-droppings contain 17 lb. of nitrogen and 13 lb. of potash; while 1 ton of horse-urine contains 42 lb. of nitrogen and 33 lb. of potash. Again, sheep-droppings contain in each ton, 20 lb. of nitrogen and 14 lb. of potash; while the same weight of sheep-urine contains 33 lb. of nitrogen and 44 lb. of potash. Hence, if both the solid and liquid excrements are obtained together as in poultry-manure, nitrogen, the most expensive element of plant-food, is saved, and is combined with larger quantities of potash and phosphates. We see in the case of guano that sea-fowl excrements depend for their manurial value very much upon the character of the food consumed; so it is in the case of domestic poultry. In some experiments recently conducted it was found that a pen of fowls fed on a concentrated mixture as follows—Wheat-bran 3 parts, Linseed-meal 4 parts, ground Oats 6 parts, gave a manure containing 1·8 per cent. of nitrogen,

2·2 per cent. of phosphoric acid, and 1·1 per cent. of potash; while another pen of fowls fed on Maize-meal alone contained on analysis 1·5 per cent. of nitrogen, 1·9 per cent. of phosphoric acid, and 1 per cent. of potash. Thus the fowls receiving the concentrated food yielded a manure containing one-fourth more plant-food than the Maize-meal fed fowls.

The value of fowl-manure further depends, and very widely differs, according to the description of bird that has produced it, as is shown by the following table:—

*Selected Constituents in One Ton of Fowl Manure (Fresh)*

	From	Nitrogen.	Potash.	Phosphoric Acid.
		lb.	lb.	lb.
Hens	... ..	43	19	59
Pigeons	... ..	47	25	41
Ducks	... ..	27	13	31
Geese	... ..	15	21	12

These figures show that the excrements of the duck and of the goose are far inferior in manurial value to those of the hen or pigeon, owing to the fact that the former birds consume water in such large quantities. It has been computed that a hen yields 12 lb. of dung in a year, a pigeon 6 lb., a turkey or a goose about 25 lb. each, and a duck 18 lb. These weights of dung are reckoned as air-dried.

It should be borne in mind that nearly one-half of the nitrogen in poultry-manure, which exists very largely in the form of carbonate of ammonia, may be lost by evaporation, and, as we have already stated, this element being the most valuable part, care should be taken to preserve it in the dung. This may readily be done by freely using an absorbent under the fowl-roosts, also using it in the heaps in which the manure is kept, and keeping the excrements sheltered from moisture or heat. Dry earth, gypsum, peat, or even finely-sifted coal-ashes make excellent absorbents. Do not, however, use either lime or wood-ashes; because these substances tend to liberate the ammonia in the dung.

Since poultry-manure is apt to be sticky when fresh, and lumpy when dry, it is not particularly well fitted to be used as a concentrated fertiliser; it may, consequently, well be relegated to the compost-heap, as a general rule. It is to be observed, however, that much of the nitrogen in the dung of birds is in the form of uric acid—a substance directly assimilable by plants, and easily converted into oxalate of ammonia by putrefaction. Plant-food in poultry-manure being thus mostly in a very soluble form and quickly available for crops, it may be used to give young plants a good start, or employed for quickly-growing crops. For many horticultural purposes, also, it may be well to turn over the heap of poultry manure, or of compost made from the same, many times and often, in order to provide delicate food for some cherished plant. *J. J. Willis, Harpenden.*

## CŒLOGYNES AT WOOLTON WOOD.

THE cultivation of Orchids has been for a long period of time carried on with most satisfactory results in Mr. H. Gaskell's garden at Woolton Wood, Liverpool, and numerous notices of the plants in these pages will be in the recollection of those of our readers who are interested in Orchids and their culture. The plants seen in our view of the house (fig. 63, p. 425), show by their large size and floriferousness, the perfection of cultivation.

## EARLY SPRING FLOWERS.

COMING into flower sometimes before Christmas, as some of these do in mild seasons, the term "Winter Flowers" would not be inappropriate; but as only very rarely appearing in sufficient quantity to make a good show until the end of January and onwards, they are valued chiefly as harbingers of spring, and

as giving assurance that our plants will again awaken from their period of rest, and put forth blossoms and leaves—and to some they speak of higher things than these. We all value these early flowers perhaps more than the showier inhabitants of the garden which appear later in the year. The commonest of the early flowers is the Snowdrop, *Galanthus nivalis*, prized of all; but there are several species or varieties which come almost as early as this one, and are as easily grown, and which have some slight difference in colour, size, and form.

*Snowdrops*.—The common variety, *G. nivalis*, is one of the best of flowers for naturalising on grass, and in

*Crocus imperati* is valuable alike for its earliness to flower and the beauty of the blossoms, often opening before Christmas, and lasting a long time in good condition, if frosts are not very severe. It is a plant that needs to become well established to have it in full beauty, as after remaining a few seasons undisturbed it forms compact masses, and its blossoms withstand rain and wind much better than in small, thin, scattered clumps. The plant grows from seed shed naturally on the ground at this place, although it gets nothing special in the way of soil or treatment, with the exception that it is grown on the borders, and not amongst grass. Like all those mentioned below, it

some of the flowers coming almost white. It is of very dwarf habit, and the flowers are often 2½ inches in diameter when expanded; its habit of closing up in dull and showery weather accounts for the long period during which the flowers remain in perfection. The varieties *A. b. Seythiana* and *Cypriana* are very pretty, but are a trifle later in flowering. The former is pure white, the latter blue outside and white within, and very pretty when half expanded.

*Anemone fulgens*.—Few flowers surpass this for effect when seen in a mass during March and April in mild seasons; if planted early in a sheltered posi-

FIG. 63.—CÆLOGYNES IN MR. H. GASKELL'S GARDEN, AT WOOLTON WOOD, LIVERPOOL. (SEE P. 424.)

favourable soils and situations the patches increase rapidly in size. It is sometimes to be seen planted in fantastic patterns, but these seldom look well, and the best way to plant is in clumps of a middling size in an irregular manner, which holds good of all of the plants previously mentioned. Snowdrops are so accommodating as to soil that I do not remember an instance where they have not thriven, no matter what the soil or sub-soil on which they were planted. The single forms are, in my opinion, superior in point of beauty to the doubles, but both seem to last in good condition equally well. Snowdrops, if planted amongst *Eranthis hyemalis*, make a harmonious combination of foliage and flowers, and blossom at the same time.

should be planted before the middle of the month of August in a sunny position, for the reason that the flowers only open in the sunshine, a very little of which, however, suffices to expand them and show the purplish crimson interior.

*Anemone blanda*.—This is our earliest blue-coloured flower, often showing a few expanded blossoms in December, and continuing to produce them for nearly three months. Like the preceding, it expands only when the sun shines upon it, and should therefore have a place in a sunny part of the garden. This plant also increases fast from self-sown seeds if it be left undisturbed. The only disadvantage to this course is the variation in the colours of the flowers which ensues

tion, it will afford quantities of flowers in January—in fact, like the Irishman's flower, it comes in bloom so early, that it sometimes comes the year before. This plant is easily grown if the following points are attended to, viz., it dislikes fresh manure, and should be planted in ground that has been manured six months previously; after two years' growth it should be lifted when the leaves turn yellow, the roots spread out thinly on dry airy shelves until planting time comes again, and then be placed on a fresh piece of ground, and it should always be planted again before the middle of the month of August. The roots may be broken into pieces not more than half an inch long when replanting, if an increase of stock is wished

for; and the pieces should not be placed deeper than 1 inch below the surface in order that a dressing of burnt earth may be spread over the bed half an inch thick as soon as the planting is finished, which will largely prevent the growth of weeds which are apt to be troublesome in the autumn before the plants appear above the ground. It is a useful flower when cut for indoor decoration, remaining open night and day when in a warm room, and lasts a long time. One of the prettiest ways to employ it is to mix the flowers with those of the yellow Daffodil, and Daffodil foliage, in clear glass vases.

*Chionodoxa Lucilia* is greatly admired by all who see it, the sprays of flowers when fully expanded being light and graceful. Its first flowers opened here this season on March 1. The flower-spike continues to grow and produce flowers for some time, and clumps or beds of it eventually become a mass of flowers. This variety is far prettier than *C. sardensis*, owing to its large white eye, and the greater size of its flowers. It reproduces itself from seed here freely—in fact, it has got so well established in a few years that it is difficult to eradicate, owing to the seedling bulbs being very small during the first two or three years. This plant increases much in strength after the first season, and the spikes are longer and more effective. I find the colour and size of its flowers vary slightly from seed, judging from a few stray plants I have observed. It would appear to be useful for naturalising in the grass.

*Scilla bifolia* is not so bright in colour as *S. sibirica*, but it is far prettier in habit, and comes into flower several days earlier; but it has the disadvantage of fading sooner than some of the above-named flowers. It is, however, worth cultivating, especially the white and pink varieties, which are at the present time very scarce at Belvoir; the normal form increases fast, and does well on our stiff clay.

*Eranthis hyemalis*.—The so-called Winter Aconite is a very pretty flower, and the best of all for naturalising in shady places, under trees, &c. If a few roots are planted, it soon increases from self-sown seed, and forms a mass of golden flowers. The plant is partial to decayed leaves, but grows as well on clay as on limestone; and if it be planted beneath Elm, Lime, or similar soft-leaved trees, the leaves of which for the most part decay before growth recommences, and those that remain undecayed till the end of December should be removed, as in mild seasons the flowers begin to push up soon after that time. I have found this plant to lift without injury when in full flower, and in this way it is a useful one for indoor decoration, being taken up in small clumps and secured in damp moss. It has the habit of growing fast as soon as it gets in a warm room, so that it only lasts about three days; and if the plants are then put out again, they will flower at the usual time the following year. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

#### SHORTIA GALACIFOLIA AS A DECORATIVE POT PLANT.

—My object in writing this note is to point out how useful a plant is *Shortia galacifolia* for early spring decoration. Used as a front-row plant in the greenhouse, in shallow square or round pans, a very pretty effect is obtained from its numerous flowers, which are of pink tint. This plant requires a rather spongy peat, and a small quantity of leaf-soil and sand. The rhizomes should be rather closely laid-in, with the clusters of leaves rising just above the soil, as by so doing a painful affords quite a mass of bloom. The pans should be placed in a shaded cold frame, and watered freely when in growth, allowing always a free circulation of air in the frame. If grown in the direct sunlight, the foliage is less luxuriant, but it has a more reddish hue. When the flower-buds become visible, a sunny position should be given the plants, which hastens slightly its time of flowering. If artificially fertilised, seed is freely produced, which may be sown as soon as ripe on the surface of a peaty mixture, with scarcely any covering, covered with a square of glass, and placed in a cool place. *R. L. H.*

## THE WEEK'S WORK.

### FRUITS UNDER GLASS.

By W. POPE, Gardener, Highclere Castle, Newbury.

**EARLY FIG-TREES IN POT.**—As the fruits show signs of ripening, syringing should be discontinued, and the amount of water given to the roots lessened gradually, or the flavour will be poor. Trees upon which the fruits are still swelling must be allowed an abundance of moisture until ripening commences, when a circulation of warm air is absolutely necessary to secure fruit of the highest quality. The temperature should be 60° to 65° at night, with a rise of 10° in the daytime from fire-heat, and 80° to 85° with sun, admitting air at 75°, and closing early at 85°. As the Fig produces surface roots in greater abundance than most other fruit trees, these should be encouraged by suitable mulchings of partially-decayed rich manure as soon as growth has well commenced, and if this be kept in a moist condition it will become full of active fibres by the time the trees require increased support in perfecting a crop of fruit. In a suitable position, soil, and with thorough drainage, heavy crops of fruit may be obtained, but the trees should be afforded liberal supplies of liquid-manure during the final swelling. Trees in pots will require this more frequently than those planted out, especially where turves, or some similar material, may have been placed over the rims of the pots to encourage surface roots. Continue to pinch the points of the shoots at the fifth leaf, and prevent crowded growths on planted-out trees by thinning. Shading of any kind, by their own foliage or otherwise, is most injurious to the Fig. Ventilate freely during favourable weather to induce stout, leathery foliage, but carefully guard against cold currents of air. Trees under glass-cases or in unheated houses should now have any extra protection removed, and the trees be pruned, thinning-out the less fruitful growths, and removing old and bare shoots. Over-crowding is a common error in Fig culture. In unheated houses it is especially needful to secure all the light and sunshine possible. When growth is sufficiently advanced, pinch the shoots at the fourth leaf to assist the swelling of the fruit, and encourage the formation of short, stout-jointed, spur-like shoots at the base of this season's bearing-wood. Ventilate freely at 50°, closing early at 65° or 70°. The border, if dry, should have a thorough watering, repeating it if necessary till thoroughly well moistened throughout, afterwards mulching it with short manure.

**PLANTING YOUNG VINES.**—This is a suitable time to plant young Vines, as the canes, if cut back early in the winter, and since kept in a cool-house, will probably have made an inch or two of growth. If the canes have not been shortened, do not do this now, or it will cause excessive bleeding, but remove the buds from the upper portion, to the length desired, and shorten the canes later on when in active growth, or they may be left until the winter pruning. When turned out of the pots, the roots should be carefully disentangled, and spread out on the previously-prepared border at their full length, working the soil well amongst them with the hand, and covering them to a depth of 3 or 4 inches. Give a good watering with tepid water, and mulch with short litter. Sprinkle the Vines and borders twice a day, and keep the house rather close until growth commences, when more air should be afforded, and every effort made to obtain sturdy, short-jointed canes.

### THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Oxon.

**HABENARIAS**—These pretty terrestrial Orchids are not sufficiently known or they would surely be more generally cultivated, being in foliage and flower alike charming. Such varieties as *H. militaris*, *H. carnea*, and its white variety *ovata*, *H. Susanna*, and *H. rhodochila*, if properly arranged together when in flower, make pretty and effective groups of plants. These deciduous plants are now commencing to grow, therefore turn the plants out of their pots and remove the old soil, and carefully examine every particle for small tubers. When the plants have been strongly grown, the tubers frequently cling so firmly to the inside of the pot and on pieces of crock, that there is some difficulty in turning them out. Carefully break the pots in such cases, and the roots may then be easily detached from them without injury. These species of *Habenaria* usually increase very freely, and if they were well treated last season and properly rested during the winter months as directed in a former Calendar, more than one new tuber will

be found in each pot. Carefully separate them and repot each singly, using pots as small as possible, those known as long thumbs being preferable for the largest and strongest tubers on account of their greater depth. One very important item in their cultivation is perfect drainage. On no account place a flat piece of crock over the hole at the bottom of the pot, but a hollow piece, and lay a few smaller ones over it. Then place the tuber in the centre of the pot with its base resting upon the drainage, and keep the top of the tuber about half-an-inch below the rim. Fill the space around the tuber with clean crocks to within an inch of the top, then place a thin layer of sphagnum-moss, and fill up with the following compost, just covering the top of the tuber: One-half of good fibrous peat and loam, and one-half finely-chopped sphagnum, a good share of small broken crocks, and a sprinkling of coarse silver-sand. Mix the whole well together, and pot moderately firmly. The first three-mentioned varieties should be placed on the shady side of the warmest house, where the atmosphere is hot and moist. See that the pots be kept close to the roof-glass in good light without sunshine. For the present it is not advisable to afford a decided watering, but merely an occasional spraying with a fine-rose watering-can until the growth has well commenced. The quantity may then be gradually increased, and during quick growth they will take almost any quantity. During bright summer weather well syringe the under parts of the foliage. *H. Susanna* and *H. rhodochila* require the temperature of the Cattleya-house.

**GENERAL REMARKS.**—Owing to the increase of sun-heat at this season, insect pests of every description will begin to make their appearance, and if not checked will multiply rapidly. Green and yellow-fly are sure to be troublesome in the cool-houses, especially on the growths and young flower-spikes of *Masdevallias* and *Odontoglossums*. Small yellow thrips may be looked for in almost every plant in the collection. The remedy against these insects is the XL All Vaporiser. Previous to using the vaporiser, close the house early, and obtain a nice moist temperature, as the fumes from the compound are more effectual in a damp than dry atmosphere. On the day following the operation, examine those plants which are known to be subject to these insects, and if any be found alive, use the vaporiser again in the evening. Black thrips are exceedingly fond of the Australian and New Guinea *Dendrobiums*, also the Mexican *Lelias*, but these insects are not so easily destroyed by fumigation as the yellow thrips; and nothing is so effectual as sponging the under-sides of the leaves with some safe insecticide whenever they make their appearance. White and brown scale, and mealy-bug, also do a great amount of damage, the first two named especially, among such epiphytal Orchids as *Aerides*, *Saccolabiums*, *Vandas*, &c.; while the last insect is generally to be found in the growths of *Epidendrums*, *Compretias*, *Burlingtonias*, &c., also very frequently on the under-sides of the foliage of *Masdevallias*. To keep down these, the brush and sponge must be constantly employed. In the *Cattleya* and Mexican-houses, woodlice sometimes eat the young roots both in and out of the compost, but now that the majority of the plants require more frequent waterings, which woodlice do not like, they may easily be caught by laying pieces of Potato or Carrot upon the compost, which should be examined every night and early morning. Cockroaches must be got rid of by poison or skilful trapping.

### THE KITCHEN GARDEN.

By C. HERRIS, Gardener, Drogheda, Maidenhead.

**SEAKALE.**—Assuming that the site selected for growing the next winter's supply of Seakale roots has been thoroughly prepared by trenching and manuring it, the planting of the sets should now be done. If these were prepared and laid-in in sandy soil two months ago they will have callused, and produced several small shoots, which before the sets are planted should be rubbed off, with the exception of the strongest. The ground should be trodden evenly all over, and the larger stones removed with a wooden rake. This having been done, draw drills of about 1 inch deep and 15 inches apart, and afford a surface-dressing of wood-ashes and soot in the proportion of six of the former to one of the latter, nearly half filling the drills with this. In planting the sets with a dibber, a portion of this dressing is carried down with the set. The top of a set should be 1 inch below the soil when the latter is raked down lightly

which should be done in a line with the drills. If space can be afforded, the sets may be planted 18 inches apart each way; still, strong roots can be grown at a lesser distance apart, and a considerable saving of ground effected when a large number of plants are required. The raising of Sea-kale roots from seed is a slow process, two years' growth being required before roots strong enough for forcing are obtained.

**GLOBE ARTICHOKE.**—The small portion of protecting material yet remaining round about the plants should now be removed, and established clumps of plants afforded a heavy dressing of rotten manure, which should be dug in with a fork. If the plantation is old, and as a consequence unsatisfactory, a new one should be made from the suckers which were potted up for this purpose, or suckers with roots attached taken off the old stools, and planted in clumps of threes set out triangularly 6 inches from each other, the clumps being 3 feet apart in the rows. The ground for a new bed should have been trenched and manured, and the plants should be mulched with half-rotted manure. It is a common practice to destroy a few plants annually—the oldest, and plant rooted suckers; a good method where land is scarce.

**VEGETABLES.**—Successional sowings of Broad Beans should be made, putting the seeds in with a dibber if the soil be light; otherwise double drills 9 inches apart and 2 to 3 inches deep should be drawn, and the Beans set in these at a distance of 6 inches apart. Sutton's Green Giant Longpod is a prolific green-seeded variety; Seville Longpod is a white-seeded variety, and preferable to the Green Windsor for general culture. Where a small Bean is liked, Beck's Dwarf Green Gem may be grown, the seed being sown at half the distances apart given above. Spinach is an important crop, and another sowing of the Victoria variety should be made in an open situation. The earliest Spinach sown between the rows of Peas on a south border may with advantage be cleared off as soon as leaves from the sowing now made are ready for use. A large sowing of Parsley should be made, also of Thyme, Chervil, Borage, Pot Marjoram, and Savory. Basil and Sweet Marjoram which were raised in pans and boxes under glass should be carefully pricked off into others, or planted direct to the border, receiving some kind of protection against frost and cold weather. Early-sown Cauliflowers, Brussels Sprouts, and Protecting Autumn Broccoli should be carefully pricked off into frames, or on to a warm border where some slight sort of protection can be afforded. The last sowing of Ne Plus Ultra French Beans under glass may now be made, the seedlings to be planted out in cold pits or frames when fit. French Beans growing in heat will need careful attention in the matter of watering and syringing, any neglect of the latter tending to an increase of red-spider and consequent deterioration of the crop. Onions now standing in boxes and beds should be hardened off preparatory to planting them out about the middle of the month.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Kettleton Hall, Burton-on-Trent.

**APRICOTS** appear to have set a very good crop of fruit this season considering the changeable weather that has prevailed during the time the trees have been in bloom. On many occasions cold showers of rain, late in the day, have been followed by frost at night, and during such days the temperature has ranged between 60° and 70°. It should be clearly understood that the Apricot produces fruit on the wood of the preceding year's growth, as well as upon spurs, and disbudding or stopping effected accordingly. As soon as the shoots are of sufficient length to be taken hold of with the finger and thumb, all foreright ones, that is, those which spring from the front of the branches, should be entirely rubbed off, as well as others that are not required for extending the branches, or for replacing those shoots now fruiting, or for forming fruit-spurs. The growths left for extension, and those for producing fruit next season, should be carefully selected, choosing those inclined to grow in the required direction; any not required for either of the above purposes should be pinched at the third or fourth leaf. These, together with the natural spurs, which grow about an inch long, should be regulated with due regard to each other, and must not be so numerous as to impede the proper development of the foliage. As soon as the fruits are well set, the trees should be looked carefully over, and the fruits thinned, if necessary, removing first the smallest and those which are growing between the branches and the wall. It is the safer practice to look over the

trees two or three times, taking away a few fruits at each time, but leaving a few more than are necessary for a full crop, until the fruits have passed through the stoning process. Strong growing trees should be allowed to carry more fruit than weak ones. As a guide to the proper number of fruits to leave on a healthy tree, I would say ten to twelve of the smaller-fruited varieties, six or seven of the medium, and four of the large varieties to each superficial foot. During the operations of disbudding, and of thinning the fruits, keep a sharp look-out for the Apricot-maggot, and if any are found, they can be destroyed by pinching the leaves in which it has encircled itself. On the first appearance of aphid, spray the trees with a solution of Bentley's compound liquid Quassia extract, in the proportion of one part extract to fifty parts soft-water, or one part of XL All liquid insecticide to forty parts of soft-water. Use either of these dilutions at a temperature of about 100°, and they will destroy aphid without injury to either the young fruits or foliage.

### PLANTS UNDER GLASS

By JNO. MCINTYRE, Gardener, Woodside, Dartington.

**STROBILANTHES DYERIANUS.**—This plant, sent out by Messrs. Sander of St. Albans about two years ago, is of use in grouping in stands of miscellaneous plants in entrance-halls and rooms, the magenta-coloured foliage having a pretty appearance. Propagation is by means of cuttings taken at this season, and treated in much the same manner as *Colens*.

**PHYLLANTHUS NIVOSUS.**—This plant is not so much cultivated as it deserves to be, the silvery foliage having a telling effect in decorative work. Old plants which may have been pruned and started, and have made shoots a few inches long, may have some of these removed to make cuttings, which, if struck at this season, will make well-developed plants by the late summer and autumn. To grow this plant well, it should be placed at the warmest part of the stove, and receive no overhead syringing, and when grown of the required size removed to the intermediate-house, so as to become somewhat inured to still cooler conditions.

**PROPAGATION.**—*Bartolonias* will now have made nice shoots fit for cuttings, which may be struck in a close case in the stove, or under bell-glasses. *Sphenogyne latifolia* is a rather difficult plant to propagate from cuttings, but the old plants invariably losing their leaves during the winter, it becomes very necessary to raise young stock in the spring; and if the tops of the old plants are taken off early, a quantity of shoots form which make excellent cuttings. These should be taken off with a heel, inserted singly in 2-inch pots filled with leaf-soil and silver-sand, and plunged in bottom-heat; the plants should be repeatedly repotted during the season, but rich composts should be avoided. *Cyanophyllum magnificum* may be struck from eyes taken from the old stems; but where only a small number of plants is wanted, good ones can be obtained if cuttings are taken and treated like *Sphenogyne*. *Nepenthes*: To increase any of this species, take the tops when 5 or 6 inches in length, and not too soft. *Nepenthes* cuttings are very liable to "bleed" when severed from the parent plant, and finely-powdered wood-ashes should be applied to the wound, to stop the flow of sap. Take 3-inch pots, fill them with finely-chopped sphagnum-moss, peat, Cocoa-nut fibre refuse, and silver-sand, one part of each; insert one cutting in each pot, plunge in a bottom-heat of 80° in a close case in the propagating-house, and keep the cuttings well moistened, but guard against damp by raising the lights for a short time daily, so as to air the case. Straggling plants may be cut back at this season to last year's wood; they will take a considerable time to break after this kind of treatment. Seedlings of *Gloxinias*, *Begonias*, and other plants that are large enough to be handled should be pricked off singly into thumb-pots, and placed close to the glass.

**CROTONE.**—These plants will now require an abundance of moisture, therefore all paths and stages should be damped three or four times daily, and, as in the case of all warm plant-houses, the last damping should be done as late as nine or ten o'clock, in order to preserve a moist atmosphere during the night. Young plants which have filled their pots with roots should be re-potted into larger ones.

**SOLANUMS AND EPACRIS.**—*Epacris* which have finished blooming, should be cut-back and re-potted, using a compost of hard peat and silver-sand. Pot firmly, and place the plants in a little warmth until

they break afresh. *Erica hyemalis* and *E. gracilis*, if flowering is past, should be similarly treated. Plants of *Solanum capicastrum* may be cut hard back and shaken out of their pots, reducing at the same time the balls sufficiently to allow of their being put in pots of smaller size. Use good loam and leaf-mould, and put them in a warm pit where they may be kept rather close for a time. When the plants are growing nicely, a frame should be got ready, in which to plant them out during the latter part of April. When all danger of frost is past, remove the lights altogether. Treated in this way, well-berried plants may be obtained early in the season.

### THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Clinton, Tring.

**FLOWER-BEDS** should be carefully looked over, and all flower-spikes of Hyacinths that are of sufficient length should be neatly staked and made secure against rough winds. Tiffany or other suitable material should be held in readiness to place over the beds in the event of sharp frosts occurring; grass edgings may be trimmed, and everything in the vicinity of the flower-garden made neat and orderly.

**HERBACEOUS BORDER:** are beginning to look gay, and most of the plants are above ground; therefore, any gaps that may have occurred should be made good without delay. If the borders have not been dug, a dressing of wood-ashes, soot, or guano may now be afforded.

**HARDY FERNERIES AND ROCKERIES** should be cleared of all dead or decaying fronds and leaves. Fill up all vacancies with suitable plants, and restrict all strong-growing subjects to their proper limits, so that they may not kill less vigorous plants. In some instances a top-dressing of soil may be necessary, especially if some of the soil has been washed away by heavy rains.

**BEDDING PLANTS.**—The propagation of these and the potting-on of cuttings or seedlings must still receive attention. Do not allow greenly to become numerous, but lightly fumigate as often as necessary. All bedding plants in frames should be fully exposed on favourable occasions, so as to prepare them for less sheltered positions, in the event of the frames being required for less hardy plants.

**SEEDS** of Asters, Stocks, Zinnias, Scabious, Annual Chrysanthemums, Everlastings, Ornamental Grasses, Godetias, Marigolds, Nasturtiums, Aquilegias, Foxgloves, Balsams, Carnations, &c., should now be sown in cold frames, lightly covering the seeds with fine soil. Keep the frames close until the seedlings appear, shading only from bright sun.

**TUBERS OF DAHLIAS** that were not required for producing cuttings, may now be put into pots or boxes and placed in cool frames. These plants usually produce blooms much earlier than those raised from cuttings during late winter or early spring, but the blooms are not so fine. Cuttings of Dahlias that are rooted should be kept growing by potting them on as soon as the pots are filled with roots, gradually hardening them off in cold frames before planting them in their permanent quarters out-of-doors.

**MISCELLANEOUS REMARKS.**—Gravel walks and drives should be regularly rolled, and all weeds destroyed as soon as they appear. Grass walks and lawns should also be swept, rolled, and mown as occasion requires. Complete the pruning of Laurels and similar shrubs as rapidly as possible, and give all trees which have recently been moved a mulching of well-rotted manure. Shady walks in shrubberies should now be gay with a display of spring-flowering plants on either side. Such walks may be made very attractive at this time of the year by the use of Wood Hyacinth, Anemone pulsatilla, Daffodils, Primrose, Polyanthus, Myosotis, Crocuses, and other plants.

**BET SUGAR.**—In Germany there were 790,000 acres cultivated in Beets in the season 1884-85; in 1894-95 there were 1,100,000 in this crop. In the latter season there were 14,526,000 tons of Beets produced, yielding 1,842,000 tons of raw sugar, or 12.2 per cent. The sugar consumption in Germany is but 26 lb. per capita, requiring but 600,000 tons for the domestic use of the empire, necessitating the export of the rest. In France 370 factories worked during the campaign of 1894-95, handling 7,130,736 tons of Beets, obtaining a yield of 710,645 tons of raw sugar, or 666,672 tons of C. P. sugar. The average extraction was 9.34 per cent. C. P. sugar, and the average density of the juice 1.072. D. M.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

## APPOINTMENTS FOR THE MONTH.

## MEETINGS.

- SATURDAY, APRIL 4 { Isle of Wight Horticultural Association meet; Soc. Franc. d'Hor meet.  
 SATURDAY, APRIL 11—Royal Botanic Society meet.  
 THURSDAY, APRIL 16—Linnean Society.  
 SATURDAY, APRIL 25—Royal Botanic Society meet.

## SHOWS.

- SUNDAY, APRIL 5 { Royal Agricultural and Horticultural Society of Ghent.  
 TUESDAY, APRIL 7 { Royal Horticultural Society's Committee's shows.  
 WEDNESDAY, APRIL 8 { Royal Caledonian Horticultural show at Edinburgh (two days).  
 SUNDAY, APRIL 12—Brussels Orchidéenne.  
 TUESDAY, APRIL 14 { Brighton Horticultural Society's Show  
 WEDNESDAY, APRIL 15 { Durham, Northumberland, and Newcastle Botanical and Horticultural Society's show (two days).  
 TUESDAY, APRIL 21 { Royal Horticultural Society's Committee's show (Auriculas and Primulas).  
 WEDNESDAY, APRIL 22—Ancient Society of York Florists.  
 SATURDAY, APRIL 25 { National Auricula (Northern Section) Society's Show at Manchester.

## SALES FOR THE ENSUING WEEK.

- WEDNESDAY, APRIL 8 { Begonias, Tuberoses, Azaleas, Palms, Lilies, Roses, &c., at Protheroe & Morris' Rooms.  
 FRIDAY, APRIL 10 { Hardy Perennials, Roses, Carnations, Climbers, Pansies, &c., at Protheroe & Morris' Rooms.  
 Imported and Established Orchids from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—45.8°.

Most gardeners know the value of manurial top-dressings for growing crops, and they apply them pretty generally, but there is less done in the matter of top-dressing the land before it is sown or planted. The reason for abstaining from the practice at that season may be due to a belief that the dressings chiefly used on the growing plant are more likely to do harm than good to the newly-germinated seedling—a belief that is not without its substratum of fact. As for instance, gas-lime in a fresh state, nitrate of soda, Peruvian guano, and even dry earth-closet manure, when highly concentrated, will undoubtedly injure the young plants if brought into contact with them in excessively heavy dressings. But these same substances, together with fowl's and pigeon's dung, soot, woodashes, charred earth, the refuse potting soils from the sheds, and superphosphate of lime in finely comminuted particles, if employed with a light hand, and strowed along seed-drills, or broadcasted, greatly assist the progress of the seedling plants, besides keeping at a distance some of the insect enemies of the various crops. In this last-named important matter, it is a question if we take

enough precautions to safeguard the plants. How many gardeners employ turpentine or petroleum to coat the seeds of Peas, Beans, Turnips, and the Cabbage family, Onions, &c., as a preventative of loss by insects? We opine there are but few who do so.

If a top-dressing consists largely of earth, charred, or simply finely sifted, provided it is known to be free from seeds of weeds, it may be used to coat the surface of the staple to a depth of 1 inch, or to half or quite fill the drills after the seeds are placed therein. The other constituents of the dressing may consist of guano, fowl's or pigeon's dung which has been dried and somewhat fermented; or manure derived from the dry-earth closets, these forming not more than from one-sixth to one-tenth of the whole according to their strength and age. Used in this proportion, none of the manurial aids to growth mentioned can do anything but good, and may therefore be used on any kind of soil not already made rich by manures dug into it over a long series of years. The dressings which such soils as these call for are quick-lime and potash, to supply the probable deficiencies in these substances; gas-lime and soot as remedies against club in Brassicas and the Onion-fly; salt for such crops as Asparagus, Seakale, Celery, Carnations, and Strawberries; all of which, with the exception of salt, should be dug into the soil early in the winter; that is, some months before any crop will be sown or planted thereon. Common salt, muriate of potash, or, as it is now called, sodium chloride, is of much value as an insecticide, besides supplying the plants named with a desirable stimulant, and as a retainer of moisture in soils otherwise dry—one reason why its large use on heavy land is not so desirable. The best time to employ salt is during the earlier part of the season of growth in the plants, for if used after the chief efforts of the plants have been put forth in high summer, growth is unduly prolonged, and the ripening of all parts of the plant delayed till too late in the autumn.

To render a salt-dressing safe when applied to growing plants, it should be intimately mixed with an equal bulk of finely-sifted loamy soil or charcoal-powder, and the quantity of this mixture may not exceed  $\frac{1}{2}$  lb. per square yard; such dressing being afforded at intervals of three or four weeks, and by preference in showery weather, or be followed with a watering with the pot or hose. Salt as a winter-dressing may be applied unmixed with other substances, and at the rate of 3 oz. per square yard, or about 4 cwt. per acre.

The dressing which may be applied to the land when sown or planted, is not necessarily as efficacious when used on the surface during the season of growth, if it contain much earth; quicker effects being obtained when the actual manure is scattered without any admixture, at the rate of 2 oz. to 3 oz. per square yard; closet-manure being an exception, owing to a necessarily large admixture of loamy soil, and 6 or 8 oz. is not too much to be used at one application.

ROYAL BOTANIC GARDENS, GLASNEVIN, DUBLIN (See Supplementary Illustration).—Our illustration is from a photograph taken by Miss ARMSTRONG, and it represents the fringe of the rock-garden, with a shady little rest-house or shelter, from which some pretty peeps and views are obtained. Glasnevin is generally conceded to be one of the most picturesquely beautiful of all the botanical gardens of northern climes. The grounds are very agreeably diversified by Nature, and the genial climate has also been a factor in enhancing its

charms. Glasnevin is beautiful at all times and seasons, and has been much extended and improved during the past sixteen or seventeen years, though it has long been a garden of the richest in exotic plants of all kinds. The place, apart from its acknowledged botanical richness and beauty of contour, is also fraught with many pleasant memories of the past. Close by is Delville, an old domain, the former residence of Dr. DELANY, a Fellow of Trinity College, and afterwards Dean of Down. It is a quaint old-world place, sheltered by great evergreen Oaks, and the grounds are just now blue with the exquisite Apennine Anemone. Even in the latest guide or *Dictionary of Dublin* we find Glasnevin truthfully described as "a quiet little village, prettily situated on the banks of the river Tarka, about two miles from Dublin. It consists of a single street, with some picturesque old houses. In the eighteenth century it was a favourite suburb, and TICKELL, ADDISON, SWIFT, DELANY, SHERIDAN, STEELE, and PARNELL (the poet), are but some of the names intimately connected with its history." SWIFT was a constant visitor at Delville, and it is supposed that whilst there in 1735, he printed some of his squibs and satires, the ordinary printers and publishers being afraid of punishment in such sensitive and troublous political times. Be this as it may, an old hand-printing-press was discovered in an old loft there early in the present century. It is an agreeable experience to visitors to see Glasnevin and its garden for the first time, with the little river Tarka flowing all along its lower side, fringed with beautiful old Willows of several kinds, and there are some pretty peeps from the new arboretum, which was added to, and planted by Mr. F. W. Moore a few years ago. An old lock-up or reserve-garden here is full of rare and interesting things. *Megacarpus gigantea*, *Dicentra chrysantha*, are two plants I never yet saw elsewhere! The rock-garden and hogbed are also full of beautiful things—here, in a dry chink or cleft, a silvery *Celmisia* from Mount Cook, there the Indian *Edelweiss*, or some choice Himalayan Primrose, a giant *Rhubarb* from N. China or Tibet, the dainty *Shortia galacifolia* (sacred to the memory of MICHAUX) and its allies, *Galax aphylla*, or the still more rare *Schizocodon* of Japan. Near the rockery is a quaint Yew-tree avenue known as "Addison's Walk," and doubtless of greater antiquity than the botanical garden itself, having formed a portion of the old demesne that preceded its establishment by the Dublin Society in the later part of the last century. A very handsome addition has been made to the rock garden, especially for hardy Ferns, and a very choice and extensive collection is now most happy and luxuriant in its new home. In a word, Glasnevin is an honour to Ireland as a focus of good plant culture and accurate botanical observation and cultural experiment, and a credit to its Curator, Mr. F. W. MOORE. I am not alone in my expression of this opinion, which is echoed by thousands who visit the garden every month of the year. *F. W. Burbidge.*

ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral Meeting of the Royal Horticultural Society will be held on Tuesday, April 7, in the Drill Hall, James Street, Westminster, S.W., from 1 to 5 P.M. At 3 o'clock, a lecture on "The Movements of Lants" will be given by the Rev. GEO. HENSLAW, M.A.

LINNEAN SOCIETY.—The next meeting of the society will be held on Thursday, April 2, at 8 P.M., when the following paper will be read:—Mr. C. H. WRIGHT, "Monograph of the Genus *Stemona*, Lour." (Communicated by Mr. W. T. THIBELTON DYER, C.M.G., F.R.S., F.L.S.); and Dr. F. ARNOLD will exhibit photographs of types of certain Lichens; and Mr. M. F. WOODWARD, a young *Echidna* from Western Australia.

NATIONAL ROSE SOCIETY.—A meeting of the General Purposes Committee will be held at the Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 7th inst., at 2 P.M., and at 3 P.M. that of the Committee. At the former the Supplement of the Society's Official Catalogue will be discussed, and

A SHADY RETREAT IN THE BOTANIC GARDENS, GLASNEVIN, DUBLIN.

at the latter the Reading and Ulverston Schedules, the report of the referees on the essays on the "Hybridisation of Roses," and other business. H. HONEYWOOD D'OMBRAIN, and EDWARD MAWLEY, Hon. Secretaries.

**M G SCHNEIDER.**—We have to congratulate Mr. SCHNEIDER on his nomination by the French Government as Chevalier of the order of the "Médaille Agricole." Mr. SCHNEIDER is the President of the Société Française d'Horticulture de Londres, and is the author of a valuable work on Ferns, and a trusted employé of Messrs. VEITCH & SON.

**THE ROYAL GARDENERS' ORPHAN FUND.**—The executive committee met at the Horticultural Club on the 27th ult., Mr. W. MARSHALL presiding. The guardians of several of the recently-elected children were appointed, in every case it being the mother. The chairman made formal announcements of the fact that his Grace the Duke of BEDFORD had been approached with a view of his becoming the President of the Fund in the place of the late Sir JULIAN GOLDSMID, Bart., and that his Grace had been pleased to accept the presidency, and would preside at the annual dinner at the Hôtel Métropole on June 18. Authority was given to the Treasurer to pay the quarter's allowances to sixty-eight children now enjoying the benefit of the Fund, amounting to £221. A donation of £5 from Mr. THEODORE COOKSON, Warminster, was announced. Some other matters of business were transacted, and the proceedings closed with a vote of thanks to the Chairman.

**THE NATIONAL DAHLIA SOCIETY.**—The annual general meeting took place at the Horticultural Club, on the 27th ult., Mr. G. GORDON, one of the Vice-Presidents, presiding. There was a good attendance of exhibitors, and of other persons interested in the cultivation of the Dahlia. The annual report, read by Mr. T. W. GIRDLESTONE, the Hon. Secretary, stated that while in 1894 the Dahlia plants were backward owing to the sunless character of the summer, the prolonged heat and drought experienced in 1895, seemed in many districts to delay the starting of the plants into growth, and it was undoubtedly the case that many varieties were not fully in bloom, by the date of the Society's exhibition at the Crystal Palace, on September 6 and 7. Nevertheless, the quality of the show, as a whole, and of fancy blooms in particular, was of a high order, although not a few of them showed evidence of the effects of heat and lack of moisture; but the collections of Cactus Dahlias were magnificent, and the fine display made by these and the single varieties was unquestionably the feature of the exhibition. A considerable number of Certificates of Merit were awarded to new Dahlias, the majority of the varieties certificated being of the best Cactus type. The committee still have to regret the membership of the society does not increase to the desired extent, and they would gladly welcome a further increase, especially from the northern growers, who are not strongly represented. The report concluded by thanking the donors of special prizes, and announcing that the next exhibition will take place at the Crystal Palace on September 4 and 5. The financial statement submitted by the treasurer, Mr. E. MAWLEY, showed that, with a small balance in hand, the income of the society had amounted to £134 2s. 6d. Subscriptions came to £53 7s., donations to £22 3s., contribution by the authorities of the Crystal Palace £50, and advertisements in the schedule of prizes £8 4s. On the other side, prizes had been paid amounting to a sum of £116 7s., and with printing, office expenses, &c., added, there was yet a balance in hand of £1 13s. 5d. In moving the adoption of the report, the chairman called attention to the very small cost at which the society is worked, and hinted, as a means of bringing in more supporters, whether more meetings of the members could not be arranged; throwing out other suggestions of a practical character. Several members also suggested measures which it was thought would lead to a greater and more widespread interest being taken in the Society's work;

eventually, the motion for the adoption of the report was carried. The Rev. CHARLES FELLOWES was re-elected President; the Vice-Presidents were also elected. The names of Messrs. W. MIST, F. FELL, and A. TAYLOR were added to the committee; Mr. E. MAWLEY was re-elected Hon. Treasurer, and Mr. T. W. GIRDLESTONE as Hon. Secretary. The list of true Cactus Dahlias was revised, all those awarded Certificates of Merit at the Crystal Palace in 1895 being added. A suggestion that a list of Certificated flowers of the previous year's exhibition should be given in the annual report, with the analysis of the varieties exhibited, was accepted. The proceedings, which were of a cordial and business-like character, closed with a hearty vote of thanks to the Chairman.

**DIRECTORSHIP OF THE SANTIAGO BOTANIC GARDEN.**—We are informed by Mr. T. GREENES that he has been appointed to the directorship of the Botanic Garden at Santiago, Chili, he having entered on his duties at the beginning of the present year, and he requests that all communications for that Institute be addressed to him direct.

**CHESHUNT, WORMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.**—The usual fortnightly meeting was held on Thursday, March 26, in St. Mary's Hall, Cheshunt, the number of members present being 175. NIEL MACKENZIE, Esq., presided. Mr. J. HUDSON, gardener at Gunnersbury House, gave an instructive lecture on "Stove and Greenhouse and Warmhouse Climbing Plants." A discussion ensued at the conclusion of the lecture. Mr. HUDSON having replied to various questions put to him, a hearty vote of thanks was accorded him on the motion of Mr. GEORGE PAUL, and seconded by Mr. W. GREENLEAF.

**THE PAST WINTER IN THE RIVIERA.**—A correspondent writing from the Riviera remarks of the past winter that it has been one of the most genial experienced for twenty years; there having been very few frosts, and none since the beginning of January, and no snow. No rain has fallen for four months, which makes gardening operations very difficult; nevertheless, the gardens are resplendent with flowers. For the last six weeks the air has resounded with the notes of the blackbird and the hum of the bees, which latter have been busy the whole winter through. In consequence of the check vegetation received last winter it is very little in advance of last season, but a good shower of rain would work wonders.

**PROPAGATION BY LEAVES.**—It may not be generally known that the Cape species of *Ornithogalum* may be increased by cutting off the leaves at the ground-level, and inserting them similarly to *Gloxinia* leaves. There is no necessity to use special preparations, but they may be stuck in at the edge of the pot in which the plant is growing. Young bulbs and radical fibres are found adhering to the leaf. They appear to be formed by the return of the sap which had nourished the leaf. Experience has proved that the leaves should be taken off while the plant is advancing in growth. Leaves may also be made to produce bulbs in *Hyacinthus corymbosus*, *Eucomis*, and some species of *Lilium*. *Extract from a note by W. Herbert, in "Gardeners' Chronicle," June 12, 1841.*

**THE ORIGIN OF HONEY-DEW.**—M. GASTON BONNIER recently laid before the Société de Biologie an interesting paper on "Honey-dew as exuded from Leaves, compared with that the Result of the Puncture of Aphid." From the *Comptes Rendus* the following particulars are taken:—

1. Although aphid and scale are the most frequent cause of honey-dew, honey-dews are found which have an exclusively vegetable origin.
2. The production of honey-dew by aphides may be maintained during the whole of the day and diminished during the night. Honey-dew which is a direct exudation from the leaves is, on the contrary, formed at night, and usually ceases during the day; its greatest abundance being at day-break.
3. The conditions which favour the appearance of

vegetable honey-dew are cool nights and hot dry days. Increase of moisture and darkness favour the production of honey-dew, if all other conditions are equal.

4. The exudation of sugary liquid from the stomata of the leaf can be artificially effected by plunging the branches and leaves into water and placing them in darkness in a saturated atmosphere. Under these conditions the leaves produce honey-dew, while leaves left on the tree do not form any.

5. While bees will collect any sugary substance, no matter what, if there is nothing else handy for them, yet they always prefer, when they have any choice, the richest source of supply. When honey-yielding plants are flowering freely, they desert the honey-dew, especially that formed by the aphides; they will take it, on the contrary, on days when there is a scarcity of honey-giving flowers.

6. The chemical composition of honey-dews is very variable. That of the honey-dews of vegetable origin approaches more nearly to the chemical composition of nectars than does that of the honey-dews produced by the aphides.

**NOVELTY IN CHERRIES.**—Those who will enjoy fruit fresh from the tree in the month of October, should plant the new Cherry, *Hochgenuss von Erfurt*, which, freely translated, is "Erfurt Delicious." It is quite a surprise when no Cherries are to be found in garden or market to see a Cherry-tree well loaded with fruit; and every one, says a writer in the *Oesterreichisch-Ungarische Gärtner Zeitung* of March 15, if he have a suitable spot in his garden, should plant a tree or bush of this variety. It is an excellent market gardeners' Cherry, as it is only the earliest and latest fruiting varieties which have the most high market value. The tree is a vigorous grower, with a round crown; and the foliage is large and dark green in colour; the fruit is rather large, of a shining light red colour. A peculiarity of the variety is, that ripe, half-ripe, and quite green fruits are found on the tree at one and the same time, so that ripe fruits can be gathered for a period of five to six weeks.

**PRICE OF FLORIST'S FLOWERS IN SAN FRANCISCO, CALIFORNIA.**—On February 8, I had occasion, writes a correspondent, to visit a number of florist's establishments in San Francisco, and took the opportunity to enquire the prices of cut flowers on sale for decorative and funeral purposes. The prices asked for cut flowers in this land of flowers astounded me. Double Violets in bunches, 4 inches across, were selling for 25 cents (1s.); Carnations, both cardinal and pure white, 75 cents (3s.) per dozen flowers; *Narcissus pseudo-Narcissus*, N. *Tazetta*, and N. *Tazetta aureus*, 75 cents per dozen stalks; N. *Tazetta papyraceus* was more abundant, and figured as low as 25 cents per dozen stalks. *Lilium candidum* is much used for decorations, and I was surprised to find that one could not get a dozen stalks, even with only one or two open flowers on each, for less than 5 dols. (£1). At the corner of Kearney and Market Streets, which is a rendezvous for Italian street flower-sellers, one could get pretty good *Narcissus pseudo-Narcissus* (single) for 25 cents per bunch of twelve, and Violets for 15 cents per bunch.

**MR. JOHN PAGE**, upon leaving the employ, recently, of the Marquis of LOTHIAN, K.T., whose gardener he has been during the last twenty-seven years, has been presented with many souvenirs by his fellow-servants and others who have known and respected him during many years.

**VINEGAR FROM HONEY.**—*The Production of Vinegar from Honey* is the title of a small pamphlet by the Rev. GERARD W. BAXTERS, who warmly recommends honey-vinegar in preference to malt-vinegar. The author claims for the former a delicious flavour and aroma, greater wholesomeness, and economy. Honey-vinegar can be made at home, so that its purity can be ensured. It affords a means of using up honey which is unsaleable, owing to discoloration or fermentation, and, if made in wholesale

quantities, would increase the bee-keeping industry. We advise housewives who are fond of making home-made preserves to try concocting vinegar from honey according to Mr. BANCKS' recipes. They can, if they please, add to it Celery, Clove, Raspberry, or any preferred flavouring.

**ROYAL BOTANIC SOCIETY OF LONDON.**—The following is the programme of the Daffodil Conference to be held April 14, under the auspices of the Royal Botanic Society of London, in the lecture-room and museum of the society. Mr. J. G. BAKER, F.R.S., F.L.S., of the Herbarium, Kew, will preside, and the chair will be taken at twelve noon. The following papers will be read:—Mr. F. W. BURBIDGE, M.A., F.L.S., F.R.H.S., opening address, on the "Past, Present, and Future of the Narcissi."

	The Cultivation of Narcissi by an Amateur.
Rev. E. S. BOURNE	1. Soil and situation. 2. Time of planting. 3. Supply of nourishment. 4. Time of lifting. 5. Some good varieties. 6. Culture in cold frames.
Mr. W. ROBINSON	The Hardy Narcissi, and their Artistic Use for Planting in Grass, &c. The Daffodil as an Exhibition and Decorative Flower.
Mr. J. D. PEARSON	Notes on Method of Treatment of Exhibition Biomes, Cutting, Packing, and Arranging. Suitable Vases, House Decoration. The pleasures and pains of Colour to an aesthetic mind.
Mr. C. W. COWAN	A few Notes on the Successes and Failures of Growing Daffodils in Midlothian.
Dr. CRAWFORD	Basal Rot, and the Conditions necessary for Healthy Culture of the Daffodil.
Mr. C. STUART	Description of the miniature Whitehall group of Daffodils and their origin. Remarks as to parents of the varieties, and how the crosses were effected which produced them. The opinions of eminent authorities on this group. Detailed description of a few of the more remarkable varieties; with flowers to illustrate, or paintings if the flowers are over.
Mr. J. ALLEN	Daffodil Hunting in the Pyrenees.
Mr. M. J. CAPARN	The Daffodil in Art.
Miss MARIE LOWE	The Daffodil in Decoration, Illustrated by Flowers and Paintings.

A show of Daffodils and other spring flowers will be held in the gardens on the same day.

**MR. J. R. JACOB.**—Some few years ago, Mr. J. R. JACOB, of Newport, Mon., Seed Merchant, compounded with his creditors for 7s. 6d. in the £. On the 7th ult., he invited his creditors to a dinner, at which he distributed cheques in payment of 12s. 6d. in the £ to complete 20s., remitting to those who could not attend. Such honourable conduct was considered deserving of some mark of appreciation, and on the 25th ult., Mr. JACOB was invited to a complimentary banquet, at which he was presented with a Silver Tea and Coffee Service, and an illuminated address on vellum.

**DIAMONDS AND PASTE.**—The newly-discovered Rontgen rays have been utilized in distinguishing real from imitation diamonds.

**PUBLICATIONS RECEIVED.**—*Leamington St. Mary's Cottagers' and General Horticultural and Industrial Society's Rules and Schedules for 1896.*

## STRAWBERRY FORCING.

WHATEVER fate may be in store for the new French Perpetual Strawberries, such as Louis Gauthier, so picturesquely introduced to English growers through representations of the parent plant, with its first and earliest-rooted runner still attached to it, this interesting object-lesson has suggested some considerations which may conveniently find expression under the heading of the waste of force. In the French woodcut we have an old Strawberry-plant of extraordinary fruitfulness, which is said to fruit in May and June, and one early runner still attached, though rooted to fruit through August and September. Now, it may be said, truly enough, that there is nothing specially novel in this. Any notable early Strawberry—say, for example, the Black Prince—

would do likewise if permitted, and strong parent plants would help support these later ones to fruit in the autumn, if desired. Just so; and this has often been done, but with variations which may make wide differences in the results. For example, the French woodcut only shows one runner to a plant, thus securing great concentration of force, which is one of the chief factors of success in this mode of culture. The French also seem to retain the connection between the parent plant and the runner throughout the season, which may pour additional vigour into the young plants for autumn fruiting. This is the more probable, as, from the enormous fruit crops on the parent plants in the early summer, the French growers seem to rely wholly on the young runners for the late crops rather than on a second crop from the old plants; hence the greater certainty of double supplies of food for the young plants through the retention of the runners until the end of the year.

Those familiar with the practice of rooting from one to three early runners from early-forced Strawberries, as a sure means of providing early runners for next year, or of supplementing a good second crop from the old plants in the autumn, also often left the lines of the runners intact until the end of the season, and no doubt such prudent diversions of vital forces not seldom prevented their loss, or converted them into profitable produce in the least space of time.

But apart from any such disputable ground there can be no doubt that English growers sacrifice an enormous amount of productive capacity annually by consigning their early-forced Strawberry plants to the rubbish-heap as soon as they have ripened their first crop of fruit. It is not too much to affirm that thousands and tens of thousands of fine plants are thus sacrificed every year. The practice of throwing away forced plants brimful of youth and vitality, had its origin in mistaken notions. It was long held that all forcing was necessarily a depleting and exhausting process, so much so, that by the time the first crops were gathered the plants were so weak as only to be fit for the rubbish-heap.

Why, what evil have they done? Most of the plants have yielded good crops of Strawberries; and in the doing of the latter, they have enlarged their size, and increased their capacity for future service. And all this as a sort of side product the plants were obliged to yield while ripening under the most favourable cultural and physical conditions their first crops of fruit.

Under such fostering, is it any marvel that the plants are found better, stronger at the close of their first campaign than at the start? They are mere babies as yet, seldom exceeding from six to nine months old. They have been liberally fed on the best soils and manures, fostered with moisture, strengthened with light and air, kept scrupulously clean. Under such favourable conditions, it was impossible for the plants to ripen the current crops and strong for the next, and this through the multiplication of crowns and the formation and maturity of early runners. For which of these distinguished services are our forced Strawberries consigned to the rubbish-heap? Let me say here that all the weaklings, the failures, and the over-strong barren plants should be destroyed at once. But surely such plants as I have described deserve a second or even a third trial.

The chief difficulty is safe storage for a time when removed from forcing-houses or shelves. Out of the heat, say of 65° or 70°, into the frost or the March winds, there would be a speedy arrestment of the fruitfulness of such plants. But where cold pits, the floors of orchards or Peach-houses abound, from which frosts and biting winds can be shut out, there need be no chilling check or any difficulty. The forced Strawberries need to rest awhile in safety, and the more profound the rest, the more prolific the blossom and prodigal the fruit in the autumn.

All Strawberries will not be equally successful in yielding a second crop of fruit within a year or fifteen

months of their runnerhood. But most of our early and mid-season varieties will do so readily under this simple and easy mode that I am now describing for the husbanding and utilising of the vital force that enables Strawberries to fruit twice within little more than a year.

Early in May, or so soon as all danger from injury by frost is over, the Strawberries should be planted out, say 2 ft. or 30 in., by 18 in. or 2 ft. apart. The soil should be good, the site warm, the plants watered home should the weather prove dry, and mulching for the protection of the fruit and the conserving of the moisture in the soil duly attended to. In some gardens a partially-shaded border or plot proves best, as autumnal sunshine is more scorching than that of summer. To succeed with this autumnal crop of Strawberries the plants must never be allowed to flag from the start to the finish. My largest experience has been with Black Prince, Kew's Seedling, Eleanor, Alice Maud, British Queen, President, Paxton, and Vicomtesse Hélicart de Thury. But we have now more modern varieties, probably better for this mode of culture, and the art lies more in the culture than in the constitutions of the plants. But what of the plants after their second crop in the autumn? Only this, that they are still more full of productive force than ever; and the finest crops in quality, and the heaviest in bulk, ever gathered by the writer have been from plants forced in the spring, fruited in the open in the autumn, and fruited once more in the usual way the following summer. And what next? why trenched in, but still in such strength and vigour as to afford by their decomposition a good manurial dressing to the land.

Before advocating for general practice maiden Strawberry plants for profit, I would strongly advise the adoption of this simple means of utilising the vital and fruiting forces so often allowed to run to waste in our forced plants. D. T. E.

## PLANT NOTES.

### DOUBLE-HYBRID POTENTILLAS.

POTENTILLAS generally are free-flowering, producing masses of bright-coloured blooms for many weeks in succession; the plants, moreover, are vigorous, thriving in any kind of soil, and almost any situation, for which reason they are better adapted for what is known as wild or wilderness gardening than most herbaceous plants. They flourish on artificial rock-work, outdoing in such positions, when the soil is deep and cool, rock-Roses in the matter of display. The advantage possessed by the latter where grouping is concerned is seen in the fact that rock-Roses have more light-coloured or white flowers, which certainly afford a better effect at a distance. The great improvement made in Potentillas, especially in the double-flowered crosses, is lacking in that one particular of white flowers; although yellow, rich orange, crimson, marea (some spotted, striped, or margined in various colours), exist amongst the newer forms, white is absent. Hence, however beautiful they are, it is desirable, when planting for contrast of colours, to add here and there a plant of the old single white and yellow *P. caulescens*, and the white-flowered *P. rupestris* and *P. speciosa*. Though I refer more particularly to a selection of double-hybrid varieties, it may be remarked that, including the double forms of *P. argrophylla*, two dozen and more good and showy varieties exist, from amongst which I make the following selection:—Wm. Rollinson, an old, but fine variety, of a mahogany-brown and orange colour; Alfred Salter, scarlet and orange; Vervaeana, reddish-yellow; Etna, scarlet; Louis Van Houtte, deep crimson; Chinios, yellow; and Haulet, very double, dark crimson. Planted in deep well-enriched soil, Potentillas grow with vigour, and being able to contend against aridity, the plants bloom throughout the best months of the summer; it is, therefore, important to secure the stems betimes in the spring and early summer, to have sufficiently strong stock. *William Earle*.

# A SUPPLEMENTARY LIST OF HYBRID ORCHIDS,

Continued from vol. xviii., third series, page 10; made up to March 14, 1896.

## HARDY FERNS.

To the student of our native Ferns, their various individualities, not merely of perfected form, but of the previous stages of development, present many interesting features, since although one and all of them go through that curious process of unrolling of their parts, which is one of the chief characteristics of the Fern family, yet each species does this in its own peculiar fashion. Later in the season, when the young fronds are rising amid a feathery host of unfolded ones, these peculiarities are less noticeable than when the first awakening breath of spring stimulates to growth the dormant crowns, and the firstlings of the season rise up in isolated prettiness to start the summer campaign.

From the crowns of the Lady Ferns, hitherto mere unsightly brown clumps, spring dozens of slender stalks, bearing their future fronds in tightly-picked balls at their tips, or it may be shaken out loosely, crozier-fashion, in their next stage of development. The Broad Buckler Fern, with darker green and bolder growth, is distinguished also by its almost black scales enveloping somewhat flattened balls from which the wide basal pinnae speedily assert themselves and show the species. The male Ferns are shooting up their tawny fronds, thickly clothed with dark-brown, somewhat fluffy-looking scales, and do not form a ball at all, the long, pendulous, crozier-shape appearing at once with only the extreme tip of the incipient frond remaining rolled up to match the symmetrical double row of incurved pinnae. The Shield Ferns, besides retaining a large share of their still green fronds, assert their originality at once by protruding their young fronds thickly decked with almost snowy-white scales, and subsequently develop these in a different fashion to their neighbours, the tips of the fronds falling backwards, and forming reversed croziers of remarkably pretty pendulous habit, the snow-white scales extending even to the tip, and adding much to their distinctive beauty. The Mountain Buckler Fern (*Lastrea montana*) can at once be recognised from its generic brethren by forming bright green balls, from which the tips of the reflexed pinnae protrude like *choucroute de frise*—a bunch of hooked points. *L. Thelypteris* (the Marsh Buckler Fern) does precisely the same thing; but they are not found together, the one demanding good drainage, and the other, as its name implies, preferring bog. The Hart's tongue, though sluggish in rising, is showing its white woolly crowns crowded with unopened fronds; while the Polypodies will be seen to be actively extending their creeping rhizomes, and sending up their new growths from every node and terminus. At this stage the Oak Fern (*P. dryopteris*) and the Limestone Polypody (*P. calcareum*) can be at once discriminated, by the former hanging out a pawnbroker's sign of three balls prior to forming its delicate triangular fronds, while the latter forms a short crozier instead; in the subsequent further development of the fronds of the various species, it is curious to note what variety is afforded even where the eventual form of frond and habit of growth may be extremely alike.

Leaving, however, this theme, and turning to its practical application, we grasp the fact that the growing season has commenced, and that therefore the time has now arrived to put our collections in order.

Just after the long rest of winter, Ferns—whether deciduous or evergreen—are in their most vigorous condition, and best able to bear the strain of transplanting or division. The new frondage being also in an incipient stage is not so likely to get damaged in these operations as when fully developed; nor is the drain upon the roots so severe as later on, when large areas of leafage demand their full energies for their support. At this time, too, the drying winds of March are over on the one hand, and on the other, the hot days of summer are still in the future, so that the plants after removal or division, have everything in their favour, and in a month's time will become well established, and show no signs of the operations they may have suffered.

Before giving a few hints as to division and

arrangement, we would here enter our annual protest against the almost exclusive use of our common British Ferns, i.e., the normal forms, for furnishing so-called hardy ferneries. In hundreds of these we find not only no varieties at all, but repetitions *ad nauseam* of only some six or seven species out of our native forty odd. The common Male Fern, Lady Fern, Broad Buckler Fern, Hart's-tongue, Polypody, and Shield Ferns covering the whole area, while here and there a specimen, often half-starved by drought, of *Osmunda regalis*, is supposed to give an air of rarity. Now, the whole of these (excepting, perhaps, the last), are as much out of place in a collection proper as our commonest wild-flowers would be in a choice garden; they are, indeed, the weeds and mere raw material from which Nature has fashioned thousands of far more beautiful forms which only figure in collections worthy of the name. At Kew there are many hundreds of these choice types, which have been given and bequeathed to the nation, and we are happy to say, handsomely lodged by the authorities there. A visit thither would afford a liberal education in the capacity of comparatively simple forms of vegetation to evolve others of very different type, some fantastic, some beautiful, but all replete with interest. A large majority of these are in trade hands, and can be obtained at small cost; all, with scarcely an exception, are as hardy and as easy to grow as the "weeds" in question, and yet, *mirabile dictu*, ninety-nine out of a hundred people are either absolutely ignorant of their existence, or so nearly so that due appreciation is out of the question. On the other hand, those few who do take up the study rarely fail to become enthusiastic, especially when they have reached the status of Fern-hunters and Fern-propagators, and have enriched their collection by original "finds" of new types, or improved varieties raised by themselves from spores. One striking fact in this connection is, that while our choicest flowers, fruits, &c., are the outcome of selective culture for many generations, slight grades of improvement being noted and accumulated time after time, nearly all our most striking Fern varieties have been found fully developed growing wild among the common ones whence they sprang. Many forms, it is true, have been improved by selective culture from these "finds," but the actual types, almost without exception, are Nature's unaided products.

As regards division of established plants, those of robust growth, such as the Lady Ferns, various species of *Lastrea* and the Shield Ferns, the individual crowns of which send up their fronds more or less *a la* shuttlecock, most of them in course of time form dense clumps, either by means of offsets at the side, or by a process of fission in the crowns themselves. These crowns can be divided, when old and well-developed, by lifting the plants and gently forcing or tearing them apart with the fingers, the independent bunch of roots attached to each then coming away intact; but with recently-formed crowns it may be necessary to sever the point of junction with a sharp knife, which should only be inserted just far enough for the operation to be completed as above, otherwise many of the interlacing roots will be severed at the expense of the vitality of the plant. Small bulbil offsets appear often in abundance at the bases of the old fronds, and it is best, if possible, to detach these bases with them by forcing them off with a blunt bone instrument. Bulbils on the fronds of Shield Ferns are best treated by severing the entire frond, pegging it down on open soil, keeping them close until established, and dividing them later on when rooted. Ferns, such as the Polypodies, Bladder Ferns, and others, which have creeping rhizomes from which the fronds rise singly, are easily managed; it is only necessary to sever the rhizome into portions bearing each a frond or two and a growing tip—these pegged down on to congenial soil speedily root and establish themselves. Hart's-tongues admit of easy division when more than one centre of growth has formed, a sharp knife being used to sever them. Curiously enough, every base of the old fronds of this species will

yield one or more plant, if cut or pulled off and inserted into soil under glass. It is, however, a month or two before signs of growth appear in the shape of small whitish nodules, generally near the eut edges. Spores sown now will yield nice little plants by the autumn, and will be much forwarded by a little extra warmth until the young plants appear. They should be sown on little nodules of clay or loam, inserted in open compost, the whole being sterilised by a copious drenching of boiling water prior to the sowing, otherwise worms and fungi will upset the crop. The pots or pans must be covered with glass, and kept in a moist place, as they should not require any watering when once sown. If they do, they must be watered from below by immersion, and not from above, as the least disturbance is fatal, and the water itself is apt to convey inimical germs of mosses, &c., which are likely to gain the upper hand. As most of the varieties show to much better advantage when grown as single crowns, we strongly advise division whenever possible. Those which begin by forming bulbil offsets on the side are easily kept to single crowns by removing these as they appear, the result being great additional vigour in the old crown, since it has only itself to support, and the youngsters do not compete with it when established. In time a sort of trunk is often formed, and then the tendency towards offsets decreases, and often disappears entirely. Those which multiply by fission are more difficult to deal with, as it may be a season or two before the crowns are sufficiently individualised to be parted. The small Ferns of caespitose or bunched habit of growth should be left alone to form good specimens, constant division simply spoils them, and their fronds in any case have plenty of room to display themselves. *Chas. T. Drury, F.L.S., F.R.H.S.*

## METHODS OF PROPAGATION.

(Continued from p. 393.)

Do not try to graft Roses on Black Currant stocks to get black Roses, a feat successfully performed by a blacksmith in the Weald of Kent—so they say! Many a time have I determined to go and see this wonderful Rose, but like poor Alphonse Karr, put it off till too late. This is the story as he tells it:—"I was told that the *Fraxinella* (*Dic-tamnus*) when in flower exhales so much essential oil as fragrance at night, that if a lighted candle were approached, the impregnated air would flash up like escaped gas. The *Fraxinella* was not then in flower, but I determined to try the experiment next season. Alas! each year something prevented my doing so, and now I have no garden, and no *Fraxinella* to experiment upon, so fear I shall die without clearing up this important fact."

Returning to the practical, let us learn the methods of Coniferous grafting, but remembering that, however successful this operation may be, grafted plants are never so satisfactory as seedlings, because they rarely make a perfect "leader" or central growing shoot, and symmetry is sacrificed; this is most marked in the Pines and Firs. *Thuias*, *Biotas*, *Junipers*, *Cypresses*, *Retinosporas*, with a few other allied species, may be usefully increased by grafting. The stock for the first two is the American *Arbor-vite* (*Thuia occidentalis*). I have found Lobb's variety answer well (*T. gigantea*). For the next two use the Red Cedar (*Juniperus virginica*); and for the Cypress family take *Cupressus sempervirens*, the funeral upright Cypress, all of which may be bought in nurseries at very reasonable prices as two or three-year seedlings. They should be potted for use as stocks, avoiding corkscrewing the roots, or allowing them to remain in the pots so long that the roots take that form. For the many fine varieties of Larch, as Kämpfer's golden form, introduced from Japan by Kämpfer as early as the close of the seventeenth century, use the common Larch as foster-parent. The other Larches are perhaps only botanically interesting, while the elegant weeping form of *L. europæa* is best increased by inarching or "approach grafting" in the open air, a process that will be noticed

\* *Le Retour du Jardin*, par Alphonse Karr.

later. The Ginkgo, known also as the Maidenhair tree, from its wedge-shaped, pedulous leaves, resembling those of the Maidenhair Fern, should be grafted on the Larch; as may be, allied species, such as the Dammar Pine, and probably *Taxodium distichum*, the deciduous Cypress, but the Dammar is not hardy, and only fit for the decoration of winter gardens or large conservatories.

For the true Pines, no stock is more handy and suitable than the Scots Pine (*P. sylvestris*). Here, however, a caution is necessary, for if potted into small pots for the purpose of inside grafting, the roots become cramped and assume the corkscrew-form, which, in some cases that I have known, caused severe stunting of the trees after some years of growth. Pot only those seedlings, therefore, as stocks which possess short fibrous roots, and do not twist any of these the more easily to get them into the pot, and in that manner initiate the corkscrew-twist. In March, take some of the established stocks, and having selected scions from the Pines, which should if possible be leaders you wish to increase, cut the stock about half through, and then make a tongue (as it is called) in the wood half-way down the cut. Prepare the base of your scion in the same way, leaving the growing point or bud intact, and then adapt the scion to the stock accurately, so that the cambium layer of each coincides; bind the two together closely with Raffia or worsted, and cover with prepared clay, and place the stocks in the dark under the staging of the pit for a day or two. Take them out after that lapse of time, and smear the union again with clay, plunging them in a close case in the propagating-house for a week or two, in which time a perfect union will have formed. Do not keep the young plants very moist, but occasionally sprinkle them with a fine-rose can. After gradually hardening-off the plants, they may be quartered out in the nursery bed, taking care to heap the soil over the point of union.

This method will serve for all the Pines, but the beginner will find the needle-like leaves interfere with his work. Do not roughly pull these off, but use a sharp pair of Grape-thinning scissors to remove them before using either stock or scion. *Experience.*

## INTERDEPENDENCE OF PLANTS AND ANIMALS.

(Continued from p. 393.)

"IN the savannah rises a great Eta Palma, perhaps 60 feet high, its mass of roots standing above the water as a mound, from whence proceeding the rough but bare stem to a height of 50 feet, where the great dome of fan-shaped leaves crowns its apex. Here are no rivals of its own kind, no bush ropes or smothering creepers, and hardly anything to dispute its claim as monarch of all it surveys. Even here, however, are signs of interdependence. Below the crown stand the remains of a hundred clasping leaf-stalks of different ages, their axils filled with decaying vegetable matter, in which revel the aerial roots of that unique Orchid, *Catasetum longifolium*. With ribbon-like, flexible leaves streaming downwards and great flower-spikes slightly bent outwards to greet the sunlight, this plant also appears to have no rivals; however, we want the Orchids, and must get them, and the only way to do this safely is by cutting down the beautiful Palm. We regret this necessity, and even go so far as to send one of the negroes (a well-known Cocoa-nut gatherer) to bring down a plant; but he gets started at a small gecko lizard, and with a cry of "A wood-slave bite me," comes down with nothing but one of the *Catasetum* bulbs, which he has hurriedly torn off in his fright. The poor little reptile could not injure him in any way; but as our specimens would be useless if torn to pieces, we resolve to cut down the Palm. At first the axe rings on the hard trunk, as if both instead of one were made of steel; but presently, as an entrance is made, the wood proves quite soft. Then the mighty prince of the vegetable kingdom, as Linnaeus would have called it, bends over, and comes crashing down, and throws up sheets of water and mud as it

strikes the surface of the swamp. We wade towards the crown, and begin feeling below for the *Catasetums*, and presently notice that the water is black with ants, which soon make their presence known most unmistakably by their virulent bites. However, we are not to be daunted by these pests, and soon manage to loosen an Orchid, bringing with it a nest of hairy spiders, the dreaded wood-slave, a little harmless snake, quite a number of cockroaches, and two or three beetles. We also discover that several plants have entered into competition with the *Catasetums*, including a small species of *Vanilla*, a few *Ferax*, and one or two *Genereae*.

Like an island in the sea, this Palm-crown stood far away from dry land, till it became a little world in itself, with carnivorous and herbivorous animals, and plants, all living, fighting, and killing each other, but still keeping up the balance of life. Although we are continually speaking of "the struggle for existence" and "survival of the fittest," few, it seems, are able to appreciate what these sentences mean; but to the naturalist in the forest, they are full of suggestions. If it were possible to have absolute peace throughout a world where there was no difficulty, sickness, or death, it could only consist with a dullness of which we can hardly have any conception. From the lowest plant to the highest animal all have to work hard, and get material to build up and keep alive those beautiful structures which we admire so much. Except a very few, all live by the destruction of others, and have to be continually trying to circumvent their neighbours to escape extermination. How exactly they are fitted to contend with adverse circumstances, is shown by the fact that so many survive; and, although in the long ages which have passed since life first originated on the earth, the destruction has undoubtedly been enormous, it must have been always of little importance in comparison with the survivals.

This is beautifully exemplified in a thousand ways. Here in the forest we see evidence of enormous developments having taken place in the past; and, what is of far greater importance, actually in progress before our eyes.

Some objectors to evolution have gone so far as to state that variation is mainly due to man's interference; but when it is considered that cultivation is applied for the purpose of perpetuating certain characters, and developing them at the expense of others, we see at once this cannot be true. Even the original divergencies which he utilises took place entirely apart from his influence, and however he may try to produce certain changes, he can never succeed unless the initiative has already been taken.

The examples we have just given are illustrations of the more active side of the great struggle, but a thousand others might be quoted where plants at first sight appear almost passive. Yet even here a grand work is always in progress, in every case more or less connected with the interdependence between one life and another. Without the tree the epiphyte or parasite could not exist as such, without the flower the bee would be starved, and without the numerous fertilising agents most plants would be unable to produce seeds. In temperate climates the woods are made up of two or three species—sometimes of only one. These blossom almost simultaneously, and their pollen floats upon the wind to long distances. Here in the tropics, however, things are different; the wind has little power over such a mass of foliage. Whether looked upon from above or examined carefully from beneath, the undulating roof seems perfectly still. The branches are rigid, the leaves stiff, and even the flowers thick in texture. There is nothing comparable with the Birch or Beech, much less the trembling Aspen. The changes produced by a sudden gust upon these trees are entirely unknown here, as are also those beautiful effects of light and shade which delight the painter and poet. It follows, also, that such yellow clouds of pollen as hover round the Pines are entirely wanting, there not being, as far as can be seen, a single wind-fertilised tree in the Guiana forest.

Being unable to utilise the air currents, the flowers

have had to look round for efficient substitutes, and these are found in the host of insects which hang in clouds over the forest canopy by night, and buzz around in swarms during the day. Even birds are utilised by some of the larger flowers, the pollen collecting on the bristles at the root of their beaks. Without living helpmates, many a tree would become extinct, therefore every effort is put forth to attract and induce winged creatures to render this assistance. The principal means to this end are colours and perfumes, the former for diurnal and the latter for nocturnal insects. Brilliant colours are of themselves sufficient to attract butterflies and bees; lurid and dull tints are usually accompanied by odours more or less disagreeable to our senses, but pleasant to flies. It might be suggested that in the one case the flowers are gaudy, because they are open to the fierce rays of the tropical sun, while the others are the contrary, on account of their blooming in the shade. But with the apparent capability of choosing between the ends of the branches, the axils of the leaves, and the trunk, all attain their object, whichever place they have selected. Here and there in the forest, we come upon a tree, the flower-stems of which originate below the canopy of leaves, and this appears so strange that we wonder why such exceptions occur, and what particular advantage is derived from this position. Except that here they are more in the way of the shade-loving insects, we know of no other reason, and must at least accept this provisionally. The Cacao is an interesting example, and it can hardly be considered as having degenerated, but rather as being most beautifully fitted to its environment." *J. Rodway, in 'The Guiana Forest.'*

(To be continued.)

## CULTURAL MEMORANDA.

### RICHARDIAS.

THE fine habit, rich green foliage, and large white or yellow spathes set well up above the foliage, cause these plants to be much employed for decorative purposes in the cool conservatory and the dwelling during the winter and spring, and there is scarcely anything of more use than plants of *R. aethiopicum*, if well grown in 10 and 6-inch pots. They will stand in good condition for several days without injury in a room, and the spathes when removed from the plants and arranged with their own leaves in vases are quite as effective and as lasting. The ease with which *Richardias* can be grown and increased by division, or by seeds, is another reason of their advance in favour. The seeds if sown on a gentle hot-bed, in pots of rich soil, and abundantly watered, soon grow and make rapid progress. The plant is very satisfactory when planted out in beds and borders under glass, and when well mauged in such situation it is seen to perfection, especially if the house is a warm one. They should always be kept free from aphides, which is best done by fumigation. The plant does not require any great degree of heat to have it in bloom during the winter until April, if proper attention be paid to its requirements after it has flowered; in fact, it should be grown well, and the bulbs matured well, and then rested by turning the pot on its side in a shady situation during the month of July. In August it should be re-potted if the soil be soured, or root-space is too limited, otherwise re-potting is not necessary every year; and those which are cultivated in 10-inch pots will stand and flower satisfactorily for several years with an annual top-dressing of rich soil and good drainage. When a *Richardia* has filled its pots with roots, manure-water ought to be liberally afforded during the growing and flowering season. Place them under glass early in the month of September, and in many cases the plants will begin to produce spathes without forcing in the month of November, and afford a succession of them throughout the winter and spring. The plants may be forced slightly if it is desired to forward the opening of the spathes by placing those that are showing spathes in a warm-house. *Richardias* should

never be placed under the shade of other plants. There are several beautiful varieties, but none with a scarlet spathe like *Anthurium Andreanum*, but there is hope that this will come in time. The variety *R. nana*, "Little Gem," is very useful for forcing in 3 or 4½-inch pots for use in table decoration, and it requires a little more heat than *R. æthiopica* to get it into flower. The beautiful species, *R. Elliotiana*, with yellow spathe and spadix, and dark green leaves, mottled with white, is a fine acquisition. *B. W.*

MALMAISON CARNATIONS.

Plants that are now showing their flower-buds may be greatly benefited by a little clear soot-water or Davies' artificial manure dissolved in the water when watering them, on two occasions in each week. The plants should receive every attention with regard to watering and ventilation; never keep them closed up, except in very sharp and severe weather. The spread of leaf fungus is ensured by the plants not being sufficiently ventilated, and having too much moisture about them. Green-fly may be easily got rid of by fumigation, and this should be done as soon as they make their appearance, it being the fly which causes the spot on the young leaves. Plenty of air is very essential to the plants in many ways; it induces good strong, healthy foliage, which is always a sign of good cultivation. Old plants generally show flowers first, and they will bear a little forcing if the flowers are specially required early, but the practice is by no means satisfactory. It is far better to wait if possible, and have a fine display of good flowers. I have had over 1000 well-developed blooms expanded at one time, and such a number made a grand display when arranged in a suitable house. I prefer cuttings rather than layers as a means of propagation, having found them do better in my experience. I strike them in a gentle hot-bed about the commencement of May. A bed is prepared for them of stable-manure and leaves, with about 3 or 4 inches of cocoa-nut fibre refuse in which to plunge the pots. Cuttings should be taken from two-year-old plants, as these are not worth keeping longer. The cuttings are nicked to the joint, and then inserted singly in small 60-pots, and they root very freely. When they are rooted, let them remain for a time in the bed, and give them more air. The lights may be taken off altogether, except when very wet weather prevails. Potting should be effected when they are sufficiently rooted, and the plants returned to a cold frame in a sunny aspect. By August they will be ready for their flowering pots, and this will give them every chance to fill the pots with roots before the short days come. Use a compost of one-half good loam, and the remaining half peat and leaf-mould, mixing with it a little soot and a sprinkling of Thompson's Bone Meal, with a like portion of sharp sand. *G. H.*

about 1629, as may be seen in some of our oldest trees when cut up at the saw-mill. It is also on evidence that the disease exists alike in trees grown from seed imported from the Tyrol, as well as in those of home growth selected from the healthiest of British trees. [It is indigenous to high alpine regions, and is found on trees there a hundred years old. *Ed.*] It has been further satisfactorily proved that the chemical properties of soils do not determine or settle anything regarding the disease, for sound trees are found growing identically on the same quality of soils as others, virulently diseased. What is said of soils may with equal truth be said of both altitude and exposure, for neither do high altitudes always produce diseased trees, nor low altitudes sound ones. Exposures in like manner determine as little as altitudes do, so far, at least, as regards the form of disease under consideration, namely, blister.

rapidly. The blister in the Scots Fir, *Peridermium Pini*, operates very much in the same manner as in the Larch, but attacking the bark of trees that are not older than twenty-five years, gradually growing round the stem, but more vertically till it ultimately stops in great measure the ascent of the sap, causing the death of that part of the tree above the wound, and the top breaks off by the next gale. [According to the teaching of R. Hartig, see the *Diseases of Plants*, translated by Professor Marshall Ward and W. Somerville, p. 172: "How the disease occurs, whether by infection through wounds, or abrasions such as are induced by insects, wood-peckers, hailstones, &c., remains for the present undetermined. The mycelium spreads by intercellular growth amongst the cells of the cortex and of the bast, from which it proceeds by way of the medullary rays into the wood to the depth of about

FIG. 64.—LARCH DISEASE.

HOME CORRESPONDENCE.

**THE LARCH DISEASE.**—I will briefly recapitulate some of the statements I have made in these columns and elsewhere from time to time, on this no less important than regrettable subject, the Larch disease. I may state, in the first place, a few of the points upon which I assume all foresters are agreed; secondly, those on which they differ; and thirdly, I will indicate the best preventive means to ward off attacks of the fungus, for I do not say there is, or ever will be found, a cure for it. The disease termed blister, caused by *Peziza Willkommii* (figs. 64, 65), is neither a root nor leaf disease, but essentially a bark disease, in the same sense as we speak of skin-disease in animals. Blister is not restricted or confined to any particular stage of growth or age of the plants, but is found alike in the nursery, in seedlings of a year old, and in the transplanted lines at any stage of growth. It is also found existing in trees of fifty years' growth, and probably also in trees twice that age. Blister is not confined exclusively to any particular locality, nor to one country more than another, but is found to exist less or more in all parts where Larch is growing. It is also evident that blister has existed in the Larch ever since its introduction into this country

Seeing, then, that this disease in the Larch is so general, if not universal, the two-fold question still further confronts us, "Why this disease exists (or is at least supposed to exist), alone in the Larch tree and not in the Scots Fir, or in any other species of the various common forest trees growing side by side with it?" Before arriving at any settled conclusion on this point, however, let us pause, and distinguish between things that though they resemble each other yet differ. It is true that Larch is, on the whole, more affected by blister than any other forest tree with which we are acquainted, but that does not prove that other species of trees are not less or more affected. On the contrary, we find a very aggravated form of blister in the Scots Fir woods and plantations, and rather more prevalent in the natural forests, especially in the Pine-growing districts of Deeside, Strathspey, and the Highlands generally, than in artificial plantations. What mean those red-topped trees conspicuously studded all over our great Pine forests? Let us examine them, and we shall find blister as the producing cause, operating slowly in some cases it is true, but in others with marked

4 inches. . . . The top of a diseased tree of Scots Fir is specially liable to die during a warm, dry summer, when the wood, having for the most part undergone resinous degeneration, is unable to allow sufficient water to pass to compensate for the rapid evaporation from the crown." Branches and twigs on old trees begin to die after the trees have been diseased for a few years. *Ed.*] The Beech tree, also, is very liable to blister, and though it operates in a way different from what it does in Conifers, owing to the absence of resin in the sap, yet the same producing-causes are at work in the one case as in the other. In the Beech tree of any age, but more generally in old rather than in young trees, the disease makes its first appearance in the form of a small hole or puncture in the bark, as if done with an instrument, from which the sap exudes less and more abundantly in an ioky colour. These wounds seldom occur singly, but several generally appear together within a square foot of bark surface. By-and-by, the bark around the wounds assumes a dark-brown colour, and becomes detached from the tree, and when it extends all the way round the stem

which it frequently does, then the tree is doomed. [The infection by *Nectria ditissima*, the species of fungus causing canker in the Beech, takes place by means of wounds, abrasions, &c. Ed.] The Ash tree often suffers from blister, in the same way that the Beech, Larch, and Scots Fir do, but in the Ash it operates in a somewhat different way from what it does in the Beech. It commonly takes the form of vertical fissures in the bark, and seldom extends horizontally round the tree. By this form of development it will be seen that it is not so fatal to the tree as if it extended round the stem instead of up and down it. Indeed, it has been mistaken by some for the result of a slit made by a knife rather than a disease. I have said it is generally in longitudinal scars extending up and down the tree, but not always so, for it also, though less frequently, assumes a rough protruding excrescence over the whole surface of the tree affected; but even in this latter form it is seldom fatal to the tree. We might also classify that form of disease in Apple trees which the gardeners term canker, amongst those enumerated, but as I intend saying something more about the Larch blister, and to point out both its primary and secondary causes, I shall in the meantime close these observations. *C. Y. Michie, Cullen House, Banffshire.*

— This scourge of the Larch, under certain conditions of climate, soil, and locality is now well-known to be the result of a parasitic attack of a small fungus, *Peziza Wilkommii*, indigenous to the same regions in the Alps as the Larch. According to Hartig, in his *Diseases of Trees*, p. 121 (the latest and best authority on the subject), the Larch blister has been in evidence on the trees in these regions from time immemorial. "It occurs, however, with marked intensity in damp muggy valleys in immediate proximity to lakes (eg. the Achensee in the Tyrol, &c.), though on plateaus it may also destroy a small tree here and there. Owing to the prevalence of air-currents, freely-exposed Asocarps never ripen on plateaus and valley-slopes. The Asocarps ripen only on those blisters which are situated at the foot of the stem close to the ground, or on blistered branches that are in contact with the earth. This is owing to the surrounding high grass sheltering the young Asocarps against air-currents, and so keeping them moist." So far as anything has been proved by careful investigation in this country, the prevalence, or otherwise, of the blister on the Larch has followed the same lines as are so admirably set forth in this work of Hartig's, which should be closely studied by every forester who desires to be a master of his profession. The work has been skilfully translated into English by Dr. Wm. Somerville, and revised and edited by Prof. Marshall Ward, which is sufficient warrant for its technical accuracy and its adaptability to the wants of British readers. In the autumn of 1894, the English Arboricultural Society issued a series of queries in a circular to its members in reference to the Larch disease (properly called Larch blister, to distinguish it from other fell diseases to which the Larch is subject), and received replies, more or less complete, to the sixteen questions asked in the circular from forty members of the Society. Those replies came mostly from foresters and other members of the Society residing in the northern counties of England, or north of a line drawn from the Humber to the mouth of the Cheshire Dee, and probably included the worst districts infested with the Larch blister to be found in the United Kingdom. The returns thus obtained were placed in the hands of Dr. Wm. Somerville, the translator of Hartig's *Diseases of Trees*, who gave the results in an able and exhaustive "Report," which was published in the *Transactions of the Society*, vol. iii, part iv., pp. 363 to 386. That report gives, in a clear and concise form, the latest information available to the public, on the prevalence of the Larch blister in the districts reported upon, and suggests many points of the greatest value to those interested in the successful culture of the Larch. It does not seem to be known, however, to some of your correspondents in the district; but your correspondent on p. 167, Mr. A. C. Forbes, contributed to that report, and is no doubt familiar with the Larch disease known as blister in all its varied aspects, although his reference to the supposed absence of the blister from the Larch in Ireland requires qualification. Being interested in the condition of the Larch grown in Ireland for the past thirty years, I am of opinion that there is no appearance at the present time that the blister is increasing, either in its virulence on the percentage of trees attacked, and in many districts it is so rare or non-existent, that the owners of Larch plantations and their

foresters stand in no dread of its spreading. They may not be fully posted-up in the advanced theories for the existence and the suppression of the blister; but their methods of planting the Larch, almost invariably in mixed plantations, and the teachings of their own experience, not to plant Larch on low-lying sour soil, and in muggy spots—aided possibly by a genial climate, and the comparative absence of heavy snowfalls, and severe or late spring frosts—have rendered their efforts thus far an undoubted success. An individual tree, on a small area in an unsuitable spot, may be found, up and down over the country, severely attacked; but from Cape Clear to the Giant's Causeway, the robust health and vigour of the Larch, and its freedom from blister, is well known to every forester in the country, as well as to the timber merchants, and is a frequent source of note and observation to intelligent travellers in the Green Isle. In view of the contemplated promotion

FIG. 65.—PEZIZA WILKOMMI: Cluster Cups magn. 10 diam.; Section of Cup magn. 20 diam.; Spore Capsules or Asci magn. 400; separate Sporidium, magn. 1000.

(See "Larch Disease," pp. 434, 435.)

by the Government of extensive planting of forest trees in Ireland, the comparative immunity of the Larch from blister is a source of much encouragement; and by taking advantage of the knowledge already gained by science and experience, there is little to be dreaded from the ravages of blister in Larch plantations, such as they suffer from so severely in many parts of Great Britain. Heart-rot is a more insidious evil in Irish Larch, and spoils the sale of many promising fellings; but heart-rot is not blister, and when the nature of it is as well known as that of the latter, it will possibly prove to be more easily avoided. In hot seasons the aphid, *Chermes Laricis*, does considerable damage in some parts of Ireland to the foliage of the Larch; but although the aphid attack is said to open the door to the ingress of the fungus causing the blister, it has not yet been clearly proved, in Ireland at least, that the *Peziza* attack follows the aphid, and plantations badly infested with aphid for a few seasons have shown no tendency to become blistered in after years. The spores of the *Peziza* may not have

been present; but the fact remains that the aphid-infested Larch escaped the attack of blister. A careful study by a capable man of all the conditions and peculiarities of the locality it is desired to plant, will go a long way to insure success in forest planting, and will greatly mitigate the disappointments arising from the failure of Larch, or any other well-known trees, if it cannot absolutely prevent them. *Laricis.*

— There appears to be as great a diversity of opinion on the origin or cause of the Larch disease as there is on many of the other mysterious diseases affecting the animal and vegetable kingdoms. Having had the privilege of a long life, and had something to do with the management of woods, I may be permitted to give the result of my experience. On looking back sixty years, I can remember the Atholl woodmen making remarks on the Strathord plantations. They alleged the Larches in that district were not thriving, nor were they in a very flourishing condition where more extensively grown near Dunkeld. The trees had become branchy, abnormally fruitful, and cankered-looking. In course of time the stems and branches presented the usual features of ulceration. Some of these plantations have long since been removed. It was deemed expedient to fell them, because they had ceased growing, and it was found on cutting them down that many of the trees were frush or pumped at the core, as well as ulcerated. The curious and unfortunate circumstance connected with the subject is, that notwithstanding the diseased condition of these plantations, seedsmen were in the habit of sending cone-gatherers to them every winter to enable them to stock their nurseries, and supply the market with degenerated plants; and I believe this shortsighted and culpable practice continues. It was in this way the *Larix*, a native, as is well known, of the continents of Europe and America, which thrived well on being imported into this country about 150 years ago, has had its constitution degenerated. From the healthy appearance of the old trees still standing, and the congenial quality of the soil and situation in which they have been grown, it is obvious that the then Duke of Atholl, and other early importers, took and acted on the advice of the Swiss, Germans, or from whomsoever the plants were originally procured; and it is equally apparent, whatever the true cause of dry-rot or ulceration may be, that later on, in after years, when Larches were more extensively cultivated, sufficient care and skill were not bestowed in selecting suitable ground for them. I knew the quality of the soil of the Strathord plantations referred to, from the fact of my having seen the adjoining lands drained and cultivated. The soil is generally a black or brown loam, on a hard retentive subsoil, and, as usual, the thinnest, poorest, and most moorish land was planted. On visiting the district when the diseased trees were in course of being felled, the forester assured me "the roots having reached the 'till' years ago, the trees were making no progress. On the contrary, they were dying, and the sooner they were cut down the better." From all this I think we may fairly and reasonably deduce that the constitution of this most useful tree, of which we have adopted the two best varieties, the white and red, has been seriously impaired, and that either sort is now rendered unfit for planting out, even in favourable situations, with any prospect of the trees ever attaining a profitable size. I can remember, away back in the fifties, when I had the charge of estates in Inverness-shire, a remarkable instance of the feebleness, or deteriorated physical vigour of the Larch. We had a fine genial spring, like the present, which brought all the early trees into leaf before the usual time. Among the rest, a very promising Larch plantation of fifteen years old, when, most unexpectedly, about the beginning of May, a severe frost set in, and continued for some days, with the most disastrous effect. The foliage, which was fully developed, became as brown as a berry, and while many of the trees were killed outright, the survivors seemed only to make a struggle for existence. The stems and lateral branches soon began to ulcerate, and the whole plantation showed unmistakable signs of being irretrievably ruined. On examining the trees, as I frequently did with the forester, I saw the action of the frost on the ascending sap had burst the bark at the usual points, and from which the resinous fluid flowed freely; and, subsequently, I observed the ulcerations were not free from insect life, but the forester and myself were of the same opinion regarding the presence of the parasites, viz., that they were the

effect and not the cause of the disease, and came there to feed on the vitiated sap exuding from the trees. Excuse me for taking up so much of your valuable space; and allow me in conclusion to say that I am confident there is no cure for this malignant disease, except by importing seed and plants from the natural habitat of the Larch, and choosing congenial soils for their growth. *L. Caputh.*

**THE SEASON.**—The forwardness of the season is very marked in this neighbourhood, and the gardens have the appearance of the end of April rather than March. I cut a small dish of Asparagus on March 26, and another March 28, from a bed in a very exposed position. *H. J. McDonald, North Gate Nurseries, Chichester.*

**THE ROYAL HORTICULTURAL SOCIETY'S RULES.**

—Are these rules on judging to be of any practical use to those for whom they are intended? This question—unless by the members of the committee—still remains to be answered. Previous to publication, the rules were reported by some members to have been so thoroughly cooked, as to suit the palate of the greatest dyspeptic, and calculated to be of the greatest advantage to judges, as well as to soothe the temper and control the feelings of the most discontented exhibitor. Hitherto there has been no demonstration of welcome or note of appreciation for the enormous and protracted labours of the leading lights in British horticulture. This is surely extremely ungrateful on the part of interested horticulturists after receiving such a boon. But most people, I daresay, after reading the code, are suffering the same disappointment I experience myself. Instead of a proper system of judging collections, where the greatest diversity of opinion exists, and to which marked prominence should have been given, we find the chief feature embodied in the code is a dissection of the parts or properties of specimen vegetables, plants, and flowers. To the various properties which sometimes reach half-a-dozen, an estimate of value is given. This must be very trying to the memory of a judge; or will he carry the code along with him? Having devoted a fair share of attention to this subject, I am of opinion that such a division is quite unnecessary, and that cultural and natural value alone should form the basis for the calculation of the merits of any article or collection, with a maximum standard for each element, and a fixed ratio established between the two. This would be on the lines indicated by "Judex," p. 242, in criticising the method of judging collections. On p. 304, "A. D.," who, I assume, is speaking for the committee, says, "The points placed against the different kinds of fruit convey not so much actual as relative value." I suppose cultural and relative is meant. Why not define the relative? which is invariably the bone of contention. There appeared in these columns last year, or the year before, a method of judging collections which I think is the best solution of the matter at present before the gardening public. In that system two columns were provided, one giving a maximum of cultural value, indicated by units, and the other relative value, recorded by decimals. The value of the latter being fixed, unless a small deduction requires to be made for an inferior kind or variety, cultural merit alone remaining as the main issue for a adjudication. If this system could be adopted and affirmed by the same authoritative enactment which brought these rules to light, a weight of doubt and responsibility would be lifted from the shoulders of judges, and exhibitors would know before staging that superior kinds or varieties and cultural ability would each be appraised at its proper value. *Ayrshire Lad.*

—As an exhibitor and judge of some years standing at the principal horticultural shows annually held in this country, I wish to endorse the remarks made by "Judex" (p. 242) on paragraph 50 of rules for judging, and to say that the reply which his remarks have elicited from "A. D." (p. 304) does not in the least affect the case as put by "Judex;" as it is not a question of what the gentlemen who formulated the rules for judging meant, but simply the meaning which the rules, printed for the guidance of judges, exhibitors, and schedule makers, convey. By way of illustrating the relative value of the best all-round examples of the several kinds of fruits and vegetables as set forth in paragraphs 50 and 72 of rules for judging, I should like to be allowed to select two collections of twelve kinds each of fruits and vegetables named in the paragraphs indicated, awarding the maximum number of points allowed to each dish in the four collections, with a view to eliciting the opinion of some of those writers who kindly bestowed so much of their valuable time with

a view to supplying useful information on the questions of "relative value of exhibits," and the making of the awards accordingly, as well as that of the exhibiting and judging readers of the *Gardeners' Chronicle*, in order that sound information and a good understanding may be arrived at on the vexed question before the summer shows begin.

FRUIT.		FRUIT.	
(1) Collection of 12 Kinds.		(2) Collection of 12 Kinds.	
	Points.		Points.
Muscad of Alexandria	10	Pine-apple	10
Grape	9	Madrasfield Court Grape	9
Black Hamburg	8	Melons	8
Pears	8	Peaches	8
Apples	7	Figs	7
Plums	6	Apricots	6
Nectarines	5	Strawberries	6
Gooseberries	5	Cherries	5
Oranges	5	Medlars	3
Corrants	4	Damsons	4
Blackberries	3	Filberts	4
Walnuts	3	Mulberries	3
Cob nuts	4		
	73		73
VEGETABLES.		VEGETABLES.	
(3) Collection of 12 Kinds.		(4) Collection of 12 Kinds.	
	Points.		Points.
Asparagus	7	French Beans	7
Long-pod Beans	6	Cauliflower	7
Broccoli	7	Celery	7
Potatoes	7	Tomatoes	7

Cabbage	5	Turnip	5
Brussels Sprouts (picked)	5	Vegetable Marrow	5
Savoy	5	Globe Artichokes	5
Endive	5	Beet-root	5
	72		72

Thus, according to the new rules for judging, the two collections of fruit and the two collections of vegetables appearing in parallel columns are placed equal in each case, notwithstanding the fact that the respective collections set out in the right-hand column are obviously superior to those enumerated in left-hand column. The "pointing" is certainly at fault, and should the like happen in practice, following the publication of the Royal Horticultural Society's *Rules for Judging*, it would undoubtedly afford very strong grounds for dissatisfaction being expressed on the part of exhibitors, seeing that according to the real relative value of the individual exhibits there is room for two collections between the two examples given above—that is, room for a second and third—if properly "pointed." Muscad of Alexandria, is properly enough accorded ten points in the code of rules. Foster's Seedling, Buckland Sweet-water, and Golden Queen should not be valued at more than eight points. Madrasfield Court should have nine points, and Black Hamburg one point less. The above refers to Grapes shown during May and four following months, and the following estimate refers to Grapes shown in October and following months: Mrs. Pearson (golden, and of Muscat flavour), nine points; Trebbiano and other whites not named above, eight points; Mrs. Pince's Black Muscat and Gros Guillaume nine points each, and eight points each to Lady Downes, Black Alicante, Gros Colmar, and Gros Maroc. A Pine-apple should be given two points more than Muscad of Alexandria Grape, namely twelve points. A Melon should receive a point more than Peaches, and the latter one more than Nectarines; and Pears should be given a point less than Nectarines. The four last-mentioned fruits are valued at eight points each in rules for judging (page 12), and in which Apples and Figs are accorded seven points each, and Apricots and Plums six points each. Surely Figs and Apricots are superior in every way to Apples and Plums, and the same may be said of Cherries as compared with Gooseberries, which are allowed five points each; and Medlars and Mulberries certainly deserve a point more each than Blackberries—two points being ample for the latter. In the matter of vegetables, Cauliflower is placed on a level with Broccoli. The former, it is stated in paragraph 73, is included in Broccoli, and for exhibition purposes is not distinct from it. This is not quite correct, since the one is quite distinct from the other in growth and quality of "flower"—there is, in fact, as much difference between them in point of growth and quality as there is between a climbing French Bean and a Scarlet Runner. The method adopted from page 16 to page 20 (inclusive) in showing how the number of points allotted to each of the thirty-two kinds of vegetables dealt with are made up is a good one. Although, singularly enough, quality is only accounted for in three cases out of the thirty-two; namely, Beetroot, Seakale, and Vegetable Marrows. Generally the points are made up in this

way—size and form, 2; fleshiness, 2; condition, 2; and colour, 1; total 7. For Runner and French Beans, and in one case—plants of Brussels Sprouts—"cropping qualities" are, in addition to the other conditions, allowed two points. *Pro bono Publico.*

**FORMING A HERBACEOUS BORDER.**—My good friend, Mr. Crump, does not approve (see p. 399) of planting bulbs in herbaceous borders, on the ground that they (the bulbs) are better planted in a border by themselves, adding "the reasons for this are obvious, viz., bulbs do best when left undisturbed for a number of years; whilst herbaceous plants should be mainly replanted once in two or three years. Moreover (Mr. Crump remarks), when the bulbs are in a dormant state, the workman's feet or spade come in dangerous contact with them." The only bulbs referred to in my note on forming a herbaceous border (p. 360) are "Snowdrops and Scillas," which I advised to be planted together with the Aubrietias in tufts from 3 to 9 inches from the edge." As a matter of fact, however, I grow various other kinds of bulbs in the openings between the herbaceous plants, such as Narcissus, Hyacinths, Tulips, &c., and with perfectly satisfactory results as regards both classes of plants. The bulbs have been deeply planted. Hence they are "left undisturbed" from one year's end to another. They do not in any way interfere with the herbaceous plants, and *vice versa*. None but experienced and careful workmen are allowed to work among the plants; and a five-tined digging-fork is used to plant the annual manurial dressing into the border. This implement being generally used in reducing over-grown plants to their proper dimensions, spades and careless workmen being rigorously excluded from the herbaceous borders. I may here remark that the Crocuses, &c. in the beds in our Italian garden have not been disturbed for nearly a quarter of a century, although the beds are manured and dug every year prior to planting for summer and early autumn effect. The bulbs are, or rather were, planted some 14 or 15 inches from the surface, thereby doing away with the labour of taking up and re-planting of the bulbs every year. Reverting to herbaceous borders, I should like to ask Mr. Crump what would there be in them in January, February, March, and April, to attract attention, were it not for the floral display then produced by bulbous plants? Why, a herbaceous border in spring without the aid of bulbs would be blank and very uninteresting indeed, when compared with one close by bright and fragrant with spikes of Hyacinths, consisting of flowers of various delicate and telling shades of colour, Narcissuses in variety, Tulips, &c. Perhaps at no time in the year are flowers out-of-doors so cheering and so highly appreciated as during the above-mentioned months. No doubt, Mr. Crump will be pleased to learn that my list of herbaceous plants include the species which he mentioned at p. 399, and a good many others besides. The plants named in my note, p. 360, were mentioned to illustrate the way in which herbaceous subjects should be arranged in planting, as much as owing to the fact of their being representative kinds and varieties of the very interesting and useful class of plants to which they belong. *H. H. W.*

**GARDENERS AND MACHINERY.**—It is difficult to understand Mr. Mawson's preference for the scythe over the more-modern implements which mechanical skill has placed at the service of the gardener. For my own part, I must confess that I consider the garden labourer who can manage a steam or other mechanical lawn-mower, to be certainly as cunning a workman as the one who can wield a scythe in a proper and effective manner. At the same time, I claim to know the respective merits of a church organist and of the man who turns the handle of a street instrument. I can claim also, I think, the ability to appreciate the difference in artistic value between a piece of hammered iron-work when good and a cast-iron substitute. No doubt Mr. Mawson is right in saying that real handicraft is pushed aside in modern days by the mechanical production of articles of daily use, but this is inevitable in view of the enormous demand; it does not follow, however, that the users of these things cannot distinguish between artistic and simple utilitarian work. I have the greatest respect for the landscape gardener's branch of horticulture, and will yield to few in appreciation of genuine artistic results therein. In fact, I look upon the out-door portion of a garden as the most enjoyable, and a well-kept pleasure-ground as affording more real delight than the best furnished glass-house. I would remind Mr. Mawson that gardeners have to attain certain results, and any means that enables them to do this in the quickest and best way will be welcomed by them; they have no time to waste on

studying the picturesque in workmen or implements. Scythe work, now-a-days, is slow and inferior compared with machine-work where any great quantity has to be done. I do not understand the application of the word "commercialised" in connection with the use of mechanical contrivances in gardens, nor do I see how a gardener's prestige, whatever that may amount to, can be lowered by such use. Private gardens are already "commercialised," in too many instances, in another way. *G. Don, Hawkhurst.*

## SOCIETIES.

### ROYAL HORTICULTURAL.

#### Scientific Committee.

MARCH 24.—A letter was read from Dr. Masters respecting the diseased Carnations submitted to the committee by Mr. Peters, in which he states that the leaves are damaged by a species of eelworm, and advises that the plants should be burnt, as there is no cure for them.

Dr. Russell reported that he is about to begin, conjointly with Mr. Wilks, the planned experiments on the coloration of Apples. Meanwhile, he has analysed and determined the ammonia in the soot which is to be used in these experiments, and found it to contain 4 per cent.

Mr. Colvill Brown, of Hextable, Kent, sent a specimen exhibiting a very remarkable interpenetration of a shoot of a Potato passing right through the substance of another Potato in an oblique direction. [This is probably due to the formation by the shoot of a solvent substance, which enables it to soften and dissolve the tissues with which it is in contact].

### READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

MARCH 23.—A paper on Roses was read by the Rev. ALAN CHEALES before a crowded meeting of the members of the Reading and District Gardeners' Mutual Improvement Association on Monday. The lecture was very practical in treatment and interesting, and was enlivened by witty sayings, poetry, and tales of the ardent and disappointed exhibitor. The subject was very appropriate, seeing that the National Rose Society, in conjunction with the Reading Horticultural Society, will hold their show at Reading in June next.

Mr. CHEALES commenced his paper by saying that it had long been his wish to make the acquaintance of the association, yet when he received the kind invitation from their secretary, it was with some amount of trepidation that he accepted the same, as he knew he would have to speak to practical men; still, he yielded to no one in his devotion to the queen of flowers, and he could give them an experience, as a grower and exhibitor, extending over thirty years. When he delivered a lecture on "Roses" before the members of the Reading Literary and Scientific Society, he devoted himself entirely to the literary and scientific side of the question, and not so much to the practical part; therefore, when coming to speak to practical men, he decided to treat the subject from a practical standpoint, thus his paper would really be "Rose Culture."

By desire he would divide his paper into two parts, so that discussion could take place at the middle and end, thus ensuring all points being thoroughly discussed. First, Roses in general. Preparing the ground, planting, protecting and pruning. Many valuable hints were given under the various headings, the following being specially worthy of notice. The ground should always be well prepared for Roses, as no other flower answered so readily to kind treatment. November was considered the best month for planting. Hybrid perpetuals would stand 20° of frost, and Teas 10°. Earthing-up was certainly the best protection for Teas. Hard pruning always gave the best results. For H. P.'s the last week in February he found the best time for these, and the last week in March for Teas. For climbing Roses the knife should be spared as much as possible.

The second part of the lecture was devoted to propagating, hybridising, and obtaining blooms for exhibition. The quickest results were obtained by budding, but attention should be given to the raising of cuttings and seedlings. A few years back France was to the front with seedling Roses, but latterly England has rapidly come to the front, and far outstripped her neighbours across the sea. Cuttings should be inserted in October, and if all went well they would make nice little plants for planting out the following June. Many valuable hints were given on obtaining Roses for exhibition purposes, syringing, and the best means of protecting from sun and rain. As to the best Roses for exhibition he would refer them to Mr. Mawley's annual audit in the *Journal of Horticulture*, but for the best six Roses for all purposes, three H. P.'s and three Teas, he would give them Maria Baumann, A. K. Williams, Mrs. John Laing, Maréchal Niel, The Bride, and Souvenir d'Elise Vardon. Reference was also made to hybrid Teas, which seems to be the Rose of the future; climbing Bourbon, Austrian Briars, Sweet Briars, Noisettes, Lord Penzance's Seedling Briars, &c. The lecturer concluded by strongly urging as many as possible to compete for the valuable prizes at the forthcoming Rose show, and trusted that Reading would do credit to the most

popular of flowers. A very interesting discussion took place, in which the Chairman (Mr. T. NEVE), Messrs. TURTON, BOWIE, WOLFFORD, J. MARTIN, T. MARTIN, LEES, &c., took part. The interest was greatly enhanced by the beautiful collection of flowers that were brought by the following members:—Mr. TURTON, Maiden Erlegh Gardens, Roses of various varieties, and Violets; Mr. BRIGHT, Whiteknights Park Gardens, a large bunch of Maréchal Niel Roses; Mr. Hobbs, gr. to W. B. WILLIAMS, Esq., Caversham, Maréchal Niel and Niphetos Roses; Mr. Lees, gr. to Mrs. MARSLAND, The Wilderness, Violets; and last, but not least, some grand specimens of *Primula obconica* by Mr. Townsend, gr. to SIR WILLIAM FARRER, Sandhurst Lodge. A hearty vote of thanks was accorded to the lecturer, and to those members who had brought the flowers.

### TORQUAY GARDENERS' ASSOCIATION.

MARCH 25.—There is every prospect of the flower-shows organised by the Torquay Gardeners' Association becoming permanent institutions. With the disappearance of the old horticultural society last year, the association tried the experiment of a Chrysanthemum show. The result established beyond dispute that there is room in Torquay for first-class exhibitions, and the association decided to arrange for two shows this year, of which the first was given on the above date. This was a great success, with three times the number of entries there were at the autumn show. The larger Bath Saloon never looked gayer.

Mr. F. C. SMALE, the hon. sec., planned the exhibits with excellent effect. Instead of massing all the groups as hitherto around the walls, he placed one of the most conspicuous, that sent by Messrs. BURRIDGE, across the centre of the hall, where, with towering Palms and beautiful flowers, it formed a capital centre-piece. On one side in the middle were the circular groups, and on the other the table decorations and specimen plants. Around the walls were arranged the great bulk of the exhibits, including the most noteworthy feature in the show, Mr. J. SNELGROVE'S fine group of rare plants. Among the plants were many choice Orchids. There were groups of these plants exhibited for competition by Miss LAVERS, of Upton Leigh, and Captain FANE TUCKER, the former easily meriting the 1st prize it obtained.

Torquay has been noted for the freedom with which out-of-doors shrubs flower in winter, as much as for its unrivalled climate. Consequently its exhibit of flowers by Mr. H. A. GARRITT, town gardener, was peculiarly interesting. There were about sixty flowers and shrubs represented in the collection. CURTIS, SANFORD & Co., of the Devon Rosery, were, as usual, represented by a large group. Mr. W. B. SMALE'S group occupied the whole of one end of the hall. There was a remarkable abundance and variety of bloom. R. VEITCH & SON, Exeter, sent down a large display of plants, including choice Orchids. There were also displays by BEACHEY, JENKIN & Co., W. ALLWARD, and HORN.

During the afternoon, and again in the evening, Mr. G. Lee, gardener at Upton Leigh, read an interesting paper on "Orchids: their Fascination and Romance."

Specimen Orchids, to illustrate the lecture, were lent by Miss LAVERS; and Mr. A. SHELLY of Tudor Lodge sent several delightful paintings of Orchids. *Extracted from Western Morning Times.*

### THE PEOPLE'S PALACE HORTICULTURAL.

MARCH 26, 27, 28.—This was the first of three exhibitions held annually by this rapidly growing Society, and proved in all respects most satisfactory. The exhibits consisted mainly of spring-flowering bulbous plants, and they were arranged upon tables in the spacious winter-garden, and formed an attractive foreground to the specimen-plants, evergreen and deciduous, in that building, the former comprising some fine Palms. The entries were quite numerous in most of the classes: there were as many as nine in the class for six Hyacinths, and the quality of the spikes showed a great improvement upon those seen last year.

It has been found necessary to group the exhibitors under two sections, the one comprising exhibitors who grow under the more favourable conditions, such as the outskirts of Victoria Park, and the more open and airy districts, and those who inhabit what is known as the congested districts, such as Mile End, Limehouse, Stepney, Poplar, Bethnal Green, &c. In both sections there exist classes for collections of plants to fill a certain amount of table space, and for flowering and foliage plants, of which some good specimens were staged. Hyacinths were numerous and effective; in the classes for single specimens of various colours, the entries averaged from fifteen to seventeen. Some remarkably well-bloomed Tulips were staged, Keizer's Kroon, Van der Neer, and Rosa Mundi being the favourite varieties; the blooms of the first-named were particularly fine in some instances. Narcissus were represented by well-grown and finely-bloomed examples of the Polyanthus type. Pots of Crocus and Scilla sibirica were also staged; also *Dielstra spectabilis*, *Astibe japonica*, Aurionias, Polyanthus, &c. There is a separate children's section, which produced flowering and foliaged plants.

In the Queen's Hall, Messrs. W. PAUL & SON, Waltham Cross, had a large table covered with boxes of cut blooms of *Camellia*, &c.; and Messrs. W. CURTIS & SONS, Highgate,

an imposing group of flowering and foliaged plants. The attendance of the public was good.

It may be added that a series of lectures of an elementary character on some aspect of town gardening, is given monthly, the attendance averaging 200 persons; and many questions are put to the lecturer. A social meeting likewise takes place once a month, to which the members are invited to bring any plants or flowers of interest, and it is also well attended. Altogether, the society is to be congratulated upon its success, and the impetus it has given to the growing of plants in a part of London not too favourable for gardening pursuits.

## FLORISTS' FLOWERS.

### AURICULA GOSSIP.

In the obituary notice of *Gardeners' Chronicle* for February 29, p. 275, is recorded the death of Mr. John Morris, an old fancier of the Auricula. One feels the loss of these old florists. I have held most interesting conversations with many of them specially bearing on the subject they had most at heart—the Auricula, and when the Auricula is mentioned in connection with these men, it is the "edged" varieties only which are meant. In my early days, the three leading growers were Richard Headley of Stapleford, Robert Trail of Aberley, N.B., and George Lightbody, Falkirk. I was personally acquainted with Mr. Alexander Meiklejohn, Mr. Chas. Jeffrey, and Mr. Peter Campbell. They thoroughly understood the requirements of each variety, and nothing pleased them better than to tell all they knew to younger fanciers eager for information. I bought many plants from Mr. Meiklejohn when I first started, but from my point of view he would generally repot them in over-rich compost, and added to this, a still richer top-dressing in February. There was nothing but frame culture to be seen in his garden at the Raploch, so that the full bloom did not usually come on until the early days of May. Mr. Meiklejohn had one of the largest collections of Auriculas, some 1500 plants, but I do not think he ever tried to raise seedlings. He, however, sent out two varieties produced by a neighbouring farmer named Kay: one, a fine grey-edge, Alexander Meiklejohn; and a dark self, Topsy. I well remember his remarks as we were walking over the bridge at Stirling to visit another grower's collection at the Bridge of Allan—"I am the happiest and man in Scotland." Mr. Peter Campbell's collection was a small one in comparison to Mr. Meiklejohn's, but he was a raiser of new varieties, and found much pleasure in enriching other collections besides his own. His greatest effort was raising what the fanciers termed crimson-selfs, Duke of Argyll and Marquis of Lorne. The two were raised from one pod of seed, I believe of Berry's Lord Lee, but the difference in the constitution of the two varieties is very remarkable. I bought a plant of each, and soon had fifty plants of the Marquis, but the Duke could scarcely be coaxed into growth, and I never was able to obtain an offset from it. Admiral Napier, a green-edge, was grown, and thought highly of for some years, but it is now never seen in a prize collection, nor any other of the late Mr. Campbell's varieties. I have raised some thousands of show Auriculas, and can boast of but one or two that holds a place in the best twelve, viz., Abbé Lizst and Conservative. Lightbody raised one that may well be admitted into the best twelve, Richard Headley. Trail is represented by Prince of Greens, a variety with the best green-edge of any Auricula. Headley, however, still holds the highest place with George Lightbody. Mr. Simonite, of Sheffield, has a high position with the Rev. F. D. Horner. Mr. Horner has raised the best self in Heroine; while to Mr. Read, a old florist, now no more, belongs the credit of obtaining the best white edge in Acme. One cannot think of the old florists without making some mention of their work, and it is very remarkable when we come to analyze this how few varieties of real merit have been handed down to us, showing that there is greater difficulty in raising good new varieties of Auriculas than of any other garden flower. But florists of the old school possess great patience,

and the failure of one season does not restrain their ardour in trying again on almost the same lines. "Hope springs eternal in the human breast," and the pleasures of anticipation is sometimes their sole reward.

THE CARNATION.

On p. 34 were given some remarks on the preparation of the soil for repotting, &c. The time has now arrived when re-potting should be commenced. The first thing to attend to is the arrangement of the plants, and if there are any losses to be made good, the same should be made note of at once. Most florists place their plants under umbrellas, beginning with the scarlet bizarres, and following on with crimson bizarres, pink and purple bizarres, purple flakes, scarlet flakes, and rose flakes. Then come the self-coloured and fancy varieties; the white-ground Picotees also follow in regular sequence, viz., red-edged, purple-edged, and rose-edged; and, lastly, the yellow-ground Picotees. Many private collections contain some hundreds of varieties, and if they were not carefully arranged and numbered in their classes, it would be difficult to find any variety at a moment's notice. The pots are washed and crocked carefully, and the drainage covered with some fibrous material. The soil should be pressed rather firmly around the roots, and two or three plants are put in 8 or 9-inch flower-pots, according to the size and vigour of the different varieties. The plants before repotting should be moist at the roots, and the soil that is used moderately so; no water will then be required for about ten days, according to the weather. If the weather is severe or heavy rains fall, the plants should be protected by glass-lights. The plants should be freed from green-fly by fumigating or dipping.

Tree Carnations now forming roots should be potted off as they require it. They must not be suddenly exposed to cold at first, for even the hardest plants will be injured if removed to a draughty greenhouse from a close frame in a forcing-house. It is best to effect the potting of young Carnations while still in the warm-house. It is in the omission to attend to such details of this work that so many failures occur. When the plants are established, gradually inure them to a cooler place; they do best in a garden-frame until the end of May, and after that time place them out-of-doors. They may be planted out in the open garden to be lifted in September or October, or be cultivated in pots during the whole season. *J. Douglas.*

MR. CHARLES LEDGER.

It is not generally known that we have still amongst us (at Kenmore, near Goulburn, New South Wales), Mr. Charles Ledger, famous in two hemispheres for the introduction into Java, after most perilous adventures, of the most valuable variety of Australian alpaca and other animals into New South Wales, only accomplished, like his previous venture, after much vicissitude and actual peril.

It falls to the lot of very few men, either in Australia or out of it, to have been the means of doing so much good to their fellow-men as Mr. Ledger has been able to effect by his introduction of Cinchona Calisaya, var. Ledgeriana. The old gentleman is still hale and hearty, and it occurred to me that this journal would be a particularly appropriate medium by which to remind our raisers of "new products" in New South Wales of the Cinchona enterprise, which, although forty years old, should be fresh in the memories of the present generation.

As regards the Cinchona, Messrs. Howard and Sons, the great quinine firm, wrote to Mr. Ledger quite recently—"It is not too much to say that it is entirely owing to the seed received from you that Java is now supplying the world with quinine. Some of the cultivated Bolivian bark is of quality equal to the Java bark from your seed, but it seems that the cost of cultivation is much greater than in Java."

To which Mr. Ledger remarks, in a note to me:—"The expenses of cultivation are not greater in Bolivia. It is the distance from port of shipment that causes greater extra expense than in Java. From where cut, the bark is carried on the backs of Indians out of the Monte at least 20 to 100 miles, then from 300 to 1,200 miles on doukeys or llamas to La Plas (city of 60,000 inhabitants); there it is put up in packets of 150 lb. net of bark, covered with half a bullock hide (no return allowed for hide when sold), and carriage to Tacna by mules, 285 miles, then 40 miles by rail for shipment at Arica. Export duty in my time, or up to 1853, 20 dollars per quintal of 100 lb."

Messrs. Howard & Sons again write:—"There is certainly no doubt of the importance to the Dutch plantations in Java of the seed supplied by you in 1865. Almost the entire supply of bark from Java is sold as Ledgeriana, and comes from that supply. The only complaint that they could make would be that it has turned out so rich that they are supplying too much for the world to consume. C. succirubra from India and Ceylon is rapidly becoming a thing of the past. English Government plantations apparently fail to propagate your seed to more than a very small extent, and a great deal of Ledgeriana, which is grown in Ceylon, is from Java seed. It is difficult to give exact figures, but the quantity of bark from your seed now produced per year cannot be far short of 10,000,000 lb."

Although infinitely less important to the world than the Cinchona venture, Mr. Ledger's alpaca expedition has rendered him better known to Australians, and the story of the alpacas is familiar to people who lived in Sydney thirty or forty years ago. *Agricultural Gazette of New South Wales.*

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, including London, S.
- Principal Grazing, &c. Districts—6, Scotland, W.;
- 7, England, N.W.; 8, England, S.W. 9, Ireland, N.;
- 10, Ireland, S. \* Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending March 28, is furnished from the Meteorological Office:—

"The weather during this period varied considerably from time to time, but was generally fine and warm during the earlier days, and unsettled, colder, and rainy towards the end of the week. Thunderstorms occurred at several of the English stations about the middle of the week.

"The temperature was again above the mean, the excess ranging from 1° in 'England, N.W.,' and 'Ireland, N.,' to 5° in 'England, E.,' and 6° in 'England, S.' The highest of the maxima were recorded either on the 22nd or 24th, when they ranged from 69° in 'England, S.,' and 67° in 'England, E.,' and the 'Midland Counties,' to 57° in 'Scotland, N.,' and 'England, N.W.,' and to 56° in 'Scotland, W.' The lowest of the minima were registered on the 27th or 28th, and ranged from 26° in 'Ireland, N.,' and 29° in 'Scotland, N.,' to 34° in 'England, S.,' and to 40° in the 'Channel Islands.'

"The rainfall was less than the mean in 'Scotland, E.,' 'England, S.,' and the 'Channel Islands,' and just equal to it in the 'Midland Counties' and 'Scotland, W.' In all other districts there was an excess, that in 'England, N.W.,' being large.

"The bright sunshine was rather less than the mean in Ireland and the north of Scotland, and only just equal to it in the east of Scotland; over England and the west of Scotland, however, there was an excess. The percentage of the possible duration ranged from 52 in 'England, S.,' and 51 in the 'Channel Islands,' to 31 in 'England, N.W.,' and 24 in 'Scotland, N.,' and 'Ireland, N.'"

MARKETS.

COVENT GARDEN, APRIL 1.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

SEEDS.

LONDON: April 1.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E. state that for the time of year an unusually small business is passing in field seeds. In fact, a spell of fine drying weather is now greatly needed, to enable sowing operations to be proceeded with. Meantime all descriptions of Clover and grass seeds are held at the low quotations previously noted. For Tares the inquiry is meagre. Rape seed keeps firm, but Mustard is neglected. In Peas and Haricots there is some slight improvement. The birdseed trade is featureless. Scarlet Runner and Canadian Wonder Beans are now extremely cheap.

FRUIT AND VEGETABLES.

BOROUGH: March 31.—Quotations:—Savoys, 4s. to 4s. 6d.; Cabbages, 2s. 6d. to 3s. per tally; Onions, 3s. 6d. to 4s. 6d. per bag; Carrots and Turnips, 2s. to 2s. 9d. per dozen bunches; Horseradish, 8s. to 10s. per dozen rolls; Apples, 4s. to 6s. per bushel.

SPITALFIELDS, March 31.—Quotations:—Broccoli, 6d. to 1s. per bag; Kale, 6d. to 1s. do; Parsnips, 6d. to 8d. per score; Parsley, 1s. to 1s. 6d. per dozen; bunch Greens, 1s. 3d. to 2s. per dozen; Rhubarb, 1s. 6d. to 2s. per dozen bunches; Leeks, 1s. to 1s. 6d. per dozen; Onions, spring, 1s. to 1s. 6d. per dozen bunches; Cabbages, 2s. to 2s. 6d. per tally; Seakale, 8d. to 9d. per punnet; Turnips, 1s. 6d. to 1s. 9d. per dozen bunches; Carrots, 1s. 9d. to 2s. do.; Turnips, per ton, 25s. to 28s.; Carrots, household, 2s. to 2s. 6d.; green Carrots, 15s. to 17s. 6d. do.; Apples, dessert, 6s. 6d. to 8s. per bushel; do., cooking, 5s. 6d. to 6s. 6d. do.

STRAFORD: March 31.—Quotations:—Greens, 1s. 3d. to 1s. 6d., loose; do., 1s. to 1s. 6d., bunches; Cauliflowers, 1s. 6d. to 1s. 9d. per dozen; do., 8s. to 7s. 6d. per crate; do., 6s. to 7s. 6d. per tally; Scotch Kale, 6d. to 9d. per sieve; Sprouting Broccoli, 8d. to 9d. per sieve; Turnip-tops, 9d. to 1s. per bag; Bestroot, 4d. to 6d. per dozen; do., 1s. 6d. to 1s. 9d. per bag; Horseradish, 1s. per bundle; Parsley, 1s. to 1s. 6d. per dozen; Rhubarb, forced 1s. per dozen; do., field, 1s. 6d. to 2s. per dozen; white Turnips, 1s. 6d. to 2s. per dozen; do., 1s. 6d. to 1s. 9d. per bag; Leeks, 1s. 6d. to 2s. per dozen; Spring Onions, 1s. to 1s. 6d. per dozen; Salad, 1s. 6d. per dozen; frame Cucumbers, 3s. to 5s. per dozen; Carrots, household, 20s. to 24s. per ton; do., ostle-leading, 20s. to 22s. do.; Parsnips, 4d. to 6d. per score; Mangolds, 12s. to 17s. per ton; Swedes, 10s. to 18s. per ton; Onions, English, 60s. to 70s. per ton; do., Dutch, 2s. 6d. to 3s. per bag; do., Bordeaux port, 4s. to 5s. 6d. per case; Apples, English cookers, 3s. 6d. to 5s. 6d. per bushel; do., Nova Scotian, 17s. to 18s. per barrel.

FARMINGTON: March 31.—Quotations:—Spinach, 1s. per bushel; Leeks, 1s. 6d. per dozen; spring Onions, 2s. 6d. per dozen bunches; Turnips, 2d. per bunch; Carrots, 2s. 6d. per dozen; Onions, 2s. per bushel; Mushrooms, 6d. per lb.; Tomatoes, 1s. per box (Canary); Cauliflowers, 1s. per dozen; Apples, 20s. to 25s. per barrel; Carrots, 20s. to 25s. per ton; Parsnips, 10s. to 15s. do; Rhubarb, 1s. 9d. to 2s. per dozen; do., forced, 1s. to 1s. 3d.

caused dark blisters; but these are so filled with sand as to render microscopical examination with high powers impossible. Thus far, no fruit has been found. Possibly a growing bulb, in a later stage, might furnish materials for identification. On some of the spots a superficial mould (Aspergillus?) has established itself, but would not cause the spots, as it is a saprophyte. The conidia are profuse, globose, and minute. Dampness is favourable to the development of fungi, so that when kept dry the growth is checked. It is doubtful whether any bulb can be saved after it is once attacked; some solution of sulphate of copper, or iron, or even Condy's fluid, might be tried. M. C. C.

NAMES OF PLANTS: R. Sharpe. Chionodoxa sardensis. — W. H. R. Rhododendron Falcoveri, perhaps. We cannot tell without the leaf.—Reader. 1, Kerria japonica; 2, Ornithogalum nutans; 3, Muscari botryoides.—G. K. 1, Andromeda calcinata; 2, Thuja Vervaeckiana; 3, Cryptomeria elegans.—Oakfield. Omphalodes verna.—Constant Reader. 1, Fumaria bulbosa; 2, Muscari botryoides; 3, Asarum europaeum.—J. M. C. 1, Pellaea rotundifolia; 2, Blechnum polyopodioides; 3, Lastrea decomposita; 4, Asplenium bulbiferum; 5, Selaginella caulescens; 6, Fittonia argyrea. We cannot name garden varieties of Camellias.—J. B., Kingston. Dendrobium Findlayianum.—A. B. 1, Lycaste Deppii. The yellow one is probably L. creuenta. 2, Cornus mas (the Cornelian Cherry); 3, Eupatorium Weimannianum; 4, Pteris hastata macrophylla; 5, Asplenium viviparum.—S. G. J., Sunderland. Dendrobium aggregatum.—H. B. That with orange in the lip is Dendrobium Wardianum, the other Dendrobium pulchellum, commonly called D. Dalhousianum.—J. C. Diosma ericoides.—Ten Years' Subscriber. The leaves are affected with what is known as "spot." Probably some errors or accidents in cultivation has caused it.—W. T. B. Zephyranthes Atamasco.—E. J. 1, Selaginella Wildenovi; 2, Colocasia atropurpurea; 3, Begonia Marshalli; 4, Begonia Louise Chretien; 5, Begonia Madame Anna Lowe; 6, Begonia sanguinea.—L. J. Marie Louise.

RICHARDIA: S. E. S. C. The production of a second spathe, or of a white leaf below the usual spathe, is not at all uncommon. We receive every season several specimens, and are surprised that our enterprising gardeners have not long ere this attempted to "fix the sport."

TOMATOES, MELONS, AND SEEDS: J. B., Chelmsford. If you have a continuous bed of soil, plant the Tomatoes at 2 feet apart, and the Melons in pairs at 3 feet apart, or even a little more. The seeds are those of some species of Gourd.

VINES: A. P. With very great care in lifting and root-pruning, doing these operations before the leaves fall, it might not be risky to force the Vines for early Grapes the same season; although, under ordinary circumstances, or if the Vines were in a very bad state at the roots, they should have been allowed to start naturally. You ought to cut off the bunches, and encourage as much leaf-growth on the Vines as can well be fully exposed to direct sunlight, and force them very gently. There is at present no balance between top-growth and root-growth. The border of the other vinery is in a bad condition, and you should clear off the wet stable-litter, lightly fork up the surface, and leave it exposed. In the autumn make an examination of it, and let us know the result.

The Pioneer of cheap, simple, and effective heating for small Greenhouses.

REDUCTION IN PRICES.

Owing to improved facilities for the manufacture of these Boilers, and a consequent cheapening in the cost of production, we are enabled to reduce the prices as follows:—No. 1, £2 12s.; No. 2, £3 15s.; No. 3, £5; also larger sizes. Complete Apparatus from £4 8s. Lists and Estimates on application.

MESSENGER & CO., Loughborough, Leicestershire. London Office: 96A, VICTORIA STREET, WESTMINSTER, S.W.

"FRIGI DOMO" CANVAS. (REGISTERED TRADE MARK) To be obtained of all Nurserymen and Florists.

EUCHARIS GRANDIFLORA: C. N. M. The bulbs are failing to flower owing to their being too tightly packed in the pot, with the consequent lack of nutriment. In June, shake out the bulbs, and repot the largest in several 8-inch pots in rich sandy loam (manure can always be afforded in the liquid form); stand in a temperature of 70° or 80° with shade when the sun shines, keeping them close till growth begins. In September place them in a cooler house, affording rather less water; and in November keep them somewhat drier, but never dry. This is the treatment of bulbs required to flower in the winter. The small bulbs should be potted up by themselves, receiving identical treatment in the summer as the bulbs of flowering age, and be kept gently growing always, only partially withholding water in winter.

GLOBE THISTLE: J. B. The vernacular appellation of species of Echinops.

INJURED ROSE-LEAVES: Roses. Probably the work of the Rose-sawfly.

LILIUM AURATUM: Incog. Lilium. The crown of your bulb of Lilium is attacked by some fungus, which

#### GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are especially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

### SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

Has stood the test of the principal growers for over 20 years, and is admitted to be the Best for all Horticultural Purposes. In boxes, 1s. and 2s. 6d.; bags, 50 lb., 8s.; 1 cwt., 15s. May be obtained through any Seedman; or, direct (bags only), carriage paid, and liberal discount for cash with trial order, from W. H. BEESON, SHEFFIELD. Pure Crushed Bones, all sizes, and other Fertilisers at market prices.

**NATIVE GUANO.**—BEST AND CHEAPEST MANURE FOR GARDEN USE. Price £3 10s. per ton, in bags. Lots under 10 cwt., 4s. per cwt.; 1 cwt. sample bag sent carriage paid to any station in England, on receipt of P. O. for 5s. Extracts from 20th Annual Collection of Reports:—

NATIVE GUANO FOR POTATOS, VEGETABLES, &c. B. LEE & SON, Market Gardeners, Burnham:—Used for three years for Vegetables, Strawberries, Cucumbers, Tomatoes, and other Market Garden Crops, and it has "given great satisfaction for all crops." T. BEASON, Gardener to Lord Windsor:—Used for several years for Potatos and general Kitchen Garden Crops. Results: "Good. A capital manure."

NATIVE GUANO FOR FRUIT, ROSES, TOMATOS, &c. O. STONARD, Gardener to Sir A. T. Watson, Reigate:—"I have used your Guano for five years, and can bear testimony to its great value for fruit growing." C. BOUSE, Nezeing Park Gardens, Waltham Cross:—Used for Tomatoes, Cucumbers, Chrysanthemums, and Roses. Results: "A marked improvement wherever used. A good and cheap manure."

Orders to the Native Guano Co., Ltd., 29, New Bridge Street, Blackfriars, London, where pamphlets of testimonials, &c., may be obtained. AGENTS WANTED.

**GISHURST COMPOUND**, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in leather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

**GISHURSTINE** keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

**PAINTER, GLAZIER.**—Practical man would undertake to put Private Gardens or Nursery in good condition. References to Stewards and Gardeners.—J., 12, Kerry Road, New Cross.

# GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH" ROLLING AND COLLECTING MACHINES FOR 1896.

The Winners of every Highest Prize in all cases of competition, and the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world.

HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,  
HIS ROYAL HIGHNESS THE PRINCE OF WALES,  
THE KING OF THE BELGIANS.

The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,  
And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

The Queen's Head Gardener, Mr. OWEN THOMAS, writing from the Royal Gardens, Windsor, to Messrs. GREEN on January 17, 1894, says:—"I have pleasure in saying that both at Chatsworth and at the Royal Gardens my men have constantly had your Lawn Mowers in use for many years—Horse, Pony, and Hand power—and one and all of these Machines have done first-class work, and given every satisfaction. Not only is the workmanship and material in your Machines the furthest important recommendation that they are of very light and easy draught." And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

Upwards of 220,000 of these Machines have been sold since they were first introduced in the year 1856. They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

**SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains, Wheels, and Handles.**

To cut 6 in., can be worked by } £1 15 0  
a Lady ... }  
To cut 8 in., do. do. } 2 10 0  
To cut 10 in., do. by a strong youth } 3 10 0  
To cut 12 in., do. by a man ... } 4 10 0  
To cut 14 in., do. do. ... } 5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

BEWARE OF DECEPTIVE IMITATIONS.

### DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man } £8 10 0  
on even lawn ... }  
To cut 18 inches, do. man and boy... } 7 10 0  
To cut 20 inches, do. do. ... } 8 0 0  
\*To cut 22 inches, can be worked by two men } £8 10 0  
\*To cut 24 inches, do. do. ... } 9 0 0  
\* If made stronger, suitable for Donkey, 30s. extra.

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side-delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Oig Harness:—

We have dispensed with the old-fashioned method of side delivery in these machines, so that they are thoroughly up to date.

### DONKEY AND PONY MACHINES.

To cut 26 inches ... .. £14 0 0  
To cut 28 inches ... .. 18 0 0  
To cut 30 inches ... .. 18 0 0  
Leather Boots for Donkey ... .. 1 0 0  
Leather Boots for Pony ... .. 1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

### HORSE MACHINES.

To cut 30 inches ... .. £22 0 0  
To cut 36 inches ... .. 28 0 0  
To cut 42 inches ... .. 30 0 0  
To cut 48 inches ... .. 34 0 0  
Leather Boots for Horse ... .. 1 9 0

### GREEN'S PATENT LAWN TENNIS COURT MARKER (No. 2412).

The Best Marker made.

1st size, with 3 wheels, 14s.  
Large size for Clubs and Large Grounds, price 17s.

Small Bag of Marking Composition, 9d.

### Green's Patent New Monarch LIGHT DRAUGHT LAWN MOWER.

It is superior to any Mower of this class yet brought out. Very suitable for Small Lawns and Banks.

TO CUT ... .. SIZES AND PRICES.  
To Cut ... .. 8 8 10 12 14 16 inches.  
Without Grass Box 30s. 35s. 40s. 50s. 60s. 70s. each.  
Grass Box extra ... 5s. 5s. 5s. 6s. 6d. 6s. 6d. ..  
If fitted with a Long Handle for cutting banks, &c., 5s. extra.  
No charge for packing-cases, except for shipment.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.

N.B.—Those who have Lawn Mowers which need repairing should send them either through their Ironmonger or Seedsman to our Leeds or London Establishment, or direct to us, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

GARDEN SEATS AND CHAIRS, AND HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c.

Descriptive Illustrated PRICE LISTS Free on application to  
**THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON;**  
or they can also be had of any respectable Ironmonger, Seedsman, Merchant, or Factor in the United Kingdom.

### GREEN'S PATENT Ordinary IRON and WATER-BALLAST ROLLERS

FOR

Lawns, Drives,  
Bowling Greens,  
Cricket Fields, and  
Gravel Paths.

PRICES OF	cwt. qr. lb.	Diam.	Length.	Reduced Prices
HAND ROLLERS.	2 1 0	16 in.	by 17 in.	£2 5 0
	3 0 0	20 in.	22 in.	3 0 0
	5 2 0	24 in.	26 in.	4 5 0
	8 2 0	28 in.	29 in.	5 10 0
	8 2 0	30 in.	32 in.	7 5 0

### GREEN'S IMPROVED WATER & SAND BALLAST ROLLERS.

IN TWO PARTS.

They can have the weight regulated to suit the requirements of the ground, and also have it increased up to 45% on the empty weight of the Rollers.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in Great Britain.

PRICES, INCLUD- ING WATER FUNNEL.	Weight—cwt. qr. lb.	Diam.	Length.	Reduced Prices
ING WATER FUNNEL.	2 1 14	18 in.	by 17 in.	£3 0 0
	3 1 0	20 in.	22 in.	4 0 0
	5 2 0	24 in.	26 in.	5 5 0
	8 2 0	28 in.	29 in.	7 0 0
	8 2 0	32 in.	33 in.	9 5 0

These Rollers possess many advantages over all others; they are made in two parts, and are free in revolving on the axle, which affords greater facility for turning, and the outer edges are rounded off or turned inwards, so that the unsightly mark left by other Rollers is avoided. They are manufactured of the best materials, bored true in the lath, turned on the inner edges, fitted on polished shaft, and are got up in a manner surpassing any hitherto brought out.

### GREEN'S IMPROVED PATENT GRASS EDGE CLIPPER. THE "HANDY."

The work it does is clean, neat, and effective, and we have every confidence in recommending this useful "Handy" implement.

It is fitted with long handle, works steadily and with ease.

Price, 30s.

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

### Summer Outings.

**H. CANNELL AND SONS** would be glad to have all intimations as soon as possible from Societies who contemplate visiting their establishments, so as to avoid two parties on the same day, and thus making satisfactory arrangements, and to be as interesting as possible to all. Our Nurseries are now, and will at all times be, one of the greatest sights in Horticulture. Our stock needs no exaggeration; we simply ask all to "Come and See," or send for Catalogues, post-free to intending customers.

SWANLEY, KENT.

Wednesday Next, April 15.

30 AZALEA MOLLIS, 100 A. INDICA, and 50 RHODODENDRONS from the Continent; 50 lots of STOVE and GREENHOUSE FERNS and PLANTS, HARDY BORDER PLANTS and BULBS, &c.

MESSRS. PROTHEROE AND MORRIS will sell the above by AUCTION, at their Central Sale Rooms, 87 and 88, Cheapside, London, E.C., on WEDNESDAY NEXT, April 15, at 12 o'clock. On view morning of Sale, and Catalogues had.

Friday Next, April 17.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. Hugh Low & Co. to sell by AUCTION, at their Central Sale Rooms, 87 and 88, Cheapside, E.C., on FRIDAY NEXT, April 17, at Half-past 12 o'clock precisely, an importation of CATTLEYA DOWIANA,

in the finest possible condition, plants being beautifully plump and leafy, with eyes quite dormant. This Gorgeous Cattleya has not been imported so far many years, and is extremely difficult to find in any quantity. At same time will be offered large importations of BURMESE DENDROBIUMS,

Chiefly formosum giganteum, nobile, and Wardiaaum giganteum Lowii.

SPECIALLY LOTTED TO SUIT LARGE BUYERS. Also a fine importation of LÆLIA ELEGANS, just received. On view morning of Sale, and Catalogues had.

Friday Next, April 17.

CYPRIPEDIUM VILLOSUM, CYP. new species, DENDROBIUM HILDEBRANDT, D. JAMESIANUM, VANDAS, &c., from Mr. J. W. Moore, of Bradford; 100 lots of ESTABLISHED ORCHIDS, and ORCHIDS from Mr. P. McArthur.

MESSRS. PROTHEROE AND MORRIS will include the above in their ORCHID SALE on FRIDAY NEXT, April 17, at half-past 12 o'clock. On view morning of Sale, and Catalogues had.

Friday Next, April 17.

(As fully advertised in the Gardeners' Chronicle of April 4.) Collected by Consul F. C. Lehmann, of Popayan, the well-known botanist and Orchid collector.

The contents of 25 cases of CATTLEYA TRIANELI, POPAYAN VARIETY. The grandest and richest in colour, and the widest in variation of any form of Cattleya labiata. The importation is in splendid condition, and may be said to be the first really successful one from the locality, the plants from which were rendered famous by the noble varieties which flowered out of the small lot gathered by Consul Lehmann in 1882.

Among the importations are several marked and described, white and other varieties, which are particularised in the catalogue from the letter of advice which may be seen at the Auction Rooms. The long journey and costly freight renders it improbable that an opportunity to purchase this fine Cattleya will occur again for some time, and buyers are earnestly requested to attend and inspect the plants for themselves. Also a few lots of ERIOPHIS RUTIDOBULBON, CATTLEYA SPECIES, with red bulbs and leaves of the texture of C. Lawrenceana and some other Orchids, together with 250 DISA ORANDEFLORA SUPERBUM, the finest brilliant scarlet greenhouse terrestrial Orchid, a few of the blue DISA LONGICORNU, &c.

MESSRS. PROTHEROE AND MORRIS will sell the above by AUCTION, at their Central Sale Rooms, 87 and 88, Cheapside, London, E.C., on FRIDAY NEXT, April 17, at half-past 12 o'clock. On view morning of Sale, and Catalogues had.

ICKWORTH PARK, BURY ST. EDMUNDS. CLEARANCE SALE OF STOVE, GREENHOUSE, and BEDDING PLANTS, GARDEN IMPLEMENTS, &c., by order of A. H. Wood, Esq., whose Lease of the Estate has expired.

MESSRS. PROTHEROE AND MORRIS are instructed to sell by AUCTION, on the Premises, Ickworth Park, Bury St. Edmunds, about 4 miles from Bury St. Edmunds Railway Station, on THURSDAY, April 23, at half-past 12 o'clock, the whole of the well-grown STOVE and GREENHOUSE PLANTS, also about 100 Orchids, 5000 Geraniums, 400 Fruiting Strawberries, about 100 lots of Garden Implements, 3 Mowing Machines, Lights, Frames, Tanks, Garden Engines, and numerous other items.

May be viewed day prior to the Sale. Catalogues may be had of Mr. H. COSTER, Head Gardener, on the Premises, and of the Auctioneers and Valuers, 67 and 88, Cheapside, London, E.C.

ORCHIDS! ORCHIDS!

## RICHARDS' NOTED PEAT.

(Trade supplied on best terms).

A large stock of the finest quality ORCHID PEAT. Also for Stove and Greenhouse Plants, Ferns, Rhododendrons, &c. By the sack, cubic yard, ten, or truck-load. Can be seen in bulk at London Wharf. Immediate despatch either from London or Grounds. By Rail or Steamer. Prompt and Special Quotations for delivery to any Station or Port.

O. H. RICHARDS, Old Shot Tower Wharf, Lambeth, London, S.E.; Peat Grounds and Depôts, Ringwood, Hamworthy, and Wareham. Address all letters to London Wharf.

## STANDEN'S MANURE.

ESTABLISHED OVER  
30 YEARS.

Exceeds all others in General Fertilising Properties and Staying Powers.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell. The highly-fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

**NATIVE GUANO FOR POTATOS, VEGETABLES, &c.**

B. LEE & SON, Market Gardeners, Burnham:—Used for three years for Vegetables, Strawberries, Cucumbers, Tomatos, and other Market Garden Crops, and it has "given great satisfaction for all crops." T. REASON, Gardener to Lord Windsor:—Used for several years for Potatos and general Kitchen Garden Crops. Results: "Good. A capital manure."

**NATIVE GUANO FOR FRUIT, ROSES, TOMATOS, &c.**

G. STONARD, Gardener to Sir A. T. Watson, Reigate:—"I have used your Guano for five years, and can bear testimony to its great value for fruit growing." C. ROUSE, Nazeing Park Gardens, Waltham Cross:—Used for Tomatos, Cucumbers, Chrysanthemums, and Roses. Results: "A marked improvement wherever used. A good and cheap manure."

Orders to the **NATIVE GUANO Co., Ltd.**, 29, New Bridge Street, Blackfriars, London, where pamphlets of testimonials, &c., may be obtained. AGENTS WANTED.

## MACMILLAN & CO.'S PUBLICATIONS.

### GREENHOUSE and WINDOW PLANTS.

A Primer for Amateurs. By CHARLES COLLINS.

Edited by J. WRIGHT, F.R.H.S. With 38 Illustrations. Pott 8vo. 1s.

*Nature News.*—"This little book of 154 pages is crammed with useful information for would-be growers of greenhouse and window plants. We hope Mr. Collins' little book will secure as large an amount of patronage as it certainly deserves."

### THE BOOK OF THE ROSE.

By the Rev. A. FOSTER-MELLIAR, M.A., Rector of Sproughton, Suffolk. Illustrated. Extra crown 8vo, 8s. 6d. net.

*Gardeners' Chronicle.*—"As the work of a sound and experienced practitioner, this will be received with acclamation."

*Journal of Horticulture.*—"A work of permanent value to be treasured and studied for the information that it contains."

### VEGETABLE CULTURE.

A Primer for Amateurs, Cottagers, and Allotment Holders.

By ALEXANDER DEAN, F.R.H.S. Edited by J. WRIGHT. With 38 Illustrations. Pott 8vo. 1s.

*Journal of Horticulture.*—"Vegetable Culture" is as thorough, concise, and instructive as either of the preceding Primers, and more than that need not be said."

### GARDEN FLOWERS and PLANTS. A

Primer for Amateurs. By J. WRIGHT, F.R.H.S.

With 50 Illustrations. Pott 8vo. 1s.

*Saturday Review.*—"There is no doubt that practically this little text-book will prove invaluable; the beginner will find in it exactly the information he must know, and generally does not, for the lack of a little telling. The cuts, too, are models of what such illustrations should be; they give the necessary information where words would be unconvincing."

### A PRIMER OF PRACTICAL HORTICULTURE.

Ten Lectures delivered for the Surrey County Council. By J. WRIGHT, F.R.H.S.

Pott 8vo. 1s.

*Rural World.*—"Clearly written by a man who knows what he is talking about."

**MACMILLAN & CO., Ltd., LONDON.**

## PETER LAWSON & SON, LIMITED, EDINBURGH.

Cassell's Saturday Journal says:—

### 'SOMETHING LIKE A VIOLET.'

"CALIFORNIA, its purity of colour, fragrance, grace of form, and large size, place it easily first of its species; in fact, make it rank as the most beautiful of all flowers. This new Violet has been in cultivation for three years, and now attained its most perfect form, colour, fragrance, and size. Each flower more than covers a silver dollar, and its stems are two inches long."

We have also to offer:—

PRINCESS OF WALES, awarded a Certificate of Merit, R.H.S.; and PRINCESS BEATRICE, 1s. each, 10s. per dozen.

**Cannell & Sons, Swanley.**

AND FOR ALL  
GLASS STRUCTURES  
THAT REQUIRE  
SHADING.

It combines efficiency with appearance, convenience with economy, and its effects are lasting, while it is easily removed when necessary with hot water. It can be supplied either pale green or grey.

TRADE MARK, No. 14,629.

The public are warned against spurious imitations which are offered them, through the success obtained for many years by Elliott's "Summer Cloud" Shading, and they should see that in ordering they get the "Summer Cloud," which is the only original and bona fide article, with the Trade Mark on each packet.

## TRUMPET DAFFODILS IN THE LANDES.

DURING a recent visit to Biarritz, I succeeded, not without difficulty and expense, in seeing *Narcissus maximus* growing in a spot in which it is probably indigenous. It is seven or eight years since we heard that this variety had been collected wild, and several hundred bulbs were distributed by a dealer in Biarritz, and found their way to England, but the place where they were collected continued a secret. About four years ago, whilst I was at Biarritz, an old woman appeared, whom I did not then see, with a large basketful of flowers of *N. maximus*. No one knew where she came from, or where she was gone to; but before I left for England I had succeeded in tracing her, but was prevented by bad weather from visiting the habitat of the bulbs. In that summer she sent me about 200 collected bulbs, which I planted at once, and they grew so rapidly that before winter they were more than 1 foot high and in bud, but the severe frosts which followed killed nearly all. These which survived proved to be the true variety *maximus* of a very fine strain. This year I was resolved to visit their native spot, but twice, about the first week in March, with a relation who resides at Bayonne, I searched the indicated neighbourhood, inquiring of every native we met. Some had never heard of such flowers, others directed us to double *Telemonius* in cultivated grounds; but as our guide had failed us, owing to wet weather, our search was fruitless. The third time we insisted that she should start with us from Bayonne station. The dreary district of the Landes consists of wet marshes and endless woods of Pinaster, with many low hills on which villages are built and vineyards cultivated. It is thinly populated, and has few attractions, except for shooters of wild fowl. Here and there woods of small cork Oak vary the prevailing Pine-woods, and there is besides a good extent of unplanted waste land. In this district our guide, who dealt in herbs, old china, Anemone flowers, and so on, told us she knew of four spots, several miles apart, in which these large single Daffodils grew. We could only visit one of them in a day, so selected the nearest to a railway station. It is a few miles from Dax, towards Pau. We obtained with difficulty and at a high charge, a small baker's cart, and still smaller pony, and four of us, closely packed, started under the old woman's guidance. We passed several vineyards in which the double scarlet *Anemone hortensis* was flowering in profusion. This is protected as a profitable flower, and as it carries well, is sent in large quantities to the towns. Single Daffodils seem to be held in no esteem either in

those parts or elsewhere in France, except amongst English visitors. Hence we saw Double Telemionius and Double Incomparable (Butter-and-Eggs), cultivated for their flowers in many of the peasants' vegetable grounds, but no single Daffodils. In one part we passed through a wood, entirely open to the road, and with very thin undergrowth, which was quite carpeted with the Daffodil, known as pallidus præcox, flowering unmolested. The common Primrose also grows in profusion by the roadside in many places. After driving five or six miles our guide stopped us, and led us up a woody hill, marching at such a pace in her wooden sabots, that we could hardly keep up. About half a mile from the road, we went through a hedge of Bramble and Smilax into a piece of rich pasture, where on a bank before us, perhaps 100 bulbs of *N. maximus* were growing thinly scattered about. The woman told us that she had found all the four places quite accidentally, and that the others were more nearly exhausted of their contents than this. I do not see any reason to doubt that the bulbs are native; the fact that they are not, and probably never have been, looked upon as valuable for their flowers, makes it unlikely that they were introduced, and the scattered way in which they grow makes them seem neglected. It is probable that closer search might discover many spots in this vast district where the same variety grows.

After looking into the botanical works of Loiseleur, De Candolle, Godron, and others, I find it so difficult to identify the varieties of Trumpet Daffodil which they describe as native in France, that I no longer attempt it. *N. major* is a term very loosely used by them, and would, perhaps, include *maximus*, even if any line can be drawn between these two varieties as at present known to dealers. I have had from different parts of the country near Bayonne several forms of *N. major*, some with the mouth of the trumpet partly recurved, so as to come near *maximus*; but I have never succeeded in finding any of them growing wild. The statements of the peasants who collect them are utterly unworthy of trust. I have heard that the wild parts of the Basque country near Hasparren contain these large self-yellow flowers, but I have little doubt that they might be found in parts of the Landes. One peculiar feature about all these lowland Daffodils in France is the uncertainty of their distribution. Here and there a wood may be found quite full of *N. pallidus præcox*, whilst twenty neighbouring and similar woods may be searched without seeing one.

The citron Hoop Petticoat should also be mentioned as a native of the Landes. On unreclaimed, wet, heathy land, not wooded, it is common from the Spanish frontier nearly to Bordeaux, becoming scarcer further from the coast, the eastern limit being, I believe, Bagnères de Bigorre. This is the extreme limit of the species in Europe. No other variety of *N. Bulbocodium* is found outside the Spanish Peninsula, except in North Africa. This citron-coloured *N. Bulbocodium* is still found in profusion close to the town of Biarritz, and in spite of the digging up of thousands for the English bulb market, seems still to flower in undiminished numbers.

I have remarked above that English writers on Narcissus have assigned limits to *N. major* which certainly were not intended by the French or Spanish botanists, and have suggested that the large self-yellow coming near *N. maximus* in form, is probably to be found in the Landes.

I have never seen anything like either major or maximus (as we now understand those names) from Spain or Portugal, all the trumpet Daffodils from those countries having distinct characters. Nor are the varieties mentioned known in any part of the Pyrenees as Mountain Daffodils. I have had from Northern Italy a form very like the *N. major* of English writers (*Bot. Mag.*, t. 51), but most of the self yellow Daffodils of Northern Italy are nearer the type known as *spurius*, and the prevalent large Daffodils of that country which Mr. Dammann, of Naples, distributes under several names, are two-coloured, like the princeps or single Telemionius of our bulb dealers. *C. Wolley Dod.*

## NEW OR NOTEWORTHY PLANTS.

### CEOLOGYNE RUMPHII, LINDL.

It is, I think, quite as interesting to re-discover a long-lost species as to find a new one, and in many cases more so. I was delighted, therefore, to get hold of what is evidently *Cœlogyne Rumphii*, Lindley, a species based on a drawing and description by Rumphius in the *Herbarium Amboinense*, vol. v., p. 106, t. xlviil. Lindley himself did not know the plant, and was enabled to describe it by extracting some notes from Rumphius, which are so written that his description is misleading. I had seen, some years ago, numerous dried specimens in the Buitenzorg Herbarium, and was surprised we had not got the plant in cultivation. After urging all the collectors I knew of who were visiting its home to seek for it, I received this year from Mr. Pereira, collector for Messrs. Sander, a plant which he had brought from Amboioa, somewhat suggestive of *Cœlogyne speciosa*, which, however, on flowering, proved to be new to me; and on comparing it with Rumphius' figure and description, I found that it evidently is the long-lost *Cœlogyne Rumphii*.

The pseudo-bulbs are oblong, more or less four-angled, about 4-inches in length, and about 1 inch through; but they vary a good deal in form, as they do in most of the species. The leaves are very large, being 1 foot or more in length, and about 5 inches across, obovate, rather stiff in texture, of a deep-green colour, with many strong nerves. The flower-spike arises out of a tuft of sheathing leaves close to a pseudo-bulb. It has a long wiry peduncle, longer than the terminal leaf which is borne by this shoot, i.e., about 6 inches long, and ending in few-flowered racemes. The flowers are large and pretty, and generally they open singly, but sometimes two of them open at one time. Unlike those of many other species of *Cœlogyne*, they last for a long time—for some weeks even in this damp and hot climate. The bud is wrapped in a lanceolate-acuminate green bract, which falls off before the flower opens. The sepals are  $1\frac{1}{2}$  inch in length, lanceolate-obtuse, and keeled, and of a pale green-apple colour; the petals narrow, linear, curved back so that their points meet behind the flower, and they are also of a pale-green colour. The lip is longer than the sepals, and pandurate in shape. The lateral lobes have short, curved points, and are beautifully mottled and spotted within with Indian-red, the spots showing through on the outside as a light-red reticulation. The terminal lobe is much broader transversely, oblong, emarginate, and pure white. On the disc between the lateral lobes, are the three usual keels, which are rather low, and truncately toothed, the edge being of the beautiful crimson colour that one sees on the lip of *Dendrobium cruentum*. The keels run on to the isthmus forming the base of the terminal lobe, and there are often noticed one or more additional short crests on the isthmus outside the longer ones; and in one flower I remarked these crests appeared on one side of the flower, but they were absent on the other. The crests on the lips of *Cœlogyne* are, however, often unequal in number and form, and in some species I have seen them differ in almost every flower. The column is stout,

with a large, almost entire hood, projecting far beyond the white conical anther. Its lower part is pale green, passing into orange on the hood, and on the face towards the lower part are many red streaks and spots.

The plant appears to me to be as nearly allied to *C. speciosum*, Lindley, as to any other, and is charming, and is likely to be popular with Orchid cultivators, flowering readily, whilst the flowers are both handsome and enduring. A stock will be ere long in the hands of the gardeners. It will be noticed that there are some slight discrepancies between this description and that of Rumphius; and the chief one is, that he describes the inside of the lip as "fusco variegata," but in the Dutch translation this is "bruin gespikkelt," which fairly well suits the plant. He also mentions that it looks like a flying hornet, but I must admit that the resemblance is remarkably obscure. In some respects the plant resembles *C. Micholitziana*, Kraozlin, *Xenia Orchid.*, iii., t. 256, which, however, appears to have a callus covering the whole disc of the lip, and no keels (a most unusual arrangement in *Cœlogyne*), and a very small bilobed hood to the column. *A. N. Ridley, Singapore, March 4, 1896.*

## ORCHID NOTES AND GLEANINGS.

### ORCHIDS AT W. VANNER'S, CHISLEHURST.

THIS collection is unique in the many rare varieties it now contains, and under the skilful cultivation of Mr. Robbins, the gardener, the plants are a very healthy lot. Amongst many that are in flower, and others that look very promising, are—*Brassavola glauca*, *Cattleya Trianaei* Robert Measures, *C. Vancneriana*, *C. Arnoldiana*, *C. Keinastiana* (very beautiful), *C. Prince of Wales*, *C. insignis Sanderi*, *C. maxima*, *C. Lawrenceana*, *Calanthe Regnierii*, *Cypripedium Lecoedi* (very chaste), *C. grande*, *C. Calypso*, *Oakwood* variety; *C. pulchellum*, their own hybrid; *C. creon superbum*, *C. Lathamianum*, *C. Chamberlainianum*, one epike has been in flower for sixteen months; *C. Measuresianum*, *C. politum*, and a very distinct variety of *Cypripedium montanum* type, one out of an importation of Mr. Sander's, the whole of the flowers spotted with purple, with a deep band of white round the dorsal sepal, and a very pale pouch. There were to be remarked plants in bloom of *Cymbidium chameo-Lowianum*, *Dendrobium luteolum*, *D. velutinum*, *D. nobile nobiliss.*, true, flowering freely; *D. Wardianum* and *crassinode* in profusion, and the pretty *D. Dominicanum*; *D. Cooksoni*; *Dendrochilum glumaceum*, very fine; *Lælio-Cattleya Fowleri*; the beautiful *Odontoglossum Arthurianum*, which received a First-class Certificate at a recent meeting of the Royal Horticultural Society; *Odontoglossum Andersonianum* with branching spikes; a very fine *O. Humeanum*; *O. Wilckeianum*, a very special variety; *O. luteo-superbum*, *O. ramosissimum*, *O. Uro-Skinneri*, *O. gloriosum*, *O. Rossi majus* in fine types, *O. Roezlii*, and *O. R. album*; the curious *Restrepia elegans* (Karsten); *Oncidium Marshallianum*; *Phaius Cooksoni* and *P. Marthæ*. *Masdevallias* are just coming into flower, including, amongst others, *M. Heathii*, *M. Schroderiana*, *M. Bull's-hood*; and the brilliant *Sophronites grandiflora*, flowering very freely. *John Carrill.*

### THE OLD DOUBLE WHITE CHINESE PRIMROSE.

IT is a matter of surprise that in few private establishments are seen any of the old double white *Primula*. Its decorative usefulness as a plant, and its capacity to produce abundance of flowers, useful for button-holes, &c., should be sufficient to recommend it. It is thought by some who have not been successful in their cultivation of the plant, that it is difficult of management, its propagation being especially troublesome. Like everything else, however, when properly understood, these obstacles are easily overcome. In March the old plants should be moulded up

with decomposed leaf-soil and sand, Cocoa-nut fibre or powdered charcoal, in order to encourage new roots before the plants are divided up. At the end of April or early in May, I pull all my old plants to pieces, and in doing so take care to preserve as many fibrous roots with the healthiest young growths as I can. They are then placed in small and large 60-sized pots, according to the strength of the offsets. The soil used for potting consists of finely-sifted loam, leaf-soil, and sand. The plants are potted firmly, and they are then placed in a cold frame facing south. Here they are plunged in Cocoa-nut fibre; but had I a propagating-case in an intermediate-house, this would be preferable. They are then given a watering through a fine rose, and kept close, being shaded from the sun, and lightly belowed

during the summer months in the brightest part of the day, say from 10 o'clock to 3.30. Close the frame at nights, and if the weather is cold, cover with mats. By the middle of September, the plants should be taken into the greenhouse, and placed on a shelf or light position near the glass, and early in November the successful grower will be well repaid for the little extra attention bestowed upon them by seeing good specimen-plants full of flower, which they will continue to produce until April. Nothing is better as a stimulant than a little weak soot-water, given them once a week, when the pots have become full of roots; it assists them greatly. That the above cultivation suits the requirements of the plant I think is proved by the specimen which has been sent to the Editor along with this article. I had a

monumental work, *The Silva of North America*, we learn that the species usually grows on dry, gravelly uplands, but sometimes in rich alluvial soil along river bottoms, &c. It is apparently confined in a wild state to the Southern United States, and is found most abundantly, and attains the largest size in the region west of the Mississippi River. It grows to a height of 40 or 50 feet, with a trunk rarely 2 feet in diameter. The wood is hard, compact, and unwedgable, and is employed for hubs of wheels, &c. There are three nice specimens in the Kew Arboretum, one of which is not much below 30 feet in height. *Geo. Nicholson, Royal Gardens, Kew.*

### HOPETOUN HOUSE.

THE princely residence of the Earl of Hopetoun is charmingly situated on the Firth of Forth, 5 miles west from Dalmeny, and about a dozen west from Edinburgh. The beauty of the route thither is enhanced by the undulating woods of Dalmeny Park, the seat of the Earl of Rosebery, while on the other side of the Forth the eye catches a glimpse of the stately mansion of Lord Elgin. It appears that the delightful district through which we pass is the ancestral home of three of the most distinguished contemporary Scottish noblemen, and this forms not the least interesting of the reflections by which we beguile our two hours' journey along the Queensferry Road. At Dalmeny we suddenly came in full view of the Forth Bridge. The old ferry, associated with the name of so remote a personage as Queen Margaret, has given place to the most marvellous of modern bridges, which, in three bounds, spans the mile and a half of water between the north and south shores of the Forth. Passing through South Queensferry, which contrasts in its quaint old-world aspect with the modern giant of steel and masonry overlooking it, we soon come in sight of a noble gateway, flanked by a chain of massive pillars, and premonitory of the elegance and splendour of the architecture of Hopetoun House. A stately avenue, which opens out into a broad park, brings us face to face with one of the finest mansions in Scotland.

The gardens are charmingly situated on the two slopes of a gentle glade, through which meanders a small stream. Staying for a little to take a general survey from the top of the north slope, the eye is drawn to a very fine collection of Cedars, Abies, Scotch Firs, and other trees, which form a suitable background to the smooth lawn stretching in front of a row of Peach-houses. This collection of Coniferous trees is otherwise remarkable as containing one of the original *Pseudotsuga Douglasi* imported into this country. Beyond this grove the eye catches a fine glimpse of the deer park, with Midhope Tower, the remains of a mansion of great antiquity, crowning the summit of the rising ground. Groups of stately Oaks and Beeches further diversify the view.

Turning now to inspect the houses, a range of six vineries, each 42 feet long, is entered, the Vines consisting of Black Hamburgh, Muscat of Alexandria, Lady Down's Seedling, &c. The Muscat-house was being cleared of the Vines in order to be renewed with Muscat of Alexandria. The earliest Hamburgh-house was started, and gave a promise of a fine crop. Several specimens of the Guava, *Psidium Cattleyanum*. This unexpected meeting with an old friend, to be followed later by similar surprises, is explained by the fact that the Earl of Hopetoun was, during the past six years, the popular Governor of Victoria. Not the least valuable of the trophies brought or sent home by his Lordship and Lady Hopetoun are several rare specimens of Australian trees and plants, which now form a special feature of Hopetoun gardens. Before leaving this range, we noted the last bloom of a large collection of Chrysanthemums, besides a capital lot of Azaleas and other spring-flowering plants.

The next range is devoted to the culture of Peaches, Nectarines, and Figs, which bore an excellent crop last year. The promise for this season, to judge from those already started, is reassuring. The same signs of tidiness and neatness are apparent here, and

FIG. 65.—THE WIAHOO, OR WINGED ELM: *ULMUS ALATA*.

over-head with the syringe each bright morning. In about a month most of them should be making roots, and consequently a little air is given them to prevent them becoming drawn. The plants must be carefully watched in order that no damping of the foliage may occur, or the plant may succumb. All decaying foliage must be promptly removed, and a little powdered charcoal applied where the union is broken. At the end of June or early in July they should be moved into the pots in which they will flower; the strongest plants will require 5½ or 6-inch pots, and the smaller ones 4½ inch. Use fairly rich but light material, as given before, with the addition of a little fine peat, soot and bone-meal. Place them back in a frame facing south, and give them close attention in the matters of airing and watering; the latter must never be done unless the plants really require it. They will require a light shading of tiffany or hexagon netting

batch of sixty plants, most of them as well flowered. *J. Mayne, Bicton.* [The plant received from our correspondent was an excellent one, large in size; it was remarkable no less for its abundant healthy foliage than for the very uncommon wealth of flowers it possessed. Ed.]

### THE WIAHOO, OR WINGED ELM.

*ULMUS ALATA*, the subject of the present note, was, according to Loudon, introduced to this country in 1820. It is, however, far from common, although the species, either in its summer garb or in its leafless winter condition, is decidedly attractive. In winter, of course, the extraordinary development of cork on its branches is most conspicuous. The neat habit, and the Hornbeam-like leaves, render the plant a desirable one for planting as a single specimen on a lawn. From Professor C. S. Sargent's

the large variety of spring-flowering plants with which the range is also ornamented, is equally thriving and effective.

We next inspect a greenhouse filled with a fine lot of useful flowering specimens. Another contains a remarkably good collection of Carnations, worthy of remark both on account of their vigour and size. The stove is beautifully arranged with *Dracenas*, *Crotons*, *Pandanus*, variegated *Ferns*, *Anthuriums*, and a charming collection of stove climbers festoon the roof and sides. The Palm-stove is furnished with magnificent specimens of *Kentia*, *Phoenix*, *Erica*, &c., and includes some rare varieties of Australian *Ferns*, *Orchids*, &c. The contents of the forcing-house—*Daffodils*, *Lily of the Valley*, *Azaleas*, *Hyacinths*, *Freesias*, *Cinerarias*, *Cyclamens*—are equally indicative of intelligent management and successful culture. A range of frames, which next absorbed attention, contains many hundreds of Strawberries in pots, *Chrysanthemums*, &c., all in the best condition. A lean-to house, containing *Stephanotis floribunda*; and in one of the sections a large collection of *Pelargoniums* well deserved the time spent in it. The inspection closed with a stroll through the conservatory, with its effective assortment of Palms, *Ferns*, *Acacias*, *Richardias*, *Azaleas*, &c., and including two very fine specimens of the Staghorn Fern.

The inspection of the gardens was completed by a pleasant saunter over the lawns of the flower-garden, arranged in designs which must make the spot both attractive and effective in the summer season. The vegetable garden adjoining is replete with large collections of the hardier fruit trees, the excellence of whose quality has become a proverb. The walls afford shelter for Peaches, Plums, Pears, and other fine kinds.

From the gardens we passed into the park to inspect its many venerable sylvan treasures, and to admire at frequent intervals some delightful vista through the trees. Hopetoun is famous for its Cedars, and we did not go far before becoming aware of the fact. There in a glade, not far from the house, stand two hoary specimens which excite our admiration for the space of a quarter of an hour. One of them is stricken by decay; but the other, at the age of 300 years, has attained a height of 90 feet, and is 22 feet in girth. Here are a few statistics which will reveal more than a description, but which can hardly be called exceptional here. A *Picea Morinda*, grafted on the Norway Spruce in 1826, was 10 feet high in 1837, and now measures between 80 and 90 feet. A grand Beech is 112 feet in height, and 14½ feet in girth, yet you might find scores that might almost venture to dispute his pre-eminence. An Oak 103 feet high, and 11 feet 10 inches in diameter is hardly, you insist, entitled to take rank as the superior of his many peers. The views through these groups on sea, hill, and dale on the Forth and the Ochils, and Stirling Castle, with the furrowed brow of a rugged Ben afar off, are glorious, even in the dense atmosphere of a winter day.

The Pinetum affords a study of a large variety of Pines, &c., in fair condition. *Pinus Cembra*, *Cedrus atlantica*, *Pattoniana*, *Cryptomeria*, *Pinus Lambertiana*, *Tsuga nobilis*, *Tsuga Mertensiana*, *Abies Nordmanniana*, *Sequoia gigantea*, *Pinus Koraiensis*, *Thuya*, *Cupressus*, &c. A rocky in the middle contains some interesting specimens, found in the neighbourhood. Thence we continue our stroll into the lower deer park, which flanks the winding shore of the Forth, and which is overlooked by Lord Hope's walk—a charming promenade, with a far reaching view.

Hard by is the former site of Abercorn Castle, which lends a title to the Duke of that name, whose broad acres contrast with the circumscribed spot from which the titular dukedom is derived. By this time we are nearing the house, admiring the magnificent lawn that slopes away from the west front into the woody vista beyond, and stopping to take a look at several promising Cedars planted by royal visitors to Hopetoun, including the Shah, the kings of Saxony and Denmark, the Prince and Princess of Wales, &c. *Edina*.

## FOREIGN CORRESPONDENCE.

### RHODODENDRON EXIMIUM AND OTHERS.

Will you kindly allow me a little space in your paper to clear up a doubt as to *Rhododendron eximium*? The discoverer of the plant—Nuttall—gives in the *Journal of Botany* for 1853 an exact description of the plant, but had not seen the flowers. My plant, which flowered for the first time in 1889, had rose-coloured flowers, twenty-six corollas (twelve to eighteen, Nuttall), and fourteen stamens. The habit was exactly like that of *R. Falconeri*, but the leaves were more woolly on the under-side; and the colour of the corolla blush-coloured. I believe it to be a rose-coloured variety of *R. Falconeri*. Last year I saw in an exhibition a plant under the name of *R. eximium* with woolly leaves and rather white flowers. Would some of your learned correspondents kindly express an opinion concerning this matter? There are here about 100 heads of flower of *R. Aucklandi* now opening. A plant of *R. niveum* has just flowered, the colour being, however, of a much deeper shade of lilac than the plant figured in Curtis's *Botanical Magazine*, and the corymbs having about thirty flowers. *R. campylocarpum* is very much like the figure in Hooker's *Sikkim Rhododendrons*; and Delaney's *R. decorum* is just opening five heads. Last, although not least, the red *R. argenteum*, a small grafted plant, is flowering with two large trusses. Is this to be considered as a variety of *argenteum* or as a species? *O. P., Lehenhof, Austria.*

### ASTERS AND ZINNIAS FOR BEDDING.

GREAT improvements have been made in Asters during recent years, and many distinct and beautiful strains may now be obtained; but to have the plants in perfection, good cultivation is needed. The treatment they sometimes receive—that of being planted in small patches amongst hungry herbaceous plants, does not meet their requirements, or afford much idea of their beauty. In the flower-gardens proper they have not taken a leading place, although I have seen them, together with other half-hardy annuals, making a gorgeous display when extensively used as substitutes for *Pelargoniums*, &c., killed during a severe winter. They appear to me, however, to be best seen when planted in isolated beds, more especially when standard *Fuchsias* or similar subjects are thickly dispersed amongst them to break the somewhat even surface of the heads of bloom.

Some of the best varieties for bedding purposes are *Victoria*, which grows from 1½ to 2 feet in height, and which may be purchased in at least twelve distinct colours; three of the most beautiful and which harmonise pleasingly, being light blue, white, and rosy-carmine. *Emperor* and *Veitch's Bedding* are equally beautiful, free-flowering varieties, growing compactly, and measuring about 1 foot in height; while *Dwarf German* and *Dwarf Bouquet*, which are 8 inches in height, are excellent subjects for forming edgings to beds of taller Asters, or to borders of miscellaneous plants.

There need be but little difficulty in raising a stock of Asters, and for this reason, and because they have not to be wintered under glass like most kinds of bedding-plants, they are valuable to those persons who possess small gardens and few appliances. The first half of the month of April is a suitable time for sowing the seeds of these plants, and no place is better than a mild hot-bed (one that has done service for raising early Brussels Sprouts and Cauliflowers), and for this purpose a layer, 3 inches thick, of finely-sifted light soil should be placed on the bed, and the seeds sown in shallow drills drawn 3 inches apart. The frame should be kept close, and shaded till the plants come up, which will be in about ten days, after which time air should be admitted more or less freely on favourable occasions, and increased as the season advances. Mats or similar protectors should be used on the lights on cold nights. As soon as four rough leaves have developed, the plants must be pricked-out in frames, and if a thin layer of old Mushroom-dung,

covered with 2 inches of light soil, be spread on the bed, the plants will come away with good balls when lifted for planting in their summer quarters. At this stage, attention to watering and hardening are the chief requirements; the lights being left off entirely towards the end of the month of May, excepting in cold or very wet weather. Early in June the plants should be hardy and robust, and in fit condition for planting out.

As has been intimated, the Aster requires liberal treatment; their beds should therefore be deeply dug, and well enriched with decayed manure, and when planted upon poor soil, light sprinklings of nitrate of soda, applied in showery weather, form an excellent fertiliser for them, and greatly increase the vigour of the plants and size of the flowers.

*Zinnias* are remarkable for the beauty of the colours of the flowers, some of the crimson and yellow varieties being especially brilliant. Like the foregoing, *Zinnias* are well adapted for planting in isolated beds, but choice should be made of sunny situations, the *Zinnia* flowering more profusely in full sunshine. Generally the cultural details given for Asters apply to these plants, but as they make very rapid growth when young, the seed should not be sown before the last week in April. The double varieties are very popular, although the single ones are probably the more vivid in colour. Large double-flowering varieties, which grow about 2½ feet in height, are excellent for planting in large beds; and dwarf Pompon and double-flowered dwarf varieties, and *Z. Haagiana imbricata*, possessing very bright yellow flowers, are effective in small beds. *Thos. Coomber.*

### TREES AND SHRUBS.

#### MAGNOLIA CONSPICUA.

THIS, the Yulan, or Chinese White Magnolia, is now (March 28) an object of great beauty on the terrace of Gunnersbury House, Acton. It is a very fine specimen, and, I should think, quite 30 feet in height, and regular in growth; the spot in which it is growing is naturally well drained, because the ground near falls away abruptly to the ornamental water, which is on a considerably lower level; but the position, though sheltered on the east, is yet open to frost and west winds. Large as the specimen is, it is very prolific of its large, fragrant, white, tulip-shaped flowers, and if they are cut when about two-thirds developed, and placed in water in a room, they will open out and expand their petals until they become almost horizontal, while they retain their pleasant fragrance. It is not to be wondered at that Mr. Hudson always looks with great pride upon the fine example of this Magnolia, but not unmixed with concern, for frosts tear the snowy petals, and blustering winds rend them, until much of their beauty is defaced. *R. D.*

#### SPIREA THUNBERGI.

THIS Japanese species is the first of the long list of *Spiraeas* whose flowers add so much to the attractiveness and interest of our gardens from the end of March right up to October. It is a dwarf plant, distinct enough to be easily recognised amongst the somewhat embarrassing crowd of *Spiraeas* now in cultivation. It is not often seen more than 3 or 4 feet high, the twigs being thin and wiry, and the leaves small and linear-lanceolate. The flowers are pure white, and although individually small, are produced in such abundance as to transform the twigs into slender arching sprays of snowy blossom. Like most of the *Spiraeas*, it requires a rich, moist soil, and prefers a position fully exposed to the sun. It can be readily increased by means of cuttings put in during the late summer. *H. J. B.*

#### FOSYTHIA SUSPENSÆ.

THE most beautiful hardy flowering shrub of March is undoubtedly this Chinese plant. Nothing can be finer than the glorious cloud of yellow blossom that it carries now in such a graceful way on long thong-like branches. Whether planted as an isolated mass on a lawn, or rambling in an unpruned way over an arbour or against a wall, it is most effective. The only place in which it does not show to advantage is

in the too common mixed shrubby, starved and uncared-for, where it can only, by an effort, thrust its slender shoots above the crowd. Such treatment of a shrub such as this is disgraceful. Last week has seen it in its fullest beauty, and at Kew it was displayed in a variety of ways. It gives a yellow glow to the Director's office, one of the lodges is partially draped with it, and in several instances one sees it as an isolated mass on the lawns, sweeping the turf with its flower-laden shoots, and in one instance half a dozen bushes of it rise from a brilliant blue carpet of *Chionodoxa sardensis*, which is seen hundreds of yards away.

While speaking of *F. suspensa*, I should like to elicit information from any readers as to whether there is any real distinction between the Forsythia named in catalogues as *F. Fortunei*, as I have not

flowers. Highly interesting as well as beautiful is *F. intermedia*, which seems to be a genuine cross between *F. suspensa* and *F. viridissima*, as it possesses intermediate characters in growth and flower, being more erect and stouter in branch than *F. suspensa*. I know nothing of its origin, but it is by no means common, as I have only seen it in the Kew collection. W. Goldring.

SEQUIOIA GIGANTEA PENDULA.

Certainly one of the most curious of all Conifers is the subject of the present note. It cannot be described as ornamental, at least when of large size, though young specimens are sufficiently curious and distinct to warrant more than a passing notice. In Mr. Lane's nursery at Berkhamsted there is a specimen fully 20 feet high, and a number of others

PLANT NOTES.

STERNBERGIA FISCHERIANA.

Flowers and foliage of this species of Amaryllid, whose bright yellow flowers are about 2 inches across when expanded, come from Mr. C. G. Van Tubergen, Jun., of Zwanenberg, Haarlem, Holland, who says of it:—"This pretty plant, which was introduced by me from Armenia, is much hardier than *Sternbergia lutea*, from which it also differs by producing its flowers and its foliage in the spring-time. It is a nice addition to the stock of spring-flowering bulbs, being a perfectly hardy plant, bright in colour, and distinct in appearance."

DO WILD BIRDS NEED PROTECTION?

DOUBTLESS, those readers of the *Gardeners' Chronicle* who are students of natural history, have perused with something akin to amusement that portion of Mr. Leach's contribution on bird protection in the issue of January 18, where he describes kingfishers as being destroyed by the score in a certain locality during severe weather. Since my bird-nesting days these birds must have radically changed their habits to assemble in such numbers; and my experience gained, by-the-by, in the very locality from which your correspondent writes, was that so far from being gregarious, kingfishers like magpies are not gregarious, but they are met with singly or at most in couples. Still, the fact of their existing in such numbers as inferred by him precludes their immediate extinction, and from personal observation I believe that the kingfishers have considerably increased during the last twenty years. The advertisements culled by Mr. Leach are, doubtless, from the *Bazaar, Exchange and Mart*, the only paper in which birds are advertised systematically, consequently the process of extinction is more superficial than real. From an educational point of view nothing can excel a well-filled case of the rarer species well mounted in positions resembling those occurring in Nature, affording object-lessons to students which no verbal description or well-executed print could convey.

Many will agree with Mr. Leach as to the desirability of imparting a knowledge and love of bird and plant life, in our schools, particularly in town schools; but the most practical method of doing this is, however, a question not readily answered. Only a few weeks since an advertisement appeared in the *Gardeners' Chronicle* for an instructor in botany for one of the South London schools (evening classes). I enclose for your inspection the form to be filled in by applicants for the appointment, which commences, you will observe, at the munificent pay of half-a-crown per night. Little wonder if (apart from the smallness of the pay, which is such that an ordinary labourer would refuse to accept) our school teaching proves abortive, when a teacher is expected to have his erarium filled with the multitudinous subjects mentioned therein, and in which the successful applicant apart from botany, is apparently expected to be proficient. Many of the rarer species of birds are either denizens of a warmer or colder climate than our own, as the case may be, or being birds of passage only spend their time with us when the close season is in force. The laws at present existing should, if properly and impartially administered—which they are not—amplify most the exigencies of the case. The superabundance of our Acts of Parliament introduced by faddists offer excellent subjects to foreigners inclined to criticise and ridicule English manners and customs. In France, every owner of land, however limited in extent it may be, is a "sportsman," and harmless useful little birds are butchered in a manner unknown here. Since gun-licences came into force, almost all our wild birds have materially increased, and only to instance larks and plovers, which exist in prodigious numbers in many parts of the country, particularly the eastern counties and along the south coast. There is, therefore, no sound reason why they should not form part of our food supply in the

FIG. 67.—SENECIO MULTIFLORUS SEEDLINGS. (SEE P. 460.)

yet been able to satisfy myself on the point. I recently asked a nurseryman if there was a difference. "Oh, yes," said he, "*F. Fortunei* is a much more robust grower;" but I have not been able to mark the difference. Sir Joseph Hooker once thought that there was a difference between individuals of *F. suspensa* in the relative length of the style, some flowers being pin-eyed, others thrum-eyed. Mr. Hemsley does not even mention *F. Fortunei* in his *Synopsis of the China Flora*, so I think it must be only a garden name, and if so, it should be suppressed in catalogues, as it leads the unwary to purchase what probably they already have.

*F. viridissima*, though without the elegance of *suspensa*, is nevertheless a beautiful shrub, quite worthy of a place, even when *F. suspensa* is in the same garden. It is of more erect growth, and has rather larger, and sometimes a more plentiful crop of

from 5 to 6 feet high. As seen from a distance against the sky-line the old tree has a very singular appearance, the long, pendulous, and irregularly produced branches imparting an outline such as one rarely sees, unless associated with an isolated specimen that has for long been stranded on an exposed mountain side. Young trees are far more shapely and pleasing in outline, and though they cannot be described as ornamental, yet they are so very distinct, that their presence in the park or garden is quite desirable. In all the specimens I examined, the branches sprang out directly at right angles to the main stem for a distance of about 3 inches, then turn abruptly downwards parallel to and close to the stem for in many instances a space of 4 feet. The foliage is quite normal, and one of the cones I picked off was 1½ inch long, by fully 1 inch wide, and placed on a branch-like footstalk hardly three-quarters of an inch long. A. D. Webster.

same manner as partridges, pheasants, wild ducks, &c., to the killing of which Mr. Leach makes no objection. Again, many species of birds, on account of their immense numbers, have to be treated as vermin, and kept under by the gun or otherwise, or in some localities it would be impossible to obtain any fruit worth mentioning.

The absence of insectivorous birds in the immediate neighbourhood of London is principally caused by cockney sportsmen, who assemble in numbers, particularly on a Sunday, on nearly all open waste lands within easy distance of town, and blaze away at any and everything clad in feathers, in oblivion of the fact that a law exists against this wanton destruction, which, however, is never enforced—the penalty being, I believe, £1 for firing off a gun on the Sabbath. The scarcity of birds of the genus *Turdus*, for instance, is the principal reason why plants of the Cabbage family are so difficult to keep clean and bring to perfection during the summer months, owing to the swarms of caterpillars which infest them at that season. Thousands of useful birds are annually destroyed by these gunners, which would, were they spared, really prove a benefit to the whole community. S. S.

### THE TRADE IN SIAMESE TEAK.

For a long time past the use of Teak has been increasing in Europe, the well-known strength and durability of the wood recommending it for a number of useful purposes. It is interesting, therefore, to have some facts from Her Majesty's *chargé d'affaires* at Bangkok, on the condition of the Teak trade and forests in Siam. Mr. de Bussen says, according to the Customs' figures, that Teak was exported in 1894 to the extent of nearly double the value of the figures for 1893. In 1894 the quantity exported amounted to 57,719 tons, valued at £160,000, and the figures for 1895, it was calculated, would far exceed these. Large sums continue to be invested in renewing leases of forests, and acquiring new leases. The number of logs now floating down annually to the duty-station of Cheinat, on the Menam, 100 miles above Bangkok, is about 72,000. Up to three years ago the number was only 45,000 or 50,000, falling in the floating season of 1891-92 as low as 12,000.

Taking only regular shipments in vessels of European build, the following are the best statistics obtainable:—In 1894, 37,090 tons were exported, as compared with 24,550 tons in 1893; the values being respectively £113,657, and £88,464. In the last two years Bombay has taken a greater quantity of Siamese Teak than England, but the quality is very inferior, representing the surplus of the saw-mills after all the best Teak they can produce has been shipped to Europe. In bulk, however, the figures stand as follows:—In 1893 England took 5700 tons, and Bombay 8400 tons. In 1894 England took 13,000 tons, and Bombay 15,000 tons, or according to one estimate as much as 17,000 tons. Hong-Kong takes 6000 or 7000 tons annually, and Singapore about 2000 tons. A demand is growing in Saigon for Siamese Teak, 390 tons of which went there in 1894. A French Government Commission is now negotiating for the purchase of 1300 tons in Bangkok for shipment to the Toulon dockyards, *via* Saigon. It seems, therefore, that France does not share the prejudice of the British Admiralty against Teak from Siam, much of which grows on the same hills as the highly-prized Maulmeiu Teak, being floated down in one direction or the other according to the water-shed.

Various opinions are entertained as to the extent of the deforestation which is being caused by the growing exports of Teak from Siam. The Siamese forests, however, are said to have suffered less than those of the Burmese Shan States, having, indeed, been worked a much shorter time. Provisions for replanting are contained in the new form of forest lease introduced last year, but they are irksome and inefficacious, and the Siamese Government is now endeavouring to secure the services of an Indian forest officer of experience to advise them upon the whole question of forest management.

## FORESTRY.

### HEDGE-ROW TIMBER.

THE prevalence of hedge-row timber is a most characteristic feature of an English landscape, and gives it, when viewed from a commanding position, the appearance of a continuous forest. This class of timber owes its origin to various causes, and among them, planting is perhaps the least common. The most probable cause of its existence is to be found in the condition and treatment of farm hedges in the south of England. Left to grow pretty much as they like for a number of years in succession, they form narrow thickets, beneath which seeds of all indigenous plants find refuge. In this way they act as nurseries for the more common trees and shrubs, the seeds of which are carried by birds or the wind from neighbouring trees. The most common of our hedge-row trees, the Elm, requires no agencies of this kind to distribute it, as the suckers thrown up from the root soon form a young colony round the parent tree, which, as a rule, grow straighter and faster than seedling plants would do. When these hedges are eventually cut down, which may occur once in ten years, or when they become too thin and bare at the bottom to prove efficient fences, many of these seedlings and suckers are left standing, for no other reason, probably, than that instinctive respect for a young tree which lurks in the rustic mind as well as elsewhere, but which respect, we regret to say, is not always paid to it in its after life.

The advantages of hedge-row timber from an æsthetic point of view are manifold, but the agriculturist looks at them from a different standpoint. To the breeder and feeder of live stock, hedge-row timber is probably more beneficial than hurtful, affording as it does shelter from strong sun, and cold and driving rain, and few stockowners care to be entirely without it. But to the cultivator of arable land, hedge-row trees are an undoubted nuisance, by preventing crops from ripening evenly, robbing the soil, and blocking the drains with their roots. In arable districts, therefore, such trees should be reduced in number as far as possible, and in any case it is worth considering whether they might not be judiciously replaced by small clumps, whenever these can be placed out of the reach of cattle, or without interfering with cultivation—for a tree in a hedge intended to act as a fence is as much out of place as a bull in a china-shop, and it is impossible to get really good hedges under the shade of trees. Few things look worse than those combinations of trees, thorns, posts, and rails, dead and living Brambles, barb wire and sheep-hurdles, which represent hedges in a thickly-timbered country, and few things more futile than an attempt to keep cattle between them for any length of time; but on most farms there are patches of ground in the corners of fields which, with very little additional fencing, might be utilised for the growth of ornamental or useful trees without interfering in any way with the legitimate use of the ground, or the growth of the hedges. A tree which seems especially suitable for places of this kind is the false Acacia (*Robinia Pseudo-Acacia*), whose merits have been more appreciated on the Continent than with us. Its ornamental character has made it particularly popular as a wayside tree, and county and district councils might, when they have finished their foot-paths, do worse than plant a few of these trees along them for shade to the traveller in the heat of summer. As a farmer's tree it has no equal, for when grown closely, it quickly produces useful poles, and no timber is more durable when used as a fencing-post. It succeeds well on light sandy soils, reproduces itself freely from suckers, and its prickly shoots render it an excellent hedge-plant. Alder, Willow, Poplar, &c., are also useful trees for planting up odd corners about the farm which are too wet for ordinary cultivation, while Hazel might be grown on drier spots; in fact many, if not all, of those commonly occurring waste corners, which usually act as weed seed-depôts on a farm, might be profitably planted up without going to any appreciable expense in so doing. A. C. Forbes.

## BOOK NOTICE.

LE CHRYSANTHÈME À LA GRANDE FLEUR. Par Anatole Cordonnier. (Published by the author, Bailleul, Nord, France.)

WE have frequently considered it to be a somewhat remarkable circumstance that while here in England we have had a large number of cultural treatises published on the Chrysanthemum, in France, where so much has been done to improve the flower, its literature has in a large measure been almost neglected. There are, it is true, a few French authors who have written upon the subject, but viewed from the exhibitor's standpoint, the new work which is now under notice is the only one worthy of the name of a book. Mr. Cordonnier is an able and enthusiastic cultivator of the famous flower from the far East, he thoroughly understands its cultivation, has practised it with success, and now, like the English champion, Mr. Edwin Molyneux, gives the public the benefit of his long experience in all its details.

Unlike many horticultural writers, Mr. Cordonnier does not confine himself to a dry technical method of imparting his information, but here and there lapses into pleasant chatty moods, and more particularly so, perhaps, in the early part of his book. But he does not allow his pen to run away with him, for the first part of *Le Chrysanthème à la Grande Fleur*, occupying more than half the entire work, takes the reader through a vast amount of practical work, in which propagation by cuttings, by seed, composts and manures, bud-selection, re-potting, waterings, and many other matters are fully dealt with in their turn. The second part is devoted to select lists of the best varieties suitable for producing big show blooms—a mode of cultivation not understood in France until recent years, but one very ably demonstrated by the author in 1887, on the occasion of his Fête des Fleurs at Roubaix. Since then other growers, notably Mr. Ernest Calvat, have shown French Chrysanthemum fanciers the potentiality of the flower, and it is safe to affirm that this style of cultivation is now better understood and more widely practised in that country than ever. In the concluding portion of the book Mr. Cordonnier travels over much ground, interesting to French grower and English alike. Among the subjects are the Chrysanthemum in England and in France, new varieties, foreign shows, floral committees, &c.

Considering that the book has been written for continental readers, it is not within our province to criticise the cultural matter, because in no plant do climatic influences play a greater part in ultimate success or failure than in the Chrysanthemum. As a literary production, Mr. Cordonnier's work may be pronounced a distinct success, for it is got up in good style, is neatly and clearly printed, is well illustrated, both in the text and with inserted plates, and is comprehensive in its scope. The price at which it is published, two francs, is very moderate, and should ensure a large sale to the author. The book is dedicated to Mr. Harman Payne, the Foreign Secretary of our National Chrysanthemum Society.

### FARMERS AND FRUIT CULTURE.

THE improved system of fruit-growing adopted by individual growers is, I dare say, most countries where fruit-growing is promising, might be made to serve as examples to be inspected by neighbouring farmers under the lead of suitable persons. The permission for inspection would doubtless be readily obtainable, and if it be done twice between July and early in October, in relation to earlier and later sorts respectively, the ocular demonstration of size and quantity produced would go further than any theoretical teaching, some points of which might be enlarged on *in situ*.

Acres to be selected for the most favourable results in fruit-growing should, for Apples, have a south-west aspect by preference, or as near thereto as practicable, a gentle slope being best of all, with natural shelter to some extent. An owner would soon have proof of the difference between an older orchard with

perchance a northern slope, and the results in a few years of the selection of acres as indicated.

The proof would be promptly apparent that it was worth while to sacrifice other crops to these requirements in order to insure a first-rate Apple-crop, which in such situations would even result in such years as 1879, when, for instance, Lord Suffield Apple did well, although Beetroot grown alongside of it was a failure.

The bountiful advice tendered for the attainment of success has not, so far as I have seen, touched with sufficient emphasis on the system of planting pyramids and bush Apple trees in the most obvious way. There is so much clay to contend with in these parts and elsewhere, that the very idea of

in the issue of February 1, should not deprecate it as he does, for he appears to exaggerate the labour of removal of every other tree to fresh acres when growth will have become too close. Nor would the accident of Celery requiring earthing-up in September be the right time to root-prune, the most valuable portion of a crop having yet to hang for another month. Also the removal of soil from under fruit trees for earthing-up Celery seems too rough and ready a method. If "W. P. R." would adopt the proper plan of root-pruning for each tree to be removed, about the end of October, one year before the transplanting operation, there would be no loss of crop at all to speak of, provided he sees the removal of each tree to fresh quarters done very

to secure regular crops of a strictly limited assortment, so as to enable the grower by careful grading of quantities of a variety on which, along with packing in boxes or cases, instead of bushel-baskets, so much depends the matter of price, as was ably insisted upon by Mr. Monro in his remarks in your issue of January 25. Of course, some trees may even then require to be occasionally root-pruned later on, and some varieties more than others, for the principle of root-pruning is too well recognised as of a first importance to be ever again neglected by the fruit-grower.

The style of planting recommended, and forming mounds, would include the placing of the trees on ground previously slightly shaped to that inclination, and for the roots to descend from a slightly-raised centre; the completion of the mounds, in covering the roots, to result in a difference of, say, 12 to 18 inches between the base of the stem and the lowest point between it and the nearest trees.

This style of planting will enable the postponement of draining the ground, which may be considered when crops meet the expense if it be at all required. Another item is the saving of manure, which will under the described favourable conditions be almost absolute (except in very dry years with a good crop growing), as a mulching, or on very poor soil.

Economy in the pruning of the trees is also a matter for consideration, the best preventative of too free growth being a full crop of fruit. Varieties like Lord Suffield, that never fail except, perhaps, through frost destroying the bloom, prune themselves so thoroughly that the pruning-knife is hardly ever wanted. "A. D.," who so well says what a pity that Mr. Monro's remarkable papers should not be read by every grower, might have his own contributions to your paper with advantage placed alongside of Mr. Monro's to stir up the slumberers. When farmers have recognised, as they appear to be now doing, that for quality of dairy produce they must needs compete with the foreigner on the basis of improved methods abroad, they may be hoped to realise that fruit culture and delivery in the best marketable form is only another link in the chain of their various pursuits that make up the elements of average success, any one of which the farmer neglects at his peril.

Pears, of course, in bush and pyramid form, would be grown similarly; and if there be the advantage of a good old wall of southerly aspect, let Peaches and Nectarines, as a safe crop, be added, one tree between each pair of piers, planting the choicest of the late varieties of Pears, trained gridiron fashion, one on each pier only.

Other contributions to your paper are constantly repeating the best selections of sorts and varieties for all purposes, so there is no need to enlarge on this subject. *R., Forest Hill.*

## CULTURAL MEMORANDA.

### GARDENIAS.

Those plants which have been raised this spring should be encouraged by warmth and moisture to make strong healthy growth, taking out the points of the shoots twice at the least, so as to induce bushy, well-furnished heads. Cuttings may still be struck, which will give fairly good plants for flowering next spring. It is well to remember that the more the shoots are stopped, the more numerous the flowers and the smaller their size, so do not stop a plant more than thrice in one season. A good kind of soil for Gardenias when grown in pots, consists of peat, sand, a small quantity of finely-broken charcoal, and fibry loam, nothing being sifted before use. *W. Markham.*

### FREESIA REFRACTA ALBA.

I have found the following method of culture very successful during several years, and having procured a good strain, I find it an advantage to propagate one's own stock, as most of the imported bulbs are not so satisfactory, either in regard to the colour of the flowers, or time at which they may be expected

FIG. 68.—COMMON CINERARIA SEEDLINGS. (SEE P. 460.)

"digging a hole" in which to plant a tree is the contrary of what is necessary in connection with clay and success. Certainly, trench the ground deeply where possible, and placing, where clay is near, your trees on the trenched or dug surface, and covering the roots with the top-spit, well chopped up, taken from between the tree-sites, transforming the acres into gentle undulations, so that every tree shall grow on the top of a small mound. The lighter the soil, the less does this become a requirement, although in all cases the effect of sunshine on the slopes round each tree, striking the mound's surface as nearly as it can be made a right angle, will have a great influence in promoting the growth of roots, and consequently on the crop.

Planting closely to start with is an economical principle, which "A. D.," in your paper of January 25, is right in maintaining; while "W. P. R., Preston,"

expeditiously, gives each fair root severed a clean cut with a sharp knife, in order to induce fibrous root growth. By thus producing at home what he cannot thus favourably buy, well-prepared trees with the least possible injury to crop prospects, he removes a serious drawback to which he alludes.

A more comprehensive view should be taken of the selection of the site on the lines of a manufacturer in starting with a plant to be gradually quadrupled in the most economical way by adapting his first instalment to the final limit. Fruit growers do likewise! and choose, say, 5 acres to plant first, the remaining 15 acres to be added after the original plan of the whole site, as best adapted for his acres. The removal of half the number of trees to adjoining acres will be a mere trifle in relation to this "making of the tree" transferred for good, as is well pointed out by "A. D.;" and thus for twenty years and more

to bloom. To obtain flowers in January, I pot up a batch of bulbs in July, and when doing so use the following compost: two parts fibrous loam, one part leaf-soil, a little powdered cow-manure, and a liberal sprinkling of sharp sand. Seven to nine bulbs, according to size, are placed in a 5-inch pot, and it is regarded as essential that the bulbs be kept well under the soil. If the soil be at all dry, they are thoroughly watered, and then placed in a spot where they may be protected from heavy rains. A slight covering of cocoa-nut fibre or other material is put over them to prevent evaporation, and when the growths are seen above the soil, they are removed to frames and kept fully exposed in order to get them strong and as hardy as possible. About the end of September they are put on a shelf in a greenhouse as close as possible to the glass. A temperature of 50° will be as much as they require. As soon as the flower-spikes appear, it is an advantage to give them a little fire-heat; and when the weather is favourable, an abundance of air. Feeding by means of some kind of fertiliser and clear foot-water should be commenced as soon as the pots are well filled with roots. Light and frequent applications are much better than larger doses. Stake them early to prevent any from damage by bending them over just above the surface of the soil. When the flowering period is past, return them to the shelves, and give them a liberal treatment with plenty of manure-water until the foliage begins to ripen and become brown, when the amount of water given should be gradually reduced, until the stems have died quite down, when they may be stored away in their pots, and kept free from drip until potting-time again. Freesias, like other bulbs and corms, should not be kept very long in a dry state, or they very much deteriorate, and blooms of a weak quality are the result. *A. Hurst.*

## VEGETABLES AND VEGETARIANS.

ANYTHING that will be of assistance to the market-gardener at home is worth consideration in these columns, and in all other journals really "racy of the soil." Mr. Glenny, market gardener, of Barking, has been insisting that keepers of vegetarian (and other) restaurants in London—and the number of the former is increasing—do not make sufficient use of the heaps of wholesome toothsome fruits and vegetables brought to market for the benefit of the purchaser and consumer, and the profit of the producer. The restaurant-keeper does not come to market sufficiently early; but somebody else must if the good parcels disappear before the City buyer comes on the market-place. So it comes to pass that oatmeal, peas-pudding, maize flour, lentils, &c., made up in many disguises, figure on the menu; whilst fresh vegetables, fruits in season, easily procurable at low rates—see our market reports—are ignored, because it seems the buyer is not up with the sun, and so early on the mart. Mr. Glenny specially notes the absence of mealy Potatoes from the table of the vegetarian's dining saloon. *Certes*, they are now, and long have been, wonderfully cheap; and it has too often been a pitiful sight, the carting home again from, say, Spitalfields Market of high-class green stuff—lacking buyers, and this in face of the fact that not half enough vegetables are consumed in families, for often their preparation is "over much of a bother." Complaint is made of the market salesman that he does not care to take charge of small parcels for disposal on commission. Mr. Glenny is of opinion that they are not in favour of putting on their stands, say, ten dozen bunches of Parsley, or Sage, Mint, Marjoram, or Thyme, of early Radishes, spring Onions, &c.; but we know that this does not hold good everywhere, for we could point to men who are not above selling the quantities recorded, but even much less. And we have been told that a fairly good trade is done in forwarding to the suburbs—well, on the way back to the market gardens!—1-cwt. and 2-cwt. sacks of nice mealy Potatoes, the aid of Carter, Paterson & Co. and of other carriers being called in at a cheap rate. Of course, if "the fruit that

grows at the root" can be so easily and cheaply distributed from the London market centres, so also can many other things—the "Stores" people know all about this, and profit by the knowledge. On the whole, much as the spread of vegetarian produce has done for the public health and the market-gardener, it would be easy to do more by the increased demand for fresh vegetables day by day. But, however much may be done in this way, it is doubtful if more could not be done by increasing the number of markets, both "formal" and "informal;" and here the County Council should step in, for in attending to this sort of business they would certainly relieve the streets of the metropolis of much of the traffic which now so loudly calls for street-widening and which entails enormous charges on the rates. Mr. Glenny and market gardeners might do worse than turn their attention to this aspect of the question of vegetarianism!

## THE WEEK'S WORK.

### THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Clinton, Tring.

**MISCELLANEOUS WORK.**—Arrangements for the planting of the flower-beds during the ensuing season should be completed. In most instances a fair idea may now be formed as to the number of plants that will be required, and when this is known, by looking through the various plants already propagated, it will be seen in which cases special efforts must be made to obtain the requisite number. *Lobelia* and *Pyrethrum* may be grown in sufficient quantities to make good the losses among other kinds of edging plants, the former being quickly grown, and capable of affording a display of colour in a short time, and the latter being comparatively hardy, will need little care after the plants have been pricked out into boxes or frames. A little seed might even yet be sown in some sheltered spot out-of-doors, for plants from late-sown seed very frequently are useful for odd beds, generally left until last. Flower-beds that have been unoccupied during the winter and spring months may now be planted, with various hardy edging and other plants that are used for the summer bedding, such as *Cerastium*, *Herniaria*, *Sedums*, *Pansies* and *Violas*, dwarf *Antirrhinums*, *Antennaria*, *Lysimachia*, &c. This will leave the frames now occupied by them available for other things.

**HARDENING THE PLANTS.**—Preparations should be made for hardening-off bedding *Pelargoniums*, *Verbenas*, *Marguerites*, and other plants. If ordinary frames cannot be had, some means should be provided by erecting rough-made wooden or galvanised iron shelters, over which mats or dressed canvas sheeting may be placed during rough or inclement weather. Turfpits are frequently made up for the same purpose, and the plants sufficiently protected by the use of odd lights and other coverings. Those who fortunately possess plenty of frame-room will be spared this extra trouble.

**CUTTINGS** of tender kinds of bedding plants may still be put in, and rooted cuttings be potted off. Canas that have commenced to make growth may now be divided and potted up. Afterwards place them in a warm house for a few days until root-action is commenced. Pot *Abutilons*, *Ricinus*, *Solanums*, *Eucalyptus*, and other sub-tropical bedding plants, so that they may be of good size before being hardened off. Cuttings of zonal *Pelargoniums* now being propagated should be inserted singly in thumb-pots, and when they have rooted let them be potted on into 2½-inch pots. Bedding *Begonia* should be kept growing in moderately warm pit or frame for another fortnight or three weeks, after which more air may be given. Seedlings should be pricked off as soon as they are large enough to handle, and be kept in a warm house or frame over a hot-bed.

**SOWING ANNUALS, ETC.**—Many kinds of annuals may now be sown in the open borders, and those intended for the production of flowers for cuttings should be sown in patches if possible. These are *Mignonette*, *Virginia Stocks*, *Candytuft*, *Scabious*, *Sweet Sultan*, ornamental grasses, *Coreopsis*, *Eschscholtzias*, *Larkspurs*, *Lupins*, *Bartonia aurea*, *Cornflowers*, *Godotias*, *Double Clarkia*, *Gypsophila*, annual *Chrysanthemums*, *Everlastings*, *Sweet Peas*, *Sunflowers*, &c. Most of these are best sown in shallow drills, at a distance apart, varying according to the growth of each variety. Cover the seed lightly with

fine-sifted soil, and if the soil that is drawn out of the drill be left, it will afford some slight protection to the young plants. *Asters*, *Stocks*, *Zinnias*, &c. that have been raised in frames should be pricked-off as soon as they can be handled, using a light rich compost, in which the plants will root freely.

**GLADIOLUS.**—The borders, having been prepared as advised in a former Calendar, these may now be planted about 3 to 4 inches deep, and about 1 foot apart. Place a handful of sand at the base of each corm, which serves not only as a medium for the roots, but keeps the base of the corm drier, and largely prevents rot. Stake the plants as soon as they are sufficiently high, and mulch the border with half-rotted manure.

### PLANTS UNDER GLASS.

By JNO. MCINTYRE, Gardener, Woodside, Darlington.

**IXORAS AND EUPHORBIAS.**—Where there is convenience, I would recommend a good quantity of *Ixoras* to be grown for winter blooming. My system of culture is as follows: Each year, at about this season, we strike two or three dozen cuttings. Only three or four varieties, as *Pilgrimi*, *sanguinea*, and *Prince of Orange*, are grown. *Pilgrimi* is the freest bloomer, I would, therefore, advise a larger quantity of this variety. Cuttings taken now and grown on through the summer, and repotted into 4 or 5-inch pots at the end of July, will make excellent plants. Pinch the shoots while young, so that the plants may be bushy and dwarf. A few good trusses of bloom may be got from each plant the same season. If late bloom is wanted, it is much better to keep only tolerably young plants; with the exception of half-a-dozen specimens, none of our plants are kept more than three years. A compost of good peat and silver-sand is one in which they do best. A good batch of cuttings of *Euphorbia Jacquineiflora* should now be struck and rapidly grown on to supply bloom during the winter. Use 3-inch pots filled with silver-sand, and insert several cuttings in each. They will soon root if given bottom-heat, and they should then be potted singly into thumbs, and shifted again as soon as they have filled the pots with roots.

**GREENHOUSE RHODODENDRONS** being of slow growth, attempts are made by some growers to hasten the plants by keeping them in heat. Such is not the case, however, and in most cases it leads to the plants becoming unhealthy. A cool greenhouse is the proper place to grow them successfully. Immediately the plants have done flowering, those requiring a shift should be re-potted. If the plants are healthy, these pots may be a size or even two sizes larger than the present ones, and the roots are so very fine that they are easily injured if an attempt is made to reduce the balls. Use two parts good peat (as used for *Ericas*), one part loam and coarse clean silver-sand. Make the soil very firm, and for a short time keep them a little warmer, but the atmosphere should not be dry. Much care is necessary in watering for some time until the roots push into the new soil. Spraying with the syringe twice a day is more beneficial to the plants than root waterings at this stage of growth. Specimens planted out in rockwork, along with tree *Ferns* and *Camellias*, grow very well and bloom freely.

**THE STOVE** should be carefully ventilated by day when the outside conditions are favourable, neglect to do so resulting in weak growth. The first started batch of *Gloxinias*, if coming into flower, should be removed to a cooler house, particularly if they are going to be used in room decoration later. Others may be repotted and grown on under general conditions of warmth and moisture. *Achimenes* if grown in pots, will need in most cases, some kind of support for their stems, but those in baskets look best when allowed to hang over the edge of the baskets, putting supports only to those stems that are situated in the middle. Weak liquid does much good to *Achimenes* during the season of flowering.

**HIPPEASTRUMS.**—These bulbs which are showing for flower, may have assistance from some artificial manures, I prefer Clay's, in the amount of one teaspoonful to each flower-pot. Any bulbs that have finished flowering, should be kept growing so long as the foliage shows no sign of maturing, except in the case of those bulbs which are almost evergreen, and these should have the quantity of water reduced after a reasonable time has been allowed for growth to be made. Bulbs in flower will be better if they are removed to the conservatory or other cool house, shading them from the sun so long as the flowers remain on them.

## THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Burton-on-Trent.*

If the work has been pushed forward, according to recommendations in previous Calendars, there will not be much stress at the present time. It is very important that the protection of opening blossoms should have first attention, though it is not necessary or advisable to apply a covering, except when frost is probable, or there are cold winds and rain. The advantage in the use of curtains over fish-netting for the protection of fruit-buds upon trees on walls is now very apparent. Where the former is used, the trees, when ready for disbudding, are easy of access, but in the case of the latter it is difficult to move about between the trees and the netting. Peaches and Nectarines will now be sufficiently advanced in growth to require attention in the matter of disbudding. It is better to take away any surplus growths while very young, at which time they part easily from the branches; while if left longer, a sharp knife will be required to remove them, in order to prevent injury to the bark, which may result in gumming. If the trees have filled their allotted space, the points of the leading shoots should be pinched out at the third leaf, and all the young shoots emanating from the fruiting wood, with the exception of two at the base, should be rubbed off. Effect the work gradually by going over the trees several times at intervals of two or three days, removing a few shoots each time. If the tree is well furnished with wood, only one of the two shoots left will be required, and that one should be chosen which is in the best position for laying in, to take the place of the one now fruiting. In the case of younger trees, more shoots will require to be left for the extension of the trees, and these should be trained in at about 15 inches apart, sufficient lateral shoots being left to cover the intervening space between the main branches when nailed in at about 4 inches distance from each other. When the fruits are well set, commence to thin them by first removing all those which are badly placed, and afterwards remove those that do not appear to be swelling up so freely as some others. Where there are two fruits together, take away the smaller and worse placed one, gradually reducing the number of fruits until only a few more are left than will be required for a good crop; and as some of the fruits may fail to stone properly, sufficient should be left to allow for any loss that may take place from that cause.

## THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Lurford, Dorking.*

**CATASETUM, MORMODES, AND CYCNOCHES.**—For some unaccountable reason these species have for a long time been greatly neglected, but they are now gaining in favour with specialists and amateurs. There were some species which were more neglected than others because they were ear-marked as being nothing more than botanical curiosities, and having therefore no use as cut flowers; while *Catasetum tabulare*, *C. Bungeodtii* and its several beautifully distinct forms, *Cycnoches chlorochilon*, *C. pentadactylon*, *Mormodes Hookeri*, *M. Rolfei*, *M. pardinum*, *M. lunatum*, *M. l. eburneum* and its spotted varieties which have a decorative value, some of which have very fragrant flowers, are much grown. It is remarked that these species and varieties do not possess the vigour usual to them in their native country, and the chief cause of this loss of vigour is usually traceable to the insufficient maturation of the pseudo-bulbs. Many of these species are commencing to grow, and they should be shaken out of the old compost, have dead roots and decayed parts cut away, which will allow of each pseudo-bulb being freed from all mealy-bug and scale. *Mormodes* and *Cycnoches* may be grown with success in pots or shallow pans, but baskets of teak are more satisfactory than either for the *Catasetums*. Afford plenty of drainage, and press the materials together with moderate firmness. The compost should consist of equal parts of peat and sphagnum-moss for the robust species, and chopped sphagnum-moss, with a moderate quantity of small crocks mixed with it, for those of weaker growth. The *Mormodes* should be placed at the warmest part of the Cattleya-house; while the other species, which thrive best in stronger heat with a large amount of sunshine, should be suspended near the roof of the East-Indian or Dendrobium-house. A good deal of care in affording water is necessary till the plants have become re-established; and when in full growth

water should be copiously supplied to them, providing the materials get quickly dry.

**EULOPHIA AND CYRTOPODIUM.**—Other Orchids which are making new growth are species of deciduous *Eulophia*, *Lissochilus*, and *Cyrtopodium*, and should any of these require more root-space, the present is a good time to disturb the roots. Pot them in the compost recommended for *Calanthes*, and as soon as new roots push from the base of the young growth, place the plants in the warmest house in a light position. As with *Catasetums*, &c., so with these as regards affording water.

**PERISTERIAS.**—Plants of *P. elati* and *P. Lindenii* starting to grow should be placed in a house a few degrees warmer than the one they are now standing in, and receive generous treatment.

**ANGULOAS.**—The various *Anguloas*, as *A. Ruckerii*, *A. Clowesii*, *A. eburnea*, and *A. uniflora*, will now be throwing up their flower-spikes and young breaks, and should be stood in the warmer, shadier part of the intermediate-house. No re-potting should be done in the case of these species before the flowers are cut and roots emerge from the young growths. For the present, afford sufficient water to keep the materials slightly moist.

## THE KITCHEN GARDEN.

By C. HERRIN, *Gardener, Deepmore, Maidenhall.*

**THE MAIN CROP OF CARROTS.**—The ground for this important crop should have been autumn-trenched, and left rough all through the winter. It should now be stirred with a fork or hoe, and broken down; and if of a dry and light nature, it should be trampled evenly all over, and a good dressing of soot and wood-ashes applied. Having then raked the land, drills about half an inch deep, and 12 inches asunder, should be drawn, and the seeds thinly sown therein. Fill-in the drills with the feet, then roll the bed with a wooden roller, and once more rake it over in a line with the drills. When roots are required for show purposes, and the land will not grow such, holes 15 inches deep, made with a dibber, may be filled with finely-sifted sandy loam and a small quantity of soot and wood-ashes, pressing it down firmly, and sowing three or four seeds on each. For general consumption the so-called intermediate varieties are the best; and where the soil is of no great depth the short or stump-rooted varieties only should be grown, such as *Early Nantes* and *Scarlet Model*, and others of that class.

**ASPARAGUS.**—The plants raised from seeds sown last year will be fit for planting when the shoots are about 6 inches high. New plantations may therefore be made within a week or two of the present time, enough land being planted to meet all the requirements of the establishment for forcing and cutting in the open. For beds to last a number of years, flat planting is preferable, as raised beds entail much labour, with no advantages worth consideration; the land having been prepared some months ago, should be caught when in a workable state, and drills drawn at 18 inches apart. The plants should be planted in these drills at 18 inches apart in alternating fashion. An alley 2½ to 3 feet wide should be allowed between every three rows for convenience in gathering the crop, clearing, &c. Where blanched heads of large size are required, 3 feet space may be given between the rows, but in a general way the lesser distance suffices. When planting shallow drills should be drawn to mark the lines, but a sloping trench should be chopped out with a spade on both sides, deep enough that when the edge that is left is levelled down for setting the plant upon, the crown shall be slightly elevated, and about 3 inches under the surface. In planting, spread out the roots, cover with fine soil, making it moderately firm with the hand, and give each a small stake before finally covering in, to which the growth should be loosely tied when high enough. If holes are dug out for each plant, these should be of an uniform depth, and large enough to hold the roots without cramping them, which should slope downwards somewhat from the crown to their extremities. Plants which are intended to be forced should have the crowns planted from 12 to 15 inches apart each way, and be treated in all respects like those in the permanent beds. The heads of *Asparagus* which have pushed through will need protection from frost, for which purpose some litter may be scattered over them; or if they are liked in a blanched state, some light soil may be used instead.

**POTATOS.**—The planting of the sets may be carried on till the end of the month, the late varie-

ties being the first planted, and the earliest left till the last. To secure a change of seed it is good practice to plant a few rows for seed purposes in the field, to be used in the garden the following year. Medium-sized whole sets about 3 ounces in weight should be chosen in preference to cut tubers. Small sets yield a relatively poor crop, and should not be used. If the soil is light, the sets may be planted in holes made with a dibber; otherwise drills should be drawn about 5 inches in depth, and the sets laid in them 12 inches apart. Charred earth is valuable for scattering over the sets before covering-in. Strong-growing varieties need 2½ to 3 feet space between the rows, but for Ashleaf varieties and others of moderate growth 2 feet is sufficient space. If Brassicas are to be planted between the rows of the latter, a 3-foot space should be afforded.

## FRUITS UNDER GLASS.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

**THE EARLIEST PEACHES AND NECTARINES.**—When by the rapid swelling of the fruit it is seen that the stoning period is past, the night temperature may with safety be raised to 65°, shutting up the houses early in the afternoon with sunheat. Continue to syringe the trees twice a day till the fruits begin to ripen, when it should be discontinued. The early varieties, *Waterloo*, *Alexander*, and some others, should be carefully watched in this respect, the fruits ripening off very quickly. If the least trace of red-spider be remarked, apply an insecticide forthwith, it being a very important point of practice to have the foliage quite clean before the syringing is stayed for a time. Water should be copiously afforded at this stage, sometimes using warm weak liquid-manure to the borders, but in the case of young trees growing too vigorously, water only should be afforded. Young trees may be cropped more heavily than trees which are aged and in good bearing, and such cropping will tend to check too exuberant growth. Attend to the tying-in of shoots, and remove leaves or draw them aside from the fruits when the former obstruct the light.

**SUCCESSION-HOUSES.**—Trees whose fruits are about to form the stone should be guarded against any sudden check to growth as might occur from draughts of cold air during the day, or a too high temperature at night. For the present a warmth of 55° to 60° at night, and from 65° to 75° in the daytime, and a few degrees higher by sun-heat, will suffice. Should mildew show itself, flowers-of-sulphur should be used against it, the hot-water pipes being also painted with whitewash in which sulphur is mixed. Spraying with Killaright is also effective against mildew. Against aphides, the trees should be lightly fumigated on two or three consecutive nights. When mildew is remarked on the leaves, more air and less atmospheric moisture should be afforded. Trees that were started in February and whose fruits are swelling freely will require constant attention in regard to disbudding, but not removing any great quantity of shoots at a time. For directions regarding this operation I refer my readers to earlier calendars. The thinning of the fruits should also be proceeded with. Let the afternoon syringing be done when the house is closed, and early enough for the foliage to get dry, or nearly so, before nightfall. On rainy or dull days afternoon syringing may be dispensed with. Trees in bloom should be afforded an abundance of air on all favourable occasions, and in mild weather ventilate them slightly at night. If blossoms are very abundant, it will be advisable to thin them, particularly those upon the undersides of shoots. The blossoms set pretty freely at this part of the season, if the branches be tapped daily, or the bees have access to the house. If the late houses are heated, it is an advantage during cold and sunless weather to apply heat, affording a small amount of ventilation at the top of the house, but not raising the temperature above 45° at night, and 50° to 55° by day.

**NITRATE OF SODA.**—At the Balloon Society meeting, held on Tuesday, March 31, a paper was read by Mr. ARTHUR ROBERTSON, of Mining Lane, on "The Origin, History and Uses of Nitrate of Soda." Discussion followed, and the opinion expressed was that the annual export from Chili of 1,300,000 tons would be largely increased as agriculturists awoke to the advantages derived from its use. Mr. ROBERTSON contended that the general public do not know of its usefulness in the cultivation of vegetables, flowers and fruits.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

**Letters for Publication,** as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

**Illustrations.**—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

**Local News.**—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

## APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, APRIL 11—Royal Botanic Society meet.

SUNDAY, APRIL 12—Brussels Orchidéenne show.

TUESDAY, APRIL 14 { Brighton New Horticultural Society show.  
Royal Botanical Society Daffodil conference and exhibition (two days).

WEDNESDAY, APRIL 15 { Durham, Northumberland, and Newcastle Botanical and Horticultural Society show (two days).

THURSDAY, APRIL 16—Linnean Society meet.

## SALES.

MONDAY, APRIL 13 { Azaleas, Greenhouse Ferns and Plants, Hardy Plants, &c., at Protheroe & Morris' Rooms.

TUESDAY, APRIL 14 { Imported and Established Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY, APRIL 15 { Palms, Palm Seeds, Tuberoses, Begonias, Acers, at Protheroe & Morris' Rooms.

FRIDAY, APRIL 17 { Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—48°.

WHILST the origin of the garden Cineraria is still a moot point, it is of interest to collect information concerning the allied species, and to put on record the characteristics of those specimens which come nearest to the cultivated forms. From this point of view we are glad to be able to lay before our readers the following communication from Mr. R. I. LYNCH, the Curator of the Cambridge Botanic Garden, who has also obliged us with the specimens from which the accompanying illustrations (figs. 67—69) were taken:—

*Senecio multiflorus*, D.C.—For the re-introduction of this handsome species we are indebted to Mr. WALTER GARDINER, F.R.S., who presented seeds to the Cambridge Botanic Garden after visiting the Canaries about two years ago. They were gathered in Gran Canaria, near Monte de los Laureles, in the direction of S. Brigida and S. Mateo, which lie to the south-west. The character of the plant is well shown by the accompanying plate (fig. 69), which has been prepared from specimens growing in the Cambridge Botanic Garden. On the left is shown the habit of a young plant just commencing to flower, and producing lateral branches, which, later, grow up, and form a lax mass of inflorescence about 3 feet or more

across. A typical inflorescence, which might be that of a branch, is shown in the centre of the plate, and considering the spread of the ray-florets, bright lilac in colour, with a darker disk, it can be understood that the plant is highly effective, though not precisely from a florist's point of view. Without doubt, however, the plant may readily lend itself to valuable results in hybridising. Our stock was raised from seed sown in May last, and the first flowers were open shortly before Christmas. This species is, perhaps, the most robust of its immediate allies, and is cultivated with even greater facility than the garden Cineraria, the treatment for which suits it precisely. It easily reaches a height of 6 feet, and might be considered rather too tall, but herein it has an elegance of its own which would not be improved by dwarfing. No doubt it can be dwarfed, and with advantage from certain points of view, but only with sacrifice of a certain fine character it now possesses. The young seedlings, which we also illustrate (see fig. 67, p. 455), are remarkable for thickness of stem, especially in comparison with the garden Cineraria, which in this stage is practically stemless, with leaf bases closely approximated (fig. 68). In our plant the nodes are distant, and the stem, by storing up reserve material, appears to feel a special responsibility in providing for possible needs of the future. This characteristic is evident almost as soon as stem forms, and becomes very conspicuous when the plants are perhaps 1½ inches high, as thick as a pencil, and nearly blunt at the apex. The plant is evidently perennial in about the same degree as the garden Cineraria, and from young shoots appearing at the base, can be propagated from cuttings in the same way. We have had flowers for more than three months, and a succession will last for several weeks longer, no doubt. If the tops of some plants are cut off before they flower, shoots are produced from below, which rather extend the flowering season.

The identity of this plant is quite clear. In the Lindley Herbarium, now the property of the University, I find a specimen of precisely the same form labelled *Doronicum Bourgei*. This led me to a figure under the same name in the *Bot. Mag.*, vol. lxxxiii, (1857), t. 4994, which affords a striking portrayal of its features. Returning to specimens, it seemed quite clear that *Doronicum Bourgei* was nothing more than the older *Doronicum Webbii*, having been established on quite insufficient grounds. To Mr. BURKILL, the Assistant-Curator of the Herbarium, I was then indebted for referring me to Dr. CHRIST'S *Spicilegium canariense* in ENGLER'S *Botanische Jahrbücher*, vol. ix., p. 147, where the reduction is actually made, following BOLLE in *Bonplandia* (April 15, 1860, p. 133), who adopts *Pericallis* for the genus. Dr. CHRIST, writing in 1857, naturally uses the correct genus *Senecio*, but he keeps the specific name *Webbii*, and gives *Senecio multiflorus*, D.C., as a synonym. This clearly was wrong, since the latter name was perfectly correct, and already published in the *Prodr. Fl. Kew.* At Kew, this plant was first supposed to be new, but the view of identity now taken is precisely that here referred to, and I am indebted to the Director for his kindness in sending me an account of the synonymy which is printed below as received. SCHULTZ was responsible for referring these plants to *Doronicum*, but generic distinctions were not then well understood, and it was not realised that *Senecio* might in some species agree with *Doronicum* in having the achenes of the ray without pappus. *Pericallis* is of sectional value in *Senecio*, and is so used by Dr. CHRIST.

*Senecio multiflorus* grows erect, branching above; the lower half of the stem is hairy, the upper part quite glabrous and distinctly glaucous. The leaves indicate the pinnate type by several reduced sessile lateral leaflets, opposite or alternate, varying from

ovate to greater comparative width. The terminal leaflet is large, nearly orbicular, deeply cordate at the base, somewhat pointed at the apex, and has an angularly sinuate margin, more or less denticulate. The petioles are auriculate and winged at the base in the upper leaves winged to the blade without lateral leaflets, and attended by reduction of the auricles. The veins of the leaf above and below are furnished with short stiff hairs; the general surface of the leaf above is glabrous, while below it is clothed with cob-web felt, similar to that of the garden Cineraria. All the growing points and the young inflorescences are thinly shrouded with arachnoid hair. The inflorescence is too well shown to need description; but the curious, with a strong lens, may discern interesting hairs on the bracts of the involucre, which are not found in those of the nearer allies that we cultivate. In comparing this plant an interesting, and perhaps new point, was discovered. Fine hair-like processes were observed on the achenes of some specimens. It does not appear, as we supposed, that reference had been made to them for purposes of distinction, but they certainly have significance in the natural history of the species possessing them. All the achenes of the disk are covered with short ascending hairs, and these, when wetted, open at the apex, and emit mucilage, and also two central strands of apparently denser mucilage, which persist and are evident after drying. A wetted achene is quite fringed with these processes, and with the mucilage, they have the effect, no doubt, of fixing the achene to the ground for germination. This recalls *Collomia*, but the case is not homologous. In *Senecio* the protoplasm disorganises and becomes mucilaginous, while in *Collomia* it is the cell-wall of the epidermal cells that degenerates, and on being wetted so softens that the internal spiral thickening of cellulose is set free, and escapes with the energy of a spring. In this case, no doubt, the seed is also fastened to the ground. The hairs of *Senecio* are best observed by scraping them off on a slide under a ¼ objective. When wetted, they immediately split wide open at the apex, or rarely down one side, and one or almost always two threads appear, which extend twice or perhaps three times the length of the hair. No lines of fission are previously evident. The process is retarded by a moment's immersion in alcohol. If then watery solution of Fuchsin is applied, the mucilage is stained a pale red, while the strands are stained more deeply of the same colour. By this method it is evident that there are two mucilaginous masses with one strand belonging to each. The threads are affected, probably by the Fuchsin, so that they do not extend to the length they attain in water. The foregoing is the result of little more than a cursory examination, and the hairs are worth more attention no doubt. It appears that each thread arises from a conical base, which under manipulation is sometimes ejected with the whole of the thread. All *Senecios* do not behave in the way here described, but the garden Cineraria shows it perfectly, and it would be interesting if it is in any way connected with the economy of island life. The achenes of the ray of these *Senecios* are not only without pappus, but also without these hairs, and they serve the purpose, probably, of reproducing the plant around itself. Having no pappus, they do not require, probably, a means of fixation to earth when once they reach it. *R. Irwin Lynch.*

**LINNEAN SOCIETY.**—An evening meeting will be held on Thursday, April 16, at 8 P.M., when the following papers will be read:—1. "BERKELEY'S Types of Fungi re-described," by Mr. G. MASSEE, F.L.S. II. "The Internal Anatomy of *Bidella*, Latr.," by Mr. A. D. MICHAEL, F.L.S.

**NATIONAL CHRYSANTHEMUM SOCIETY.**—We are requested to state that the annual outing of the members and friends of the above Society will, by the kind permission of Lord ALDENHAM, take the form of a visit to the gardens and grounds of Aldenham House, Elstree, on Monday, July 20.

\* *Senecio multiflorus*—D.C. *Prod.*, vi., 410, excluding syn. *Cineraria multiflora*, L'Her. (1837).

FIG. 69.—SENECIO MULTIFLORUS, D.C.: FLOWERS LILAC, WITH A DARK CENTRE. (SEE P. 460.)

**ROYAL BOTANIC SOCIETY.**—As a result of the discussion at a recent Fellows' meeting, the Council decided to open the Regent's Park Gardens on Easter Monday at a charge of 6d., when a band formed one of the attractions. The Council are, however, still opposed to the proposal to have musical promenades in the coming season on Saturdays and Mondays, the days the gardens are now open to the public. It is believed, however, that a large majority of the Fellows would, if consulted, disapprove of this decision, and accordingly a motion will be submitted at an early meeting that a vote of all the Fellows be taken on the proposal. *J. S. Rubinstein, Hon. Auditor, R.B.S.*

**ANCIENT SOCIETY OF YORK FLORISTS.**—A lecture was given on Wednesday evening, 1st inst., at the "White Swan," York, the headquarters of the Society, by Mr. W. A. CLARK (of Messrs. J. BACKHOUSE & SON, nurserymen, York), who took for his subject, "British Plants in their Native Habitats." It was illustrated by lime-light views. The lecture was of an instructive character, many of the principal mountains and lakes in Cumberland and Westmoreland being fully illustrated, and described. A few views of Corsica, showing the Lemon-tree in full fruit, Prickly Pear, and *Helleborus corsicus*, in its native place, were shown. A lengthy discussion on different plants and Ferns took place, after which a hearty vote of thanks was accorded the lecturer.

**THE PEOPLE'S PALACE HORTICULTURAL SOCIETY.**—The annual meeting of the members of this society was held on the 28th ult., and a large number of members attended. The society has existed since January, 1894, and has as members 346 adults and 54 children, a large proportion of whom exhibit at the society's shows. The report shows a steady increase in the number of exhibits, and improvement in their quality. Bi-monthly social meetings will be held, and an excursion made to some place of horticultural interest. The financial position of the society is satisfactory, although the members' subscription is low, so as to bring it within reach of the poorest.

**SPECIAL PRIZES FOR DESSERT APPLES AND PEARS.**—With a view to the formation of a definite list of the best-flavoured varieties of British-grown Apples and Pears for dessert at all seasons, Messrs. JAMES VEITCH & SONS, of Chelsea, have very kindly placed a sum of £30 at the disposal of the Council, who, in conjunction with the donors, have drawn up and sanctioned the following scheme, commencing with the society's first meeting in July, 1896, and continuing till the last meeting in June, 1897, the Temple Show meeting only being excepted:—Prizes for flavour. The four following prizes are offered for amateurs and gentlemen's gardeners only, at every fruit and floral meeting of the society (Temple excepted) on and from July 14, 1896, until and including the last meeting in June, 1897, subject to the under-mentioned rules and conditions. Class AA, for the best flavoured Apple, 1st prize, 10s., 2nd prize, 5s.; Class BB, for the best flavoured Pear, 1st prize, 10s., 2nd prize, 5s. Every exhibitor must guarantee that the fruit he exhibits in these classes has been grown entirely out of doors. He should also state on the name-card "Wall-tree," "Bush," or "Standard," together with the aspect—north, east, south, or west; the nature of the soil; the county; and, when known certainly, the stock on which the tree is grafted. The judges are requested to allot twelve points to a perfect dish of fruit—perfect in flavour, in quality, in appearance, and in size—distributing the points in the following proportions: for flavour, six points; for quality, three points; for appearance, two points; for size, one point. By "quality" is intended the meeliness and smoothness (absence of grittiness) of the flesh, or (as, for example, in the case of early Apples) its crispness and juiciness. By "appearance" are intended colour and beauty of outline and shape. By "size" is intended such as invests the fruit "with the greatest value for table use." "Enor-

mous specimens should not be preferred, as, beyond a certain point, size becomes a defect in dessert fruits." For further details we refer our readers to the leaflet, to be had on application to the secretary, Royal Horticultural Society, 117, Victoria Street, S.W.

**SPRING EXHIBITION OF THE ANTWERP ROYAL HORTICULTURAL SOCIETY.**—The organisation of this exhibition caused some interest in the Belgian horticultural world. The Council of the Society based its programme on the principle of leaving exhibitors free to arrange their groups to their own taste. This, like all innovations, raised a certain amount of opposition. This did not prove insuperable, but the Council decided to create, in addition to the system of groups, special classes. These, for the present exhibition, included, 1st, twenty-five Cinerarias; 2nd, twenty-five Calceolarias; 3rd, fifteen flowering Cannas. To make the classes as attractive as possible, many additional awards were offered for amateur and professional growers, the prizes including gold, bronze, and other medals. In order to encourage good cultivation, the Council instituted special certificates for good cultivation, with the restriction that the plant must be a constituent of one of the groups. The Special Certificate was designed by a competent artist. The following were the results of these innovations: 1, the exhibition was remarkable not only for the value of the plants staged; 2, the exhibition had the advantage over preceding ones of being more artistic in its arrangements; 3, the exhibition was much appreciated by the public; 4, no entry was received for the special classes, the Cinerarias were over in some cases, while in others the blooms were late—the *grand prix* proved no attraction; 5, the *Certificat de culture ou de floraison* was much sought after, and so judiciously awarded by the jury as to acquire additional value; 6, the idea of a special certificate for certain plants obtained such success, that the Council, at the request of the jury, formed a fresh class to include the novelties and the best varieties; 7, no complaint was made against the decisions of the jury—a rare thing, worthy to be noted. *Ch. De Bosschère.*

**DRIED PALM FRONDS.**—In the *Revue de l'Horticulture Belge* for April 1, M. D. GRADY speaks of the methods of treating dried Palm leaves, such as are now so largely used for ecclesiastical and decorative purposes. When, says M. GRADY, these branches [leaves] arrive dried from their native country, it is necessary to restore as much as possible their suppleness and original appearance. The following is the method of doing this as recently patented by M. FR. WILDE, of Gœrlitz. To restore to dried wrinkled and fragile leaves the appearance and suppleness of fresh ones, they should first be immersed in a weak caustic alkaline solution. When pliant enough to bend without breaking they are washed in water, drained, and then plunged into treacle diluted with water, where they remain for several weeks. They are then washed and dried in the dark. The leaves thus treated are more or less spotted; and are then cleaned, painted and coated with a supple varnish, which preserves them from atmospheric injuries.

**"BOTANICAL MAGAZINE."**—The plants figured in the April number of the *Botanical Magazine* are:—

*Pasoqueria macropus*, Martius (1841).—A very handsome stove-shrub belonging to the order Rubiaceae. It is a native of Brazil, and has shortly stalked, ovate acute leaves downy on the under-surface, and terminal panicles of long white fragrant flowers. The corolla tube is very slender, 4 inches long, with a five-lobed limb; the lobes oblong obtuse, each about 1 inch long; t. 7467.

*Hypocyrtia pulchra*, N. E. Brown, in *Gard. Chron.*, 1894, ii., p. 244.—A handsome stove shrub, with hairy leaves, green, with white spots above, pink beneath; t. 7468.

*Olyra concinna*, Hook. fil.—A curious grass, native of Costa Rica. In habit it is dwarf, tufted, with numerous simple, decurved filiform stems, with closely-arranged two-ranked, ovate lanceolate leaves,

ciliate at the edges, each about  $\frac{3}{4}$  inch long, and  $\frac{1}{4}$  inch wide. Judging from the figure, it would make a very elegant plant for dinner-table decoration or other similar purposes; t. 7469.

*Catasctum Randii*, Rolfe.—The male form has the perianth segments green, spotted with red, and a three-lobed lip; the lateral lobes short, deeply fimbriate, the central lobe with a deep fimbriate and lamellate crest. In the female plant, the flower is of totally different form, sub-globose, sepals and petals linear; lip posticous, pitcher-shaped. It is a native of Brazil, and was flowered at Kew; t. 7470.

*Phaleria ambigua*, Hook. f.—A climbing shrub belonging to the order Thymelaeaceae, and a native of Java. It has shortly stalked, ovate, lanceolate, glabrous leaves, and close tufts of white fragrant flowers. Each flower is about  $\frac{3}{4}$  inch long, with a slender tube, and a four-lobed limb; the lobes ovate, oblong, spreading; stamens protruding beyond the perianth tube. Flowered at Kew; t. 7471.

**CHANGE OF GARDENERS AT ALTON TOWERS.**—It has transpired that Mr. E. T. GILMAN will take charge of the gardens at Alton Towers, in succession to the late Mr. T. RABONE. He has had charge of the gardens at Ingestre for the past twenty years, and of the home farm for many years, and he has proved to be one of the best of British gardeners. Thirty years have passed since he was a pupil of RABONE's at Woodseat, and when the latter went to Alton Towers, he went with him, staying there for several years. In turn he was under Mr. W. MILLER at Combe Abbey, and Mr. STEVENS at Trentham. In 1874 he took charge of the gardens at Wootton Hall, a place about three miles distant from Alton Towers; and in 1876 he became head gardener to Lord SHREWSBURY, at Ingestre; and after twenty years' faithful service, his lordship marks his appreciation of his services by giving him a post which is considered by the profession to be one of its chief prizes.

**FLOWERS IN SEASON.**—From Mr. W. BULL, New and Rare Plant Establishment, King's Road, Chelsea, we have submitted for our inspection a few Cineraria blooms, in several very commendable varieties. The colours of the blooms are clear and good, and the size of same is equally satisfactory. One is pure white (excepting, of course, the disk), three represent different shades in purple and purple-blue, and another one is rosy-crimson. These self-coloured varieties are very fine of their kind, but the last named, as is usual in the case of flowers of this colour, is the smallest in size. Then there are white flowers margined in varying degrees with rose or blue, and others affording slight variations from all of these. In some of the flowers the florets are flat, in others they are much incurved longitudinally.

**ISLE OF WIGHT HORTICULTURAL IMPROVEMENT ASSOCIATION.**—The monthly meeting of the above Association was held at Brading Town Hall on Saturday, the 4th inst., when Mr. C. ORCHARD, Bembridge, gave a paper on "Vegetables, Old and New," showing the great progress made during the last 100 years. He staged a variegated Brussels Sprout, a cross between the old variegated Borecole and an ordinary Sprout. It was extremely pretty, and admirably adapted for decorative purposes. Mr. MUNSON, gardener to Rev. E. SUMMERS, Brading, staged specimens of *Osmanthus ilicifolius*, *Berberis Darwinii*, *Spiraea Lindleyana*, &c. Dr. GROVES, B.A., J.P., ably presided.

**CELOGYNE FLACCIDA.**—Mr. W. BULL sends us two flowers of *Celogyne flaccida* on the same spike. Both flowers are malformed; one has two sepals, two lateral petals decussate, two lips side by side, whilst the column is normal. The other flower is semi-double, with three sepals, three petals of the same shape and size, three lips, two of the usual shape, free, one reduced and adherent to the column.

**PROFESSOR HUGO DE VRIES.**—We understand that this gentleman will shortly replace Professor KAUWENHOFF in the Professorship of Botany in the University of Utrecht.

**GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—The QUEEN has been graciously pleased to give a donation of £25 in aid of the funds of the Gardeners' Royal Benevolent Institution, of which HER MAJESTY is the Patroness. The fifty-seventh anniversary festival will be held at the Hôtel Métropole on May 30, when the Lord Chamberlain (Earl of LATHOM) will preside.

**THE JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY.**—The part of the *Journal* for March, 1896, contains Mr. FRANCIS DARWIN'S thoughtful and suggestive essay on etiolation as a phenomenon of adaptation; in other words, he contends that the blanching is the result of the stimulus to growth in length consequent on darkness, whilst daylight "is a signal to the plant that it may slow down internodal growth, and begin to develop its assimilating machinery. The life of plants, like that of animals, is a series of responses to stimuli." Mr. BROTHERSTON contributes a paper on the "Carnation in Scotland." Mr. A. B. FREEMAN MITFORD'S valuable paper on "Hardy Bamboos" will be the standard of reference till his promised volume appears. The paper by the late Mr. BAUSE on "Crotoms and Draecenas" is a practical treatise, which will be appreciated by gardeners; the same remark applies to Mr. COOPER'S communication on "Nut Growing in England." Mr. ARTHUR SUTTON'S paper on "Potatos" is an interesting contribution to the history of the subject. The portrait of JOHN GERARDE is not the one in the original edition. The illustrations are serviceable, but some are spoiled by the process used. Mr. MASON'S paper on "Asparagus" is of a thoroughly practical character. Mr. SELFE LEONARD'S notes on "Rock Gardens" will be serviceable to those desirous of establishing these very charming departments of a garden.

**PRACTICAL HORTICULTURE.**—The March number of the *Journal of the Essex Technical Laboratories at Chelmsford* shows what excellent work is being done there in the study of practical horticulture. The courses are of short duration, but the instruction is so contrived that a great deal of solid information is conveyed in a short time; and if the cry of cramming be raised, it should be remembered that in this case the pupil is made to "cram" himself, which is a very different thing from being crammed by someone else; whilst the examinations, being largely of a practical character, afford some guarantee that the information given is digested and duly turned to account. The present number contains articles on seed-testing, on lime, on the culture of Rhubarb and Seakale, preceded by some clear indications of the physiological operations involved.

**CINERARIA.**—Messrs. SUTTON & SONS send a remarkable Cineraria, in which the flower-heads are fasciated, so as to form a compact, globose head, the size of a medium-sized Orange, so that it looks, as to form, more like a double Zinnia. It would be well to try and select or otherwise fix the variety.

**THE HYBRIDISATION OF ROSES.**—We understand that the examiners appointed by the National Rose Society to assess the merits of the several essays on this subject have unanimously awarded the prize offered by Mr. GRAY to Mr. WALTER EASLEA, of Waltham Cross. The referees were Mr. GEORGE PAUL, Mr. C. E. SHEA, and Dr. MASTERS, F.R.S.

**ACTION OF LIGHT AND MOISTURE ON FLOWER PERFUMES.**—M. EUGENE MESNARD contributes to the *Comptes Rendus* for February 24 some notes on the combined action of light and moisture on the perfumes of plants. The author sums up his remarks by saying:—"The intensity of the perfume of a flower depends, in fact, on the equilibrium maintained during each hour of the day between the pressure of water in the cells, which tends to eject from them the already-formed perfumes contained in the epidermis, and the action of light, which opposes this tardidity. The whole physiology of plant perfumes hangs on this simple proposition. This explains why, in Eastern lands, flowers are less scented than in our countries; why trees, shrubs, fruit and oven vegetables there are furnished with

odorons products more or less resiniferous; it also explains why the general vegetation is spiny and sticky: there is, in those countries, too much light, and not enough moisture."

CONIFER GRAFTING.

(Continued from p. 433.)

WE will now take the second section of the cone-bearers, the species of which may be easily distinguished even by a non-botanical student, as the round and oval fruits of the Junipers, Cypressess, and Arbor-vitæ are quite unlike the cones of the true Pines. Under the microscope, however, the wood presents the same distinctive markings in its minute long-pointed, pitted cells, as do all of the Pines, the chief botanical difference between them being the arrangement and disposition of the seed in the cones.

The proper stock for the Thujas or American Arbor-vitæ tribe is *Thuja occidentalis*, the so-called American Arbor-vitæ, but I have found the variety native to British Columbia and Vancouver Island [?].

FIG. 70.—  
CLEFT GRAFTING.

FIG. 71.—  
METHOD OF GRAFTING  
CYPRESSUS, JUNIPERUS,  
ERICA, ETC.

The *Thuja gigantea* of some make an admirable stock also. Two or three-year-old seedlings must be taken, with fine roots; they should be potted carefully, as directed before for the higher Conifers, and the stocks may be used when they are well established, remembering that from March to May is the best time to begin work.

The scions may be taken from any part of growing specimens, but those taken from the points of the lateral branches are preferable, as they make the most symmetrical plants; beside growing more quickly. Make a cut half through the stock, leaving a growing shoot above, and then adapt your scion (see fig. 71), saw a piece of *Thuja Barroni* (under which name I have grown and propagated the Golden Siberian Arbor-vitæ), or any other the stock of which you may wish to increase. Cut the graft half through, in a slanting direction, but leave it so long in the base, that when fixed, the lower nodes will be in the soil; bind tightly, and keep the whole close for a month or so under lights. Any of the Thujas may be thus grafted, such as Hovey's Dwarf form with golden bronze foliage, Elwanger's or Tom Thumb, lutea, a still more yellow-twigged form, though wanting in vigour, and Vervaeke's very useful Golden Sport.

The interesting and useful plants known as *Thujaopsis*, form a connecting link between Arbor-vitæ and Libocedrus, may also be grafted on the American stock. I wish to indicate *T. dolabrata* and

its variegated form, but one called *Standishii* appears to be simply a variation from the typical *Thuja Lobbi*, which sports greatly from seed. [The two are distinct; *T. Standishii* is Japanese. Ed.] To these may be added *Libocedrus decurrens* and *Libocedrus chilensis*. The last-named, with Don's variety, and the *Alerce* of Chili, are not hardy in this country, but the last well deserves a place in the winter garden, where it makes a lovely tree; both may be grafted on *Thuja gigantea*.

We now pass on to the Junipers and the Yews. For the Yews two stocks answer well, the red Cedar (*Juniperus virginiana*), and the common Juniper (*J. vulgaris*). All that is required is to pot young plants in the early autumn, and to plunge these in any light dry material until wanted. Select a stock as near the size of your scion as possible, and effect the grafting in the same way as directed for Arbor-vitæ. Tie securely, and smear with clay or grafting-wax. Keep the plants close for fourteen to twenty days, when a good union should be formed. The Chinese Juniper and Young's Golden variety, of which both are most desirable shrubs, may be grafted freely on the English or Siberian Juniper, and in the same manner as those above.

Many of the Conifers have been placed by botanists, first in one genus and then in another, some of which are probably connecting links. I allude to *Fitzroya*, *Saxegothea*, *Glyptostrobos*, *Cunninghamia*. Where rapid multiplication is not a necessity, however, it is better to increase these by layers or even cuttings, while the gardener with an experimental turn of mind may select a stock apparently similar, and make a trial for himself.

OUTSIDE GRAFTING.

Our first subject, if we except purely ornamental trees as the Almond, is the Cherry, the scions of which should have already been cut at least two months, and laid-in in a sheltered spot, protected from late frosts, as at this season when the sap begins to circulate, even a few degrees of frost will injure the wood by rupturing the newly-formed cells in the sap wood, which leads frequently to "gumming" and death.

There are three proper stocks for the Cherry. First, the erect and rapid-growing Cherry of our woods, *Prunus cerasus*; second, the wild Morello (or *Gean Prunus avium* (?)), indigenous in some parts of Kent on calcareous soils; and third, a distinct species called Mahaleb, from the strong odour of its flowers and wood, which latter is much used in Germany for pipe bowls. The first should be the stock used for raising standard trees for orchards; the other two are more suitable for producing dwarf trees to furnish walls, bushes, or pyramids for the fruit garden. I have had Morello pyramids on this stock, which seldom failed to crop abundantly year after year, and they possess a lovely appearance when in blossom. The practice in nurseries is to bed the stocks out when sufficiently stout, leaving plenty of room between the rows and each plant. Established stocks are hudded in July, not at the base, as is usual in the case of other fruit-trees, but at the exact height at which you desire to form your head. In the following March and April all those in which the bud has not taken are grafted. Buds fail to take from various causes. One not generally known is a small beetle, which lays its eggs at the base of the bud, and as a perfect insect eats away the vital part of the bud; while frost, and our handsome enemy the "Pick-a-bud" (Bullfinch), often leads a hand or beak in the mischief. At any rate, there are sure to be some failures, and these must be made good by grafting in the spring. Head back all the stocks that need this operation, and having prepared some "pug" by working fresh horse-droppings into stiff clay, cut the stock at the required height diagonally, with one clear cut, tongue this by a cleft about half way down, and cut the scion, about 5 inches long, with a long heel (see fig. 70). Tongue this and adapt it accurately to the stock, taking care that the bark of stock and scion fit nicely on one side, or, better still, on both. Bind closely with bast or raffia, and apply your prepared pug, so as to perfectly exclude all air. Finish to a

point round the top of the graft, and the same at the base, this being the best form to throw off the rain, which otherwise will soften the clay, and necessitate a second application. Should the season be mild, in less than a month the buds on the inserted grafts will push, and a little later it will be necessary to apply top sticks. These are easily made by cutting a piece of Ash or Hazel the required length, and splitting it in two through the pith, ticing it at the base, and again just below the union of your scion with the stock. Such supports are very necessary to prevent the wind breaking the shoots or grafts. At the same time examine the tie, to see that it will not cut the swelling scion, and so injure the base.

The Mahaleb and wild Morello stocks are grafted as near the ground-line as convenient, the operation being otherwise identical with that described. The "top stick" for these can be thrust into the ground parallel with the stock, and the growing graft secured to this. Use also the Morello stock for the Morello race, Kentish, Flemish; or, as Dr. Hogg classes them, Griotte's Cherries; and use the Mahaleb for the Bigarreau and fruits of that race.

For ornamental purposes only we have some very fine Cherries. Of these the double-flowered form of the Wild Cherry is exceedingly handsome. These should be worked high and low on the common stock, while the double form of Morellos will do best on the P. Cerasus; but there is a silver variegated form of Mahaleb which forms a very pretty tree. It grows close, and forms a head flowering freely in June, and producing a crop of its small stony Cherries, a few of which may be used with Morellos, in making Cherry-brandy, as they add both flavour and aroma to the beverage. This should be worked on a strong Mahaleb stock, and allowed to grow from 5 to 6 feet. *Experience.*

## THE CARNATION IN AMERICA.

MR. J. H. CONNELLY discourses on Carnations in the March number of *Scribner's Magazine*, and gives wonderful accounts of the growth of the Carnation in America. He, of course, deals with the history of the Carnation, and therein makes several statements which will be read with surprise by Carnation growers in England and elsewhere, as they are new to some of us who have studied the Carnation in its historical as well as in the life-history of the plant for many years. For instance, we are told that "long before the Christian era the Carnation had become established as a fixed type of special differentiation from the small single *Dianthus* of the Mediterranean region;" and making a bound from long before the Christian era to early in the second century, he says it was "lauded by Dioscorides as a flower of surpassing charms and virtues." Passing from the second century, we are further told that cultivators during the dark ages "simply amused themselves with its infinite diversity, seeking to effect no other improvement than increase of its size." In this they seem to have been so successful that in 1613 "they had attained a strain of Carnations that frequently were 3½ inches in diameter." More marvellous still, we are informed that "there were blue Carnations in 1700, and as there have always been yellow ones, who can affirm that blends of those primaries did not produce natural greens centuries before perverted taste employed aniline dyes to create such ghastly mockeries of nature." This leads us up to 1750, when "some of the leading floriculturists of France undertook 'breeding off' the fringe of the Carnation petals." For a century and a half we are led to believe that the French cultivators were manfully and hopefully working to obtain erose petals instead of fringed ones, and "they are greatly encouraged to hope that in a few centuries more, smooth round petals like those of the Rose may be obtained;" and while still striving for this, we are told that a grower named Dalmais picked up prizes of greater value. Mr. Connelly supposes that the Huguenots introduced the Carnation to America. The English are out of it. "The Pilgrims did bring to America the 'Clove'

or Paisley Pink and the Sweet William, but they did not bring the Carnation." The long article in question, covering ten pages, is embellished with a dozen or more "cuts" of Carnations; they are all fringed, rough things. The writer does not seem to be aware that any improvement has taken place in England, therefore it will be news to him to be informed that the rounded petals without fringes have been obtained by the skill of English horticulturists generations ago. Of course, there are some who prefer a Carnation with fringed petals, as being more in accordance with their artistic taste; but I am certain that by far the greater number of Carnation fanciers prefer the symmetrical forms of the Carnation that have attained the highest points of excellence as set forth by our leading florists. Mr. Connelly writes with the vaguest ideas of English classification. These are his words:—"The English system of classification by colour only is necessarily indefinite and unsatisfactory;" and presently we are informed that "the American classification is, perhaps, most servicable, and nearest to precision." Here it is in full:—"1, Grenadins (single flowers, generally dark, grown for perfume-making mostly); 2, Border sorts (used for outdoor cultivation); 3, Malmaisons (sturdy plants, bearing enormous fragrant flowers, pink or red, suitable for outdoor growth, yet admitting of successful forcing, but with the common vice of bursting the calyx); 4, Forcing or Bench Carnations (grown for winter blooming); and 5, Marguerites (the semi-dwarf Italian type)." It seems that there is also an American Carnation Society which registers the names of all varieties deemed worthy of culture. This is certainly an important part of such a Society's duty; such a work might be appropriately taken up by the English Carnation Societies. In three years the new varieties of Carnations deemed worthy of registration is 142, which brings the number up to 562 varieties, and every one of the 142 were in the forcing class. It seems some enterprising growers have commenced to give part of their attention to improving the border class; but the commercial element comes in, and we are informed that border Carnations will only fetch 1s. a handful, while the forced varieties will sell for 2 dols. per dozen blooms. Each winter, 15,000,000 cut Carnations are required to supply the New York markets, and the demand is ever ahead of the supply in all the choice varieties and high grades thereof at ever-advancing prices. Instructions are given as to methods of propagation, &c., which is much the same as those practised here, but the after-treatment differs slightly. The young plants are planted out in an open field in May, and about the end of August they are brought into the greenhouse or forcing house, and are planted out on benches in rich soil only 4 inches deep. Root-action starts quickly amongst these benched plants, and they must force ahead very rapidly indeed, for they are said to be in bloom in from four to six weeks; twenty good flowers are considered a fair average for each plant, but some plants will produce a hundred; the flower-stems are trained to wires one above another, and they grow from 2 to 3 feet high. The following information may be useful to English growers as well as American: "Carnations soon wither if sent to market immediately after being cut. They are therefore taken from the plants the day before they are sent away, and given twenty-four hours in a cool cellar, with their stems plunged deep in clear cold water. This hardens them, so that they will last for days in the hands of purchasers. Indeed, Carnations shipped across the ocean from Long Island greenhouses have been worn to the opera in London and Paris still fresh, beautiful, and fragrant." One would not think it was worth while to send Carnations from Long Island greenhouses to London, as English growers can supply more beautiful varieties. The varieties figured and recommended are The Meteor, crimson; Lizzie McGowan, white; The Storm King, snow-white; William Scott, light clear pink; Bridesmaid, bright pink; Alaska, snow-white; Daybreak, flesh-pink; The Jumbo, Malmaison seedling, reddish crimson; The Goldfinch, yellow Picootee; The Samson, white ground, striped and edged with pink; Helen Keller, variegated white ground. *Jas. Douglas.*

## HOME CORRESPONDENCE.

**STEAM LAWN-MOWERS.**—Your correspondent, Mr. P. Wilkinson, p. 399, seems to welcome the advent of the steam lawn-mower. Myself, I agree with Mr. Mawson, that a garden should be a place of quiet refreshment—a retreat from the hurly-burly and every-day town; and allowing for the important part played by the steam-engine as a means of locomotion, and as a producer of most of the appliances of civilisation, I do not think a case has been made out for its application to lawn-mowers, and I hope the day is distant when steam lawn-mowers will be puffing and snorting in the sylvan retreats of rural England; for if the quiet at present enjoyed in the surroundings of country mansions be broken up by steam lawn-mowers and other complicated machines, I agree with Mr. Mawson that one of the great charms of quiet out-of-doors life has departed. The objections to lawn-mowers when drawn by horse or pony, alluded to by Mr. P. W., have no real foundation in fact, for if the lawn is too wet for the machine, it pays to use scythes occasionally; and boots are generally used to prevent horses' feet sinking into soft lawns—and as to treading down edges and flower-beds, it does not say much for the driver of the pony. I know from experience that there is not much poetry in the movement of a 22-inch lawn-mower when you are responsible for half the motive-power on a hot day, but it is good exercise for a strong, healthy man. *R. M., Newbury.*

**BULBS IN HERBACEOUS BORDERS.**—There is some truth in what Mr. Crump said in a previous number of the *Gardeners' Chronicle*, about planting bulbs in beds by themselves; but at the same time, there is no reason why a few bulbs should not be planted on the borders of herbaceous perennials. In fact, I think they add much to the beauty of such borders. For instance, a few clumps of Scilla, Snowdrop, Hyacinth, Narcissus, and other early-flowering bulbs, wonderfully brighten up the borders at a time when but few of the herbaceous plants are in flower. The different species of Lily, many of which reach 4 feet and more in height, are very suitable plants to occupy spaces between tall-growing herbaceous plants; Hyacinthus candicans would also not be out of place in such situations. If the clumps are labelled or marked, the bulbs when in a dormant state and the stems have died down, should not be injured by careful workmen. *C. Collett.*

**ROSES, AND THEIR CULTURAL REQUIREMENTS.**—I read with much pleasure the contribution signed "Wild Rose," with most of whose opinions I entirely agree. There appears to be want of unanimity among rosarians regarding the amount of pruning required by such Moss Roses as the White Bath, the White Perpetual Moss, and Blanche Moreau, which I have long been accustomed to regard as the most beautiful varieties pertaining to this section. Doubtless, when the late Mr. Rivers, whose memory I reverence, recommended the practice of autumnal pruning (which is also enjoined by Mr. William Paul as a gradual preparation for that of spring, thereby rendering the latter less essential), he was speaking from a life-long experience. It was seldom, indeed, that he had not adequate premises for the conclusions at which he arrived. Though "close pruning" is generally advocated by modern horticulturists, whom such a conservative writer and advocate of the customs of the past as "Wild Rose" may be disposed to regard, not without reason, as somewhat revolutionary in their tendencies, yet I cannot say that I blindly follow in their foot-steps; for though I shorten my Moss and Tea Roses somewhat at this period, at present so atmospherically favourable for this purpose, I always take care not to shorten them too much. I have never advocated wholesale indiscriminate mutilation. Last spring many of my tenderest varieties were very severely pruned by the merciless hands of Nature herself, through the influence of an almost unprecedented frost; but they seemed to grow all the more vigorously, and bloomed the more profusely thereafter by reason of this ordeal. With other classes, however, the case is somewhat different. Such Noisettes as Maréchal Niel and Rêve d'Or, and most of the vigorous-growing summer-blooming Roses, which flower for the most part on the ripened wood of the previous year, must not be pruned at all, in the ordinary sense of that somewhat crucial conception; the longer shoots may, perhaps, with impunity be shortened very slightly, and weak or superfluous growths entirely eliminated—but that is

all that is requisite to promote their development and floral evolution. In such special instances as those of the Noisettes and the Austrian Briars, it is obviously of the utmost importance that the shoots of last spring, which the strong heat of summer and early autumn matured, should be as much as possible protected and preserved. The theories of "Wild Rose" on this and other subjects may be conservative; but so also are those laws of the physical world by which the universe is sustained. While it is obvious that he sympathises with all movements which are not only progressive but ameliorative, he is deeply conscious, like all writers who can think for themselves, that the present has been built upon the knowledge of the past. *David R. Williamson.*

**FLOWERING SHRUBS.**—It is some years since flowering deciduous shrubs were so attractive as they are this season. We have had no hard frost, the weather has been dry and calm with a few exceptions, and in a great measure it has been favourable to the flowers continuing a long time in perfection. Among shrubs which have flowered are *Jasminum nudiflorum*, *Lonicera fragrantissima*, and *Chimonanthus fragrans*. A plant of the latter growing against a house in our village was a lovely picture, it being literally covered with the fragrant flowers; and a bush growing on the lawn in the garden here, exposed to the north-east, has been in bloom more or less all throughout the winter, and though the frost was so severe last winter, it made a fair amount of growth during the summer. Plants in sheltered places, such as *Daphne Mezereum*, *D. laureola*, *Garrya elliptica* *femina*, and *Pyrus japonica*, are still very showy. *Prunus pissardi*, one of the earliest of the species of *Prunus* to open its flowers, is at the present time a mass of bloom. The small purple flower-buds have a very peculiar appearance before they burst. It is a shrub that deserves to be extensively planted on account of its flowers and the colour of the foliage. Some of the *Magnolias* will soon be in bloom, and I do not recollect seeing so many flower-buds on the plants as this year. *Andromeda floribunda*, with its Heather-like bells, has long been in bloom; while *Spirea Thunbergii* and some of the early-flowering *Berberis* have helped to make charming variety. The growth of *Solanum jasminoides* planted against an east wall is as green now as during the summer, and some fine clusters of bloom may be hoped for by-and-by. Many of the shrubs, too, are still carrying their berries. *Escallonia* and *Ceanothus* have stood well, and we may therefore hope to be rewarded with flowers later on. Some of the early-flowering species and varieties of *Rhododendron* are very beautiful, but none in the spring is more so than *R. Nobleanum*, particularly the scarlet-flowered variety; and in a season like the present they are perfect. *Azalea mollis* promises to be good this season. There are hundreds of the old *A. pontica* planted in the woods at Buxted which the rabbits never touch, even when short of food; neither do they touch *Dentzia scabra* when it has grown up, although *D. gracilis* is eaten off close to the ground. *H. C. Prinsop.*

**AUCUBA JAPONICA IN BERRY.**—The *Aucubas*, where they have a male plant near them, are grandly berried this spring. At Gunnersbury Park, where good-sized bushes abound, and where a male plant is dotted about here and there, the bushes are laden with brilliant red berries, and however much a plant is hidden away among other shrubs, it is found to be bearing fruit. At the St. Marylebone Cemetery, East Finchley, where the *Aucubas* grow with wonderful freedom in the stiff clay, and where with wise precaution male plants were dotted about years ago, there is a marvellous wealth of berries, and they are very fine in point of size. What strikes one in walking round the pleasure-grounds of Gunnersbury Park is the fact that here and there the pollen must have travelled a considerable distance, carried probably largely on the wings of the breeze, though insect agency may have assisted in the work. There is reason to believe that a warm sunny March, like that experienced last year, operated to bring out the bloom of the male and female types more nearly together, and complete impregnation resulted. This spring the time of flowering of the male appears to be pretty well a month in advance of that of the female, as on the 28th ult. I saw plants at Gunnersbury Park in full bloom, with but little present promise of inflorescence on the part of the female. It may be that the pollen remains long upon the male flowers, and is thus preserved until the time of blooming of the female. A few years ago I was spending Easter-time in the South of England, and on attending service at the parish church in the evening I noticed the abundant use of brilliant red

berries among the Easter decorations. In the dim light, and at some distance from the pulpit, I could not detect what the berries actually were, but on passing the forecourt garden of an adjacent mansion on the following morning, I noticed that some large bushes of *Aucubas* were heavily berried, and that they had been turned to account in the parish church. The berries are in perfection at Easter, and they can be appropriately employed in festive celebrations. But some do not know that the presence of a male plant is necessary for the production of berries by the female, and it is well to make assertion of this fact from time to time. If Robert Fortune in his extensive travels had done nothing more than give to English gardens this valuable addition to our shrubberies, he would have deserved well of his country. In his *Visit to Japan*, after referring to the discovery of the male plant, he states:—"Let my readers picture to themselves all the *Aucubas* which decorate our windows and gardens covered, during the winter and spring months, with a profusion of crimson berries. Such a result, and it is not an improbable one, would of itself be worth a journey all the way from England to Japan." *R. D.*

**COLOUR IN APPLES.**—At the recent meeting of the Gardeners' Orphan Fund I had the pleasure of meeting Mr. Miles, of Southampton, and spoke to him as to the assumed artificial colouring of Blenheim Orange Pippin and other Apples, some discussion about which took place in these columns early in the winter. Mr. Miles had brought up with him some handsome richly-coloured and firm samples of this variety, the colour of which he entirely ascribes to his heavy dressings of soot. The trees are nearly thirty years old, and grow on grass-land. The value of soot as a herbage-maure has long been known, but it does not seem hitherto to have been largely used as a manure for the Apple. The soil is loam resting on gravel, and there is some reason for the inference that the thorough drainage, warmth of soil generated by the gravel base, and the undoubted warmth of the atmosphere conjointly, do much to produce rich highly-coloured fruit. But the gardener is fully entitled to regard the results obtained as being due to the soot-dressings when he finds trees not so dressed bearing fruit inferior in this respect. The subject is of interest, and merits investigation. *A. D.* [Why can it not be put to the test at Chiswick? *Ed.*]

**POSOQUERIA MACROPUS (LONGIFLORA).**—I am sending you a truss of bloom, also a photograph, of that beautiful and seldom-seen ornamental and sweet-scented stove shrub, *Posoqueria longiflora*. The plant grows and flowers freely at Stratfieldsaye, in the stove, where it gets plenty of heat and moisture. It grows in a flower-pot, in light peaty soil, and at the present time our plant carries thirty such trusses of bloom as the enclosed. Its height is 5 feet, and diameter 3 feet. *J. W. McHattie.* [It is illustrated in the current number of the *Botanical Magazine*, with the name *P. macropus*. *Ed.*]

**THE SNAPDRAGON.**—When growing in moist land, the plants of *Antirrhinum* which, flowering for the first time last season, have been selected for keeping through the winter, will often die, in all probability through excess of moisture at the roots; therefore it is well to lift any choice varieties growing in a retentive soil, and transplant them to a drier one, taking care, as far as possible, to lift them with balls of soil about the roots. As a precaution, it is well to take cuttings of anything choice, placing them round the sides of pots of light, sandy soil, and putting them in a cold frame or greenhouse. Some will be pretty certain to strike, though all may not do so. One has sometimes to wait for cutting wood, because the bushy habit of growth produces shoots which bloom. The best cuttings come from the wood thrown up round the main stem in autumn, and stock is also secured by placing stock plants in the gentle warmth of a greenhouse in spring, and striking them in moist sand; and plants so obtained, if re-potted once or twice, make good stuff to go out in the open ground at the end of May. In Scotland the named varieties of the *Antirrhinum* are popular, and most trading florists who grow the flower select seedlings and name them, whether they be self or striped. They would not do this were there not a demand for named sorts; the act of naming can be taken as a guarantee that only the finest varieties are selected for this purpose, and in forming a collection it is well to purchase some. If anyone will grow a few of the choice named varieties, and compare them when in flower with the quality of ordinary seedlings, they will soon perceive the differences in value, and recognise in the named

sorts massiveness, solidity, beauty of marking, and perfection in all the parts which make up a high-class form. Named sorts are usually sent out at the end of April and May, and though small and apparently spare in appearance when they come to hand, they soon grow into size when planted out in soil of good heart. I have had young green plants from Scotland packed for three or four days in moss, which when received appeared the worse for the transit; but when placed in a cold frame, sprinkled overhead, and shut down close for a few hours, they soon recovered, and in two or three days could be transferred to the open air with safety. But few self-flowers are named; the striped and flaked varieties find most favour, which is not to be wondered at; most have white, others ivory grounds; some are primrose or lemon, and some golden-yellow. The following could form a select collection: *Fascination* white, suffused with pink; *Firefly*, orange and fiery crimson; *George Finlay*, golden-yellow, streaked with crimson; *Lemon King*, a lemon self; *Miss Jellicoe*, cream, suffused with golden-yellow; *Purple Prince*, a rich maroon purple self; and *Zebra*, golden-yellow, pink, and crimson. *R. D.*

**AMERICAN LARCHES.**—Regarding the Black American Larch, *Tamarack* or *Haematack* (*Larix pendula*) referred to by Sir C. W. Strickland, I have received the following from Mr. Buchanan, of the Canadian Pacific Railway: "The *Tamarack* here is your Larch in all its purity. Its great use is for railway ties (in Britain, sleepers), and valuable for keeping so long sound when under ground. The tree is clear, clean, and free of skin, sound in body, a gentleman of the forest, and fond of his drink too; where he is found, water is not far off, and this would be noted in planting. With you, the Larch disease is becoming more and more serious, and that at a time when your forest resources should begin to be of value. Every country from France to Russia and Sweden has a department for woods and forests, with a view to their extension and preservation; and such an office for the United Kingdom would be of great value. I would suggest that a suitable person be sent out here to prospect and send home a supply of seed from the *Tamarack Larch*, which I have every reason to believe would be peculiarly suitable for planting in the British Isles. Such an investigation and report regarding the immense Larch forests here would be of undoubted value." Accompanying this letter was a map showing the wide range of the tree, particularly in the district intersected by the Canadian Pacific Railway. It is interesting to learn from your correspondent that this Larch, planted in wet, sandy soil, near a pond, has attained to a large size in this country, and probably Mr. Buchanan's suggestion regarding a fair trial of the tree in these isles is worthy of consideration. Hitherto the black Larch planted in England has not done well, but in several cases the trees were placed in soil the opposite of suitable for their development. I suppose the red Larch referred to by Sir C. W. Strickland as thriving so well at Boynton is the Western Larch (*L. occidentalis*)? *A. D. Webster.*

**NARCISSI AT TOTLEY HALL.**—There will be a grand display of *Narcissus* in bloom about the middle of the present month, numbering close upon three-quarters of a million bulbs, in 250 varieties, including some of the best sorts, such as *Weardale Perfection*, *Madame de Graaff*, and *Glory of Leiden*. The first-named variety is catalogued in Mr. Barr's list at 12 guineas per bulb, and it has, I believe, obtained First-class Certificate, wherever it has been exhibited. I may mention that through the kindness of W. A. Milner, Esq., J.P., the members of the Sheffield Chrysanthemum Society are going to visit the above place on the 18th inst. *One of the Members.*

**FORMING HERBACEOUS BORDER.**—Your correspondent, "H. W. W.," p. 436, does not shake my opinion one iota as regards the planting of bulbs with herbaceous plants proper in the same border. In the first place, bulbs are not herbaceous, according to florists or judges, many of whom will disqualify an exhibitor who puts up flowers of bulbous plants when "herbaceous" is specified. If this dictum is right, the wording "herbaceous border" is simply a misnomer. The appellation "mixed border" would be more accurate. But apart from this technical point, I maintain that all the bulbs named by "H. W. W." are far more effective, and certainly more enjoyable, when planted out in bold, irregular masses in the grass; besides, the short-lived and often bespattered effects given by the bulbs on the so-called "herbaceous border" would be seriously discounted later on, that is, whilst the foliage was dying down,

thus producing an objectionable contrast to the freshness of herbaceous plants proper. I imagine no one would expect a very gay flower-border out-of-doors during the months of January and February, whilst after such dates, *Doronicum austriacum*, and others, *Pulmonaria saccharata*, *maculosa*, and other Lungworts, the *Polyanthus*, and many more of the *Primula* family, early *Irises*, *Daisies*, *Alyssums*, *Anbrietias*, *Violas*, *Wallflowers*, &c., will be found to make the borders fairly cheerful and bright, to be followed by many flowering plants of the list given by "H. W. W.," on p. 399, with improved varieties of recent introduction. I know that the excellent effects produced in the herbaceous border by planting are bold but irregular groups, these ranging from 3 to 12 feet super, leaving at irregular intervals spaces for specimen plants, or possibly a group of specimen plants, one each of a choice or rare species, to give greater interest, without marring the effect as a whole. There are special conditions as regards our herbaceous border, viz., "bulbs are rigorously excluded; secondly, it is expected that a flower will be found therein on every day in the year." These conditions have been maintained so far, even during the frost of January and February, 1895, but this was only realised by removing the snow to reach the *Helleborus* (Christmas Roses), *Czar Violets*, &c. It should be stated the second condition is not a *sine qua non*, or imperative. Some of the best effects of bulb and other hardy flower planting is to be found in the gardens of Penrhyn Castle, as practised for many years by Mr. Speed on turf and under trees, which is not mown till the foliage of the bulbs has become mature. At Madresfield a good many thousands of *Aconite*, *Crocus*, *Snowdrop*, *Scilla*, *Chionodoxa*, *Paffodils* of sorts, *Narcissus*, *Hyacinth*, *Tulip*, *Anemone appennina* and *fulgens*, *Grape Hyacinth*, *Ornithogalum*, *Trillium*, *Orchis*, *Pritillaria*, *Allium*, *Colchicum*, terrestrial *Orchids*, *Lily of the Valley*, &c., are planted, all of which plants are worthy of any trouble taken to establish them. *Scilla campanulata alba* is a real gem when seen on turf, and its only fault is that it is a little late—not flowering till the grass has got tall. It is a good plan to prepare a piece of undulating land to plant the bulbs, and sow fine lawn-grass seeds, affording it an occasional top-dressing of manure, and cutting the grass with the scythe. For cultivating choice species of *Lilium*, *Montbretia*, *Alstroemeria*, *Gladoli*, *Hyacinthus candicans*, &c., a specially-prepared border, having a Yew hedge at the back, is excellent. *Lilium anatum*, *L. speciosum*, and the so-called Tiger Lilies, are a host of themselves. In this case it is necessary to leave a space between the Yew hedge and the bulbs, so as to be able to annually dig up the trespassing roots of the Yews. By thus keeping herbaceous plants, bulbs on grass, choice bulbs under special cultivation, and rock and alpine plants apart, bedding plants in the formal garden, flowering shrubs in large groups, with a background of evergreens, very enjoyable results are realised that greatly excel the heterogeneous mixture so often observed and recommended. W. Crump, Madresfield.

**LARCH DISEASE.**—I have not Professor Marshall Ward's book on tree diseases, having lent it, and would like to ask you, therefore, if it is a fact, as stated by Mr. Michie this week, that the disease is found "alike in seedlings of a year old, and in the transplanted lines in the nursery at any stage of growth." [We are unable to find such reference. Ed.] As far as I remember, Professor Marshall Ward's description runs in substance thus:—"The germs of the Peziza have first to be deposited in some wound in the bark; have next to be hatched; next to do their work; after which the ulcer has to develop and grow; all of which takes a good space of time." How, then, in seedlings a year old, or younger—i.e., "at any stage of growth"—is the disease explained? J. S.

**FLOWERING SHRUBS.**—I do not remember ever seeing the promise of flowering trees and shrubs so good as is the case this season. Thorns, *Lilacs*, *Dentzias*, *Ribes*, and *Rhododendrons* are particularly rich in flowers and flower-buds, and many of which have failed to flower for several years are going to bloom profusely. Roses are not at all satisfactory. The effects of the severe frost of last year is more apparent than before. Wherever shoots seem likely to fail, they should have the stunted wood well thinned out, and extra pruning given to induce new growth from the base, a good surfacing of farm-yard manure given over the roots, covering them with soil to retain the virtues of the manure, will do much to start free growth, and when growth is fairly begun, a good application of liquid manure is very helpful to recuperate the plants.

But lifting the roots entirely, and re-planting in fresh loam, then mulched with decayed manure, is the best restorer we know of when Roses are below par. Last year's frost has been useful in enabling us to decide what Roses should be avoided in making new plantations; many perished from the severity of the weather. We learn from some of our nursery friends that the sale of Roses and shrubs in the north has this year exceeded that of several years past. M. Temple, Carron, N.B.

**MR. W. MURRAY.**—Our Northern readers will regret to hear that Mr. W. Murray, gardener at Park Hall, Polmont, has been seriously ill, and confined to his bed for some months. The Park Hall fruit-houses are at present in fine condition, Vines breaking strongly, showing large bunches in abundance, the Peach-trees well set with fruit. M. T. Carron.

## SOCIETIES.

### ROYAL HORTICULTURAL.

**APRIL 7.**—In view of the circumstance that the meeting held on Tuesday last in the Drill Hall, James Street, Westminster, followed so closely upon Bank Holiday, the exhibition was in all ways satisfactory. While the hall was rather less full than is usually the case, there were nevertheless sufficient exhibits to give it a well furnished appearance, and a few novelties were staged. Orchids were present in more than the usual proportion, and Roses were shown in larger quantity than on any previous occasion since last season. A large display of *Narcissus* was made by Messrs. FARR & SON, and the Rev. G. H. ENGLEHEART contributed many interesting and valuable hybrids of the same flower. In addition there were several miscellaneous groups and plants of considerable attractiveness and interest. The lecture which should have been given in the afternoon by the Rev. G. HENSLOW on "The Movements of Plants," was unavoidably postponed owing to some mistake having occurred in regard to providing the necessary apparatus, and other circumstances, for displaying the slides with which the lecturer had intended to illustrate the subject.

### Floral Committee.

*Present:* W. Marshall, Esq., in the Chair; and Messrs. J. Fraser, J. Laing, H. Herbst, R. Dean, J. Jennings, J. F. McLeod, R. B. Lowe, C. J. Salter, R. M. Hogg, J. D. Pawle, G. Gordon, H. S. Leonard, C. E. Pearson, C. E. Shea, H. J. Jones, J. Walker, C. Bick, E. Beckett, G. Paul, E. Mawley, and Rev. H. H. D'Ombrian.

A large decorative group from Messrs WM CUTBUSH & SON, Highgate Nurseries, London, N., arranged on the floor of the hall, was one of the conspicuous features of the exhibition. The group consisted in a large measure of abundantly-flowered specimens of Indian and Ghent Azaleas. There were also *Magnolias* in pots, *Lilacs*, *Palm*, *Rhododendrons*, *Viburnum Tinus*, and a number of *Boronia*s and other hard-wooded greenhouse plants, all of exceptionally good condition (Silver Gilt Flora Medal).

A very bright but smaller group of plants was one from Messrs. JNO. FRED & SONS, Russell Park Nurseries, Norwood, S.E. In this one there were *Odontoglossum* in flower, a few *Dendrobium*s, *Lilacs*, *Caladium*s, and several fine *Cleives*, &c. (Silver Flora Medal).

Roses in pots were extensively shown by Mr. WM. RUMSEY, Joyning's Nurseries, Waltham Cross, Herts. Some of the high-coloured varieties, such as *Sénetour Vaisse*, were particularly good in colour. The salmon rose coloured *Noisette L'Idéal* showed many pretty buds, and there were numerous other varieties in very fine condition. Cut blooms of Roses from the same establishment included a good number of the white *Niphotos*, the pink *Souvenir d'un Ami*, and other Teas (Silver Flora Medal).

Messrs. PAUL & SON, The Old Nurseries, Cheshunt, Herts, exhibited a group of Roses in pots. The plants carried a good number of blooms in bright colours. An Award of Merit was recommended to the variety *Clara Watson*, a very pretty pink Tea; either in bud or partially-developed flower the form is very pleasing. Most of the other varieties shown were choice and good (Silver Banksian Medal).

Mr. GEO. MOUNT, The Rose Nurseries, Canterbury, exhibited a magnificent collection of cut Roses. Particularly pretty were the eighteen blossoms of *Catherine Mermet*, and in another box where alternate blooms of this lovely pink Rose were placed with the equally pretty white one, the Queen, the effect was charming. Captain Hayward was of a capital colour, and many other varieties were praiseworthy (Silver Banksian Medal).

Mr. FRANK CANT, Braiswick Nursery, Colchester, showed forty-eight cut Roses in excellent manner. Madame de Watteville and Ethel Brownlow were noticeable among others as being very pretty blossoms (Silver Banksian Medal). *Arctotis aureola* or *grandiflora* (Cape of Good Hope) was shown by Messrs CUTBUSH & SON, Highgate Nurseries, London. This is a very old Composite which grows from 1½ to 2 feet in height and produces large, decorative flower heads

of bright orange, fully 4 inches across. The plant has pinnatifid, serrated foliage, and has been known for upwards of a century and a half (Award of Merit).

From Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, were exhibited plants in flower of *Daphne Genkwa*, *Goryopsis pauciflora*, and a variety of *Cercas* from Japan, probably a very fine form of *Prunus Pseudo-Cercas* (see fig. 72, p. 467). The flowers are very large, semi-double, in colour white with a green shade, the centre of the flower of a pale rose tint. They also showed plants of *Sambucus racemosa plumosa foliis*, and *Rhododendron racemosum*. This *Rhododendron* is exceptionally free flowering and pretty. Both leaves and flowers are small, but the latter are produced in many-flowered clusters, and are silvery white and rose, altogether very charming. *Polygala chamaebuxus purpurea* was also shown in flower by Messrs. VEITCH. The plants were about three inches high, with small lanceolate olive green leaves, and bore numerous flowers. The wings of the flowers are deep purple, and the keel pale yellow (Award of Merit). A Bronze Banksian Medal was awarded this collection.

Messrs. JNO. LAING & SONS, Forest Hill, London, S.E., exhibited a plant of *Streptocarpus multiflorus* with bluish-purple flowers.

Mr. J. May, gr. to WICKHAM NOAKES, Esq., Leatherhead, showed a large specimen plant of *Caladium Noakesii*.

A group of plants of a white double flowered Stock was exhibited by Messrs. SUTTON & SONS, Reading. The plants and flowers were good, and the variety is evidently a suitable one for forcing (Award of Merit).

### Orchid Committee.

*Present:* H. J. Veitch, Esq. in the Chair; and Messrs. Jas. O'Brien (Hon. Sec.), Baron Sir H. Schroder, C. Winn, J. Douglas, W. Cobb, T. W. Bond, E. Hill, H. J. Chapman, W. H. White, C. Pilcher, H. Ballantine, R. Brooman-White, F. Hardy, and H. M. Pollett.

Again there was a fine display of Orchids from nurserymen and amateurs.

Baron Sir H. SCHRODER (gr., Mr. H. Ballantine), contributed, as is his wont, the largest number of fine varieties of *Odontoglossum*, besides other rare Orchids, and a few remarkable crosses raised at "The Dell." Foremost among these was the rich crimson purple coloured *Calanthe* Baron Schroder, and among the *Dendrobium*s several very pretty unnamed kinds. Among other things noted were *Odontoglossum crispum flavescens*, with almost wholly yellow flowers; *O. Halli xanthodon*; the very showy *O. triumphans* Hillingdon variety, which had previously secured a First-class Certificate; *O. x elegans*, and a very singular white hybrid spotted with brown, which, while coming near to *G. x Wilkeanum*, possessed distinct features, which were evident when compared with the fine *O. Wilkeanum* beside it. There were also present the light rose-coloured *Cattleya Lawrenceana* concolor, the blue *C. L. Vinckii*, both unique; *Laelia x vitellina* and another fine orange-coloured hybrid *L. C. x Doris*, var. *Xantho*; the handsome *Laelia x Veitchiana*; the pure white *Dendrobium superbum* Dearell, and the bluish-white *D. S. Burcki* (Silver Flora Medal).

F. HARDY, Esq., Tyntesfield, Ashton-on-Mersey (gr., Mr. T. Stafford), showed his handsome *Dendrobium x Cllo*, Tyntesfield variety (splendidissimi *lum. grandiflorum x Wardianum*), which although belonging to a very variable class (as evidenced by the clear white *D. x Cllo album* (also shown by Mr. HARDY) was a very great way in advance of any previously seen. Its large handsome flowers consisted of sepals and petals nearly equal in size; the former magenta-purple coloured, with a narrow white margin; the latter of the same colour, with a broad white border, and the lip orange at the base with a chocolate-coloured disc, surrounded by a white zone and tipped with magenta colour. The ovate oblong form of the lip, too, is remarkable. The plant was awarded a First-class Certificate. Mr. HARDY also showed *D. x Venus* with over twenty flowers, *D. Falconeri giganteum*, and two pretty hybrids raised at Tyntesfield.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, were awarded a Silver Flora Medal for a very fine group of rare and handsome Orchids, among which were their splendid hybrids *Laelio-Cattleya x callistoglossa* and *L. e. x Pallas*, two of the most beautiful yet raised; the fine Indian yellow and red *Laelia x Latona*; *Dendrobium x Baryalus* and *D. x manicans* (*Wardianum x luteiflorum*), one of the most beautiful of *Dendrobium*s; *Cymbidium x eburneolumianum*; *Cyrtopidium x macrochilum*; *C. x Phædra*; *C. x Morgania*; *C. x Bryza*, and other *Cyrtopidium*s; *Masdevallia x Asoodia* *Reichenbachiana* (gr., Chels. in ♀), and other novelties which were arranged with varieties of *Cattleya* Schroderae, *Odontoglossum*s, varieties of *Lycaste Skimieri*, *Epidendrum Wallisii*, *Lycaste cruenta* Rossiana, *Oncidium ampliatum majus*, &c.

The Hon. WALTER ROTHSCHILD, Tring Park, Tring (gr., Mr. E. Hill), showed a six-flowered inflorescence of a beautiful *Stanhopea*, with rich yellow sepals and petals, spotted with crimson. The hypochil was orange coloured with almost black blotches at the base and on each side; the rest of the lip ivory white spotted with crimson on its upper surface (Award of Merit); and *Eriopsis* species allied to *E. rutidobubon*, with clear yellow sepals and petals with purple margin, and pure white lip with purple spots (Botanical Certificate).

Messrs F. SANDER & Co., St. Albans, staged a very effective group. In it were *Cymbidium Lowianum* and its green variety variously called *C. L. virida*, *C. L. concolor* and *C. L. Mandalanum*; the pretty *Dendrobium Dormesiae*, some grand examples of *Oncidium varicosum*, *Cyrtopidium*

Rothschildianum, Epiphronitis x Voitchih, Miltonia Warscewiczii, Odontoglossum elegans and the singular little O. elegantulum; Maxillaria Sanderiana, Angræcum modestum, A. fastuosum, &c. (Silver Banksian Medal).

W. THOMPSON, Esq., Walton Grange, Stone, Staffordshire (gr. Mr. W. Stevens), showed some very handsome and distinct Odontoglossums. Odontoglossum triumphans "Mrs. Guest," a very richly tinted variety, bore a fine branched inflorescence of over fifty flowers and secured a Cultural

petals were snow white (First-class Certificate); a noble plant of the pure white Dacrydium (Epidendrum) bicornutum, with many spikes (First-class Certificate and Cultural Commendation); and a grand example of Dendrobium atroviolaceum with several spikes (Cultural Commendation) To the credit of the gardener it should be said that all these plants had been grown by him for years, and the awards were therefore more appropriate than when they are given to recently-imported plants.

Messrs. Limlen, l'Horticulture Internationale, Park Leopold, Brussels, staged a group of hybrid Odontoglossums which seemed to disclose fresh complications in this puzzling section. O. x spectabile, which secured an Award of Merit, resembled in some respects O. excellens, but on the other hand it differed in many points. Its pretty flowers were yellow, effectually spotted with chestnut-brown. O. x concinnum had flowers of a pale yellow, heavily blotched with brown on the sepals and spotted with the same colour on the

FIG. 72.—SINGLE-FLOWERED FORM OF PRUNUS PSEUDO CERASUS. (SEE P. 466.)

Commendation. O. Halli Thompson's variety also bore a grand spike of flowers equal in quality to those of O. H. magnificum, but with a large, snow-white lip, prettily spotted with cinnamon brown. Mr. THOMPSON also showed a very large O. Cervantesii and an equally good O. Rossii majus; some excellent examples of O. luteo-purpureum, O. Wilckeanum, a fine Ada aurantiaca, &c. (Silver Banksian Medal).

Major JOICEY, Sunningdale Park, Sunningdale, Berks (gr. Mr. F. J. Thorne), showed three very fine plants, each of which secured a well-merited award. Cypripedium exul, Major Joicey's variety, with very large flower, in which the half of both upper and lower sepals, and the tips of the

Mr. McARTHUR, The London Nurseries, Maida Vale, was awarded a Silver Banksian Medal for a group in which the central plant was Platyclinus glutacea (Cultural Commendation), with about 300 flower-spikes, and around it were Cattleya Schroderae, Odontoglossums, Dendrobiums, &c.

Messrs. HUGH LOW & Co., Clapton, staged a very pretty group composed chiefly of Miltonia vexillaria, both white and coloured varieties. With them were several examples of the pretty Dendrobium x Boxalli, Phalaenopsis x Intermedia Portei; a magnificent spotted form of Odontoglossum crispum, Cattleya Schroderae, C. Fraseri, &c. (Silver Flora Medal).

petals; O. crispum Junellianum had white flowers with the inner halves of the segment vinous purple; O. e. Calos was a very richly blotched form of the true crispum; O. Ruckertianum multi-maculatum, and the various forms of the O. x Wilckeanum class were very distinct (Silver Banksian Medal).

J. GURNEY FOWLER, Esq., Glebelands, South Woodford, (gr. Mr. Davis), showed a magnificent specimen of Dendrobium thyrsoiflorum with over thirty spikes (Cultural Commendation)

The Right Hon. JOSEPH CHAMBERLAIN, Highbury, Birmingham (gr. Mr. H. A. Burberry), showed Lælio-Cattleya

× Highburyensis (*Laelia cinnabarina* ♂, *Cattleya Lawrenceana* ♀), a very pretty hybrid with flowers of the form of *Laelio-Cattleya* × *Doris*. The inflorescence was two flowered, the flowers orange coloured tinged and veined with purplish-erimson and with dark claret-erimson lip (Award of Merit).

Mr. R. GULZOW, the Melbourne Nurseries, Pexley Heath, staged a very effective group of Orchids. Some remarkable *Cattleya Trianae* were in the group, and notably two fine white varieties, of which one called Gulzow's variety was the best in form we have seen. Also *Cypripedium Rothschildianum*, *Laelia purpurata*, *Oncidium Marshallianum*, &c. (Silver Banksian Medal).

WALTER C. WALKER, Esq., Percy Lodge, Winchmore Hill (gr., Mr. G. Cragg), was awarded a Silver Banksian Medal for a very effective group, in the centre of which was a fine example of *Cypripedium punctatum* with a spike of over 180 flowers. In the group also were good *Cattleya Mendeli*, *C. Trianae*, *Cymbidium Lowianum*, *Laelia Boothiana*, and some grand examples of *Dendrobium superbum giganteum*, &c.

WALTER COBB, Esq., Dulcote, Tambridge Wells (gr., Mr. Howes), showed *Odontoglossum luteo-purpureum nigrum*, one of the richest coloured of the species and *O. nevium majus*.

G. C. RAFAEL, Esq., Castle Hill, Englefield Green (gr., Mr. H. Adams), sent a fine spike of *Eulophia Elisabethae*.

R. BROMAN-WHITE, Esq., Arddarroch, Gardechead, N.D. (gr., Mr. Roberts), sent his new hybrid *Cattleya Laure-Mossiae* (*Lawrenceana* × *Mossiae*), a pretty hybrid with soft rose-pink sepals and petals and dark crimson lip, in form like *C. Lawrenceana* (Award of Merit).

C. L. N. INGRAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), sent *Cattleya* × *Wm. Murray* (*Lawrenceana* × *Mendeli*) shown at last meeting, and *C. × Wm. Murray* var. fulgens, a longer and richer coloured form (Award of Merit); also the handsome *Laelio-Cattleya* × *Sir Wm. Ingram* (*L. purpurata* × *C. aurea*), in shape much like *L. purpurata*, but with broad frilled lip. Sepals and petals dark rose; lip rich dark purple with lighter veining in the centre (Award of Merit).

THOS. SPATTER, Esq., and T. B. HAYWOOD, Esq., both showed *Dendrobium Hildebrandi album*.

J. T. GABRIEL, Esq., Streatham Hill, exhibited the pretty pale yellow *Chondrychyna Chestertonii* (Botanical Certificate).

Mr. J. W. MOORE, Eldon Nursery, Bradford, sent *Dendrobium Boxalli*.

CHARLES YOUNG, Esq., The Thorns, Sevenoaks (gr., Mr. Ryder), sent *Cattleya Schroderae* Young's var., a very fine flower.

Mr. H. A. TRACY, Anyand Park Road, Twickenham, sent *Cymbidium Lowianum* Tracey's var. A finely-formed flower, with a short, richly coloured lip.

R. I. MEASURES, Esq., Cambridge Lodge, Cumberwell (gr., Mr. H. J. Chapman), showed *Cypripedium* × *Quies* (Hooker × *Curtisii*), and *Dendrobium albo-sanguineum*.

A. H. SMEE, Esq., The Grange, Carshalton (gr., Mr. Cummins), sent a very fine spike of *Cymbidium Lowianum viride*.

**Narcissus Committee.**

Present: J. T. Bennett-Poë, Esq., Chairman, Miss Willmott, Revds. G. H. Engleheart, T. H. Marsh, Messrs. J. Walker, A. Kingenill, P. R. Barr, C. R. Scrase-Dickens.

This date probably represented the culminating point of the Narcissus-bloom, in the Southern Counties at least, but several well-known exhibitors were absent, owing to the near approach of other fixtures. The one conspicuous trade display was that of Messrs. BARR & SON, who were fully represented by some hundreds of vases of their choicest kinds. We noticed especially *Glory of Leyden*, *Gloria Mundi*, *J. B. M. Cunn*, many excellently grown flowers of the several white Ajax kinds, and a single bloom of the new and valuable *Weardale Perfection* (Silver Flora Medal).

Prof. M. FOSTER sent a scape of a curious and interesting hybrid between the small white *N. tazetta dubius* and *N. triandrus*, in character midway between the two parents.

Mr. J. H. CAMELL, Hathersage, Sheffield, sent a white Ajax seedling, like an enlarged *N. albicans*.

From Mr. J. Cornhill, Byfleet, came examples of double seedlings from the old double yellow of gardens by pollen of *N. cernuus*, *Emperor*, and the *Tanby Daffodil*. These were of botanical interest, but appeared somewhat too heavy and confused in form to rank as garden flowers.

The feature of the meeting, as regards Narcissi, was the large stand of hybrids and seedlings raised and shown by the Rev. G. H. Engleheart, Appleshaw, Amlow, which was awarded a Silver-gilt Flora Medal. All sections of the Narcissi were represented, but the new and distinguishing feature was a group of many vases of an entirely new strain of *N. poeticus* of splendid size and substance and having large eyes of deep orange-erimson. Many varieties of this strain, differing in size and form of flower, in habit of growth, &c., were shown, some of them being twice the size of the well-known *N. poeticus ornatus*, and with wholly red eyes. To one of these, *Dante*, a First-Class Certificate was unanimously awarded. A cross between *poeticus ornatus* and the late *recurvus* obtained an Award of Merit. A large ivory-white flower, resembling a white *Sir Watkin*, gained the prize for the best seedling.

Mr. ENGLEHEART also showed a flower of *Ajax Ellen Willmott*, white and gold, even larger in size and more massive in substance than as exhibited last year, when it won premier honours. Of *triandrus* hybrids not already shown, his stand contained *N. Minnie Hume* × *triandrus*, three varieties, two

pure white and one ivory, extremely beautiful; *N. Madame de Graaf* × *triandrus*, and several graceful and refined flowers from *N. poeticus* by the same pollen parent. A large gathering of the new *Ajax Golden Bell* was exhibited, and a profusion of seedlings as examples of the advance made in vivid orange and scarlet colouring, among which *Firebrand*, *Torch*, and *Cresset* may be noticed.

For a collection of twenty-four varieties of *Narcissus*, distinct, the 1st prize went to Mr. J. T. BENNETT POE.

The prize for twelve distinct varieties of white *Ajax* was gained by the Rev. G. H. ENGLEHEART, with a collection including several of his own seedlings.

**Fruit Committee.**

Present: P. Crowley, Esq. (chairman); and Messrs. T. F. Nivers, Geo. Bunyard, Rev. W. Wilks, A. F. Barron, G. W. Cummins, J. Cheal, J. Wright, R. Pife, G. Reynolds, H. Balderson, Geo. Wythes, W. Bates, Dr. Hogg, J. H. Veitch, J. Willard, A. J. Laing, and A. Dean.

There was a collection of Apples exhibited by C. J. MASSET, Esq., Garliestown, Scotland (gr., Mr. Jas. Day), including thirteen dishes in as many varieties. The fruit was produced on bushes upon the English Paradise stock. The quality was very good in most cases for such a district, and the condition was excellent. The varieties were Cox's Orange Pippin, Adams' Pearmain, Lord Derby, Betty Geeson, Lane's Prince Albert, Wellington, Galloway Pippin, Striped Beefing, Dutch Mignonne, Fearn's Pippin, Bramley's Seedling, and Alfriston (Silver Banksian Medal).

A dish of Pigs, St. John's, was shown by EARL PERCY, Syon House, Brentford (gr., Mr. Geo. Wythes).

Mr. WILL TAYLOR, Osborn Nursery, Hampton, Middlesex, exhibited half-a-dozen dishes of Apples, including two dishes of excellent fruits of *Annie Elizabeth*. To this fruit was recommended an Award of Merit, it never having been previously certified by the Society. Some of the members of the Committee voted against the proposal, on the ground that the variety in question is a shy bearer.

**OLYMPIA FLOWER SHOW.**

APRIL 8, 9.—In what is called the Palmarium here, a place well adapted for the purposes of a horticultural exhibition (good promenading space being secured), a fine Flower Show was held on the above mentioned dates.

The Show was mainly made up of groups of plants and cut flowers, and Messrs. JOHN LAING & SONS, Forest Hill, were large exhibitors, noteworthy being a fine collection of *Caladiums*, consisting of, amongst other good varieties, *Rose Laing*, *Jasper Crayer*, *Madame Fitz-Koehlin*, *Madame Jubert Koehlin*, excellent *Prince of Wales*, and *Comtesse de Maille*; a beautiful group of *Cliveias*, good varieties in the collection being *Lady Wolverton*, *Harry Laing*, *Vesuvius*, *John Laing* and *Her Majesty*; two good groups of *Conifers*, brightened up with *Acers*, *Roses*, and *Staphyleas*; a telling group of miscellaneous foliage and flowering and stove and greenhouse plants.

**Obituary.**

ROBERT BLACKIE.—Many of our readers will learn with regret the decease, at Cannes, on Thursday, April 2, of Mr. Robert Blackie, in his seventy-seventh year. The deceased gentleman was a member of the firm of Blackie & Son, Limited, Glasgow and London, publishers and booksellers.

**MARKETS.**

**COVENT GARDEN, APRIL 9.**

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

**OLD POTATOES.**

The season is working out the worst on record.

**NEW POTATOES.**

Supplies are coming to hand freely, and prices rule low except for very best samples. Prices rule from 8s. to 12s. per cwt. J. B. Thomas.

**SEEDS.**

LONDON: April 8.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report that the fine weather naturally tends to improve the sale of farm seeds, and consequently an active consumptive business is now in progress. Values all round are without material change, and continue at the remarkably low level previously noted. Indeed, prices are now at such a point that they offer considerable temptation for holding stocks over until next season. Tares keep cheap. Hemp and canary seed realize former quotations. There is no alteration in either Peas or Haricots.

**FRUIT AND VEGETABLES.**

BOROUGH: April 7.—Quotations:—Savoys, 4s. to 4s. 6d.; Cabbages, 2s. 6d. to 3s. 6d. per tally; Onions, 3s. 6d. to 5s. per bag; Carrots and Turnips, 2s. and 3s. per dozen bunches; Horseradish, 8s. to 10s. per dozen bunches; Apples, 4s. to 6s. per bushel.

SPITALFIELDS: April 7.—Quotations:—Broccoli, 9d. to 1s. per bushel; Greens, 1s. to 1s. 3d. per bushel; Kale, 9d. to 1s. do.; Sea-kale, 9d. to 10d. per bundle; Bunch Greens, 2s. 6d. to 3s. per dozen bunches; Spring Onions, 1s. to 1s. 6d. per dozen bunches; Penoles, 1s. 6d. to 2s. do.; Mint, 1s. 6d. to 2s. do.; Beetroot, 1s. 3d. to 1s. 6d. per bushel; Parsnips, 6d. to 8d. per score; Rhubarb, 1s. 9d. to 2s. per dozen bunches; Cauliflowers, 1s. to 1s. 6d. per dozen; Leeks, 1s. to 1s. 6d. do.; Apples, Cooking, 6s. 6d. to 6s. per bushel; dessert do., 6s. to 7s. do.

PARKINGDON: April 9.—Quotations:—Carrots, 2. 6d. per dozen bunches; Turnips, 2s. do.; Onions, Spring, 2s. do.; bag Onions, 3s. per bag; Leeks, 2s. per dozen; Cauliflowers, 2s. per dozen; Rhubarb, 2s. 6d. per dozen bunches; forced, 1s. do.; Beets, 9d. per dozen; Kale, 9d. per bushel; Sea Kale, 13s. per dozen bunches; Broccoli, 1s. per bushel; Greens, 1s. do.; fresh Lettuce, 1s. 6d. per dozen; Radishes, 1s. per dozen bunches; 1s. 3d. per box; Parsley, 2s. per dozen; Cucumbers, 3s. to 6s. per dozen; Apples, Nonpareil, 24s. per barrel; Californian Newtowns 18s. 6d. per case; Pineapples, 2s. 3d. and 2s. 6d. each.

**POTATOS.**

**BOROUGH:** April 7.—Quotations ranged from 35s. to 85s. per ton.

**SPITALFIELDS:** April 7.—Quotations:—Black lands, Bruco, 50s. to 40s.; Reading Giants, 35s. to 45s.; High lands, Main Crops, 40s. to 55s.; Bruco, 40s. to 50s.; Reading Oiants, 45s. to 55s.; Sutton's Abundance, 50s. to 60s.; Drooco, 50s. to 65s.; Scotch, Main Crops, 40s. to 55s.; Bruco, 40s. to 52s.; Dunbar, 70s. to 85s. per ton.

**FARRINGDON:** April 9.—Quotations:—Hard to quote, but ranging between 30s. and 80s. per ton.

**LONDON AVERAGES:** April 8.—Saxons, 70s. to 80s.; Dunbar Bruco, 60s. to 70s.; do. Maincrop, 65s. to 75s.; Sutton's Abundance, 45s. to 55s.; Maincrop, 45s. to 55s.; Imperators, 30s. to 40s.; Magnums, 30s. to 35s. per ton; new Jersey and Guernsey, 3d. to 4d. per pound.

**CORN.**

**Averages.**—Official statement of the average of the prices of British Corn, imperial measure (qr.) during the week ending April 4, and for the corresponding period last year:—1896: Wheat, 24s. 7d.; Barley, 21s. 10d.; Oats, 13s. 3d. 1895: Wheat, 20s. 4d.; Barley, 20s. 11d.; Oats, 14s. 5d.

The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.	BRIGHT SUN.	
	ACCUMULATED.						
	Above (+) or below (-) the Mean for the week ending April 4.	Above 42° for the Week.	Below 42° for the Week.	Above 42° difference from Mean since December 29, 1895.

The districts indicated by number in the first column are the following:—  
0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; \*Channel Islands.

**THE PAST WEEK.**

The following summary record of the weather throughout the British Islands for the week ending April 4, is furnished from the Meteorological Office:—

"The weather during this period varied a good deal in different parts of the kingdom; over Ireland and the greater part of England the sky was generally cloudy or overcast during the daytime, and frequently clear at night; on our south and south-west coasts and in the north and west of Scotland, however, the days were mostly fine. Showers fell occasionally in nearly all places, but they were, as a rule, very slight.

"The temperature was a little above the mean in Scotland and Ireland, and just equalled it in 'England, N.E.' and the 'Channel Islands,' but in all other districts it was rather below its normal value. The highest of the maxima were recorded on the 4th, and ranged from 62° in 'Scotland, E.' to 53 in 'England, E., and N.W.' The absolute

minima, which occurred on somewhat irregular dates, were generally low for the time of year, especially over England; the readings ranged from 23° in 'England, E.,' 25° in 'Scotland, W., and England, S.W.,' and 26° in the 'Midland Counties,' to 35° in 'Ireland, S.,' and 38° in the 'Channel Islands.'

"The rainfall just equalled the mean in 'England, E.,' but was considerably less in all other districts.

"The bright sunshine varied greatly in different parts of the kingdom, but was generally above the mean in western parts of England and the east and west of Scotland, and below it elsewhere. The percentage of the possible duration ranged from 48 in the 'Channel Islands,' 46 in 'England, S.W.,' and 40 in 'Scotland, W.,' to 24 in 'England, E.,' 22 in 'Scotland, N.,' and between 15 and 16 in Ireland."

**ENQUIRY.**

"He that questioneth much shall learn much."—BACON.

Will some of our foreign correspondents kindly inform "Tree Fern" where he can obtain specimens of the rarer species of Alsophila, Dicksonia, Cyathea, and Cibotium, and many others mentioned by George Schneider in *The Book of Choice Ferns*? Also he would be glad to have the names and addresses of any collectors or florists in Australia, New Zealand, America, Cape, &c., who would be likely to have such specimens for sale.

**APHIS ON ROSES:** J. B. With a syringe use soapsuds, diluted tobacco-water, or quassa-water. All of them are quite safe to use. Syringing with clean water will clear the bushes if they are not badly infested, but as it must be often repeated, it is apt to damage the leaves.

**BEONIAS:** J. B. Start the tubers in small flower-pots of light sandy loam, keeping the top of the tubers rather above the soil. If you have a mild hot-bed it will favour growth. When the tubers start to grow, do not coddle them; air them daily a little, and as the season advances give more air, and in early June plant them a foot or more apart in well-manured soil, in full sunshine.

**BOOKS:** J. B. The manual of Messrs. Sutton & Sons, of which you enquire, is an excellent one for an amateur having some acquaintance with the art. Get the fifth edition.—*A. L. Gardeners' Assistant*, by Thomson, published by Messrs. Baekie & Son, Stanhops Street, Glasgow, a new edition is in the press. *My Garden*, by H. W. Ward, Longford Castle Gardens, Salisbury; to be had of the author.

**CATERPILLAR ON LEAVES OF THE APRICOT:** A. J. B. We could find no grubs in the Apricot buds, nor amongst the moss used for packing. Spraying with kerosene emulsion or some other approved insecticide might destroy anything remaining after hand-picking. R. McL.

**CYCLAMEN—OLD ROOTS REFUSING TO FLOWER:** North Devon. There have probably been errors in cultivation, but what these were we have no means of knowing. The bloom when coming up may have been eaten by slugs, weevils, &c. The Cyclamen succeeds best in a house slightly warmer and closer than that of the ordinary greenhouse.

**FLOWERING SHRUBS FOR PLANTING IN A WILD GARDEN:** G. B. Garrya elliptica, Ribes aureum, R. sanguineum, Azalea pontica, A. mollis, &c.; Rhododendron hybridum, R. caucasicum, R. Nobleanum, R. altaclarense, Leycesteria formosa, Buddleya globosa, Philadelphus coronarius, P. grandiflorus, P. Gordoni, Lilacs, Guedres rose, Erica carnea, E. vagans, and other species as clumps and edgings; Acacia hispida, Æsculus macrostachya, Hibiscus syriacus, Amelanchier Botryapium, Andromeda in variety, in peat beds; Berberis dulcis, B. vulgaris, B. aquifolia, and others; Colutea arborescens, Persian, Scotch, and Sweet Briars; Cytisus scoparius, C. s. Andranus, C. filipes, Forsythia suspensa, F. viridissima, any of the Dentizas and Weigels, Furze (double and single-flowered), Honeysuckles of a shrubby or scandent habit, Hypericum calycinum, H. hircinum, &c.; Kerria japonica, Rhus Cotinus, R. typhina, Rubus arcticus, R. odoratus, R. spectabilis, Sturtia malacodendron, Yucca angustifolia, Y. filamentosa, Y. flaccida, and Y. gloriosa.

**GRAPES:** J. W. The berries have been "scalded;" and better attention should be given to the ventilation of the vinery.

**KIDNEY BEANS:** Florist. Varieties to grow under glass are very various, but those commonly grown in this country are Newton Wonder, Osborne's Forcing, Syon House, White Flageolet, Black Belgian, and where space is abundant, Canadian Wonder (Red Flageolet). In an 8-inch pot, eight or ten Beans may be sown, and five or six of the strongest left for bearing. If beds are employed, the plant should stand in rows 1½ to 2 feet apart, according to height, and the plants in the rows 5 inches asunder. Both in pots and beds an earthing-up is necessary when the Beans have reached flowering height.

**LARCH BLISTER:** S. We have never seen seedling plants affected with this disease. Hartig does not mention seedlings as liable to this disease; nor do Marshall Ward or Somerville.

**NAMES OF FRUITS:** Hamlin. Winter Queening Apple.

**NAMES OF PLANTS:** J. Rogers. 1, Cornus mas, the Cornelian Cherry; 2, Piptanthus nepalensis; 3, Forsythia suspensa; 4, Leycesteria formosa; 5, Phrynum sp.?; 6, Ficus australis.—Novice. 1, The Lucombe Oak; 2, Forsythia viridissima; 3, form of Thuja orientalis; 4, Osmanthus ilicifolius; 5, Liriodendron tulipifera Tulip-tree; 6, Cornus mas.—C. B. Lonicera tatarica.—R. K. Pyrus japonica.—Bassett. 1, 2, 3, 5, Rhododendron campanulatum; 4, R. Falconeri; 6, R. fulgens (see *Gardeners' Chronicle*, p. 421); R. campanulatum is a very variable plant; 7, Skimmia Fortunei.—T. J. 1, probably Dendrobium Pierardi, flower much damaged; 2, Muscari botryoides; 3, specimen withered up; 4, Pulmonaria officinalis; 5, Erica carnea; 6, perhaps a Strelitzia.—Foreign. Bougainvillea speciosa; do not pack in cotton wool.—Nemo. 1, Corydalis lutea; 2, not recognised; 3, Sedum reflexum; 4, Sedum spurium; 5, Sedum rupestre; 6, Cyperus alternifolius.—H. Gandy. Cassinia fulvida.

**NOTICE TO QUIT SERVICE:** J. S. The gardener being, according to law, a domestic, is entitled to one month's notice, or wages in lieu thereof, and that notwithstanding the fact that he was paid his wages weekly. In case of misconduct of a serious kind, no notice is necessary.

**PEAS:** Florist. The land being light, you should sow only such as are of moderate height, as Dr. Maclean, Maclean's Best of All, Laxton's Marvel, Champion of England, and Veitch's Perfection.

**REMOVAL OF FRUIT TREES, ROSES, HERBACEOUS PLANTS, AND PALINGS:** H. B. The removal of the first two and the last, unless by permission of the landlord, would be a breach of the law, saleable nursery stock in plants excluded. The herbaceous plants, on the other hand, are not regarded as part of the freehold, and may be removed from one part of the place to another if they were in the ground when the tenant took possession; or may be destroyed if they were planted by the tenant.

**ROYAL HORTICULTURAL SOCIETY'S EXAMINATIONS IN HORTICULTURE:** E. J. You should apply to the secretary of the Society, No. 117, Victoria Street, Westminster, S.W. The kind of studies required by a candidate would certainly prove of value to any young gardener, but we cannot assert that they are essential to success in the business, which depends on many other circumstances.

**TREE FERNS:** Tree Fern. Nothing of the sort is sold by the authorities at Kew. Why not advertise your wants in the *Gardeners' Chronicle*?

**VINES:** J. B., Chelmsford. We have not the space in this column to give you full instruction on Vine-culture. You should buy a book on the subject, say *Grape-growing for Amateurs*, by E. Molyneux, to be had of Mr. L. Upcott Gill, 170, Strand, W.C. You do quite right to syringe your Vines morning and afternoon, but you must omit to do so when they are in flower; after the fruit is set, keeping the air moderately moist by sprinkling walls, floors, &c., several times daily, less so in dull than in bright weather. Beware of maintaining a cool, sluggish, damp air in the vinery, which favours the attacks of mildew on the shoots, leaves, and berries.

**COMMUNICATIONS RECEIVED.**—R. L. Harrow.—W. S.—J. S.—Thos. Carver.—S. J.—J. R. J.—C. Y. M.—J. D.—J. J. W.—R. D.—W. B. H.—Wild Rose.—H. T.—E. C.—E. M.—W. H. R.—L. G.—F. M.—D. R. W.—P. W. A., Hawkstone. **PHOTOGRAPHS, SPECIMENS, &c.** Received with thanks.—W. T. T. D.—Powerscourt.—Ch. de B.

# ROBERT WARNER & CO'S NEW PATENT WINDMILLS.

Saves Coal, Pumps Water, Grinds Corn, Cuts Chaff, &c.

Supports can be made in Teak, Iron, or Steel, for Hot Climates. One of Robert Warner & Co.'s Patent Windmills will be erected and worked at the Royal Agri. Show, Leicester.

Prices from £17, including Pump and Timber Supports. May 27, 1893, The Bell, Englefield Green, Surrey. ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C. Dear Sirs.—It affords me much pleasure to inform you the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully, H. BALLANTINE, Head Gardener to Baron Schröder. R. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne. NUMEROUS OTHER TESTIMONIALS ON APPLICATION TO 27, JEWIN CRESCENT, CRIPPLEGATE, LONDON, E.C. Engineering Works, WALTON-ON-THE-NAZE, ESSEX.

**FOWLER'S MEALY-BUG DESTROYER.**—It is easily applied, is instant destruction to both insect and ova, and does not stain or injure the foliage. In Bottles, 1s., 2s. 6d., 5s., and 10s.—CORRY & CO., Ltd., E.C. Sold by all Seedsmen.

# SHANKS'S LAWN MOWERS

THE ONLY ONES FITTED WITH PATENT AXLE SPRINGS.

STANDARD GEAR MACHINE,  
WITH PATENT AXLE SPRINGS.

HAND MACHINES.

Made in all Sizes, to out from 6 in. to 24 in. wide.

STANDARD CHAIN MACHINE,  
WITH PATENT AXLE SPRINGS.

TESTIMONIALS.

Lord's Cricket Ground, London, June 15, 1894.  
I have used your Lawn Mowers for over twenty years, and have no fault to find with them. I consider them the best in the market, and they are the only machines we use here. The addition of the springs to our 48-inch Mower is a great improvement, and the Machine works with great ease and smoothness. I consider you have made a good hit. Yours truly, (Signed), PERCY PEARCE, Ground Supt

Surrey County Cricket Club, Kennington Oval, London, April 3, 1894.

I have given our large Machine that you fitted with your Patent Springs a fair trial. I am very pleased indeed with the springs; they do away with all jar and shake on any ground, and prove to be all you claim for them.—Yours truly, (Signed), SAMUEL APTED.

HORSE MACHINE,  
WITH PATENT AXLE SPRINGS.

TESTIMONIALS.

Hurlingham Club, Fulham, June 13, 1895.  
I have used your Lawn Mowers for over twenty years, and find them the best. The addition of springs is a very great improvement. (Signed), WM. SUTHERLAND, Head Gardener.

Ranelagh Club, Barnes, S.W., October 13, 1895.  
On behalf of the Committee, I have pleasure in stating that your Mowing Machines, fitted with Patent Steel Springs, have been used for six months on our Golf Links and Polo Grounds, and have given the greatest satisfaction. The springs, in our opinion, are a great improvement in Lawn Mowers.—Yours faithfully, (Signed), HENRY E. RIDLEY, Assistant Secretary.

## HORSE, PONY, & DONKEY MOWERS { For Golf Courses, Cricket Grounds, Private Lawns, &c.

"THE BRITANNIA,"  
A Perfect Side-Whsel Mower.

"THE CALEDONIA,"  
Light Roller Machine,  
WITH PATENT AXLE SPRINGS.

TESTIMONIALS.

(PER BEN REID AND CO, of ABERDEEN.)

The "CALEDONIA" Lawn Mower made by Shanks, Arbroath, is one of the best I have ever tried. I got a 14-inch size, and it is undoubtedly the lightest and sweetest-working Mower in my collection.—(Signed) JOHN M. TROUP, Gardener to H.M. the Queen, Balmoral.

58, Dawson Street, Dublin, Nov. 1, 1894.

Referring to the Horse Machine supplied last season, Mr. J. Robertson, Land Steward to the Right Hon. Karl Fitzwilliam, writes us as follows:—I have great pleasure in stating that the Horse Lawn Mower has done its work exceedingly well. The Patent Springs fitted to the main axle are a great advantage, especially when the ground is uneven, as they prevent jolting and vibration of the machine.—Yours truly, (Signed), W. DRUMMOND AND SONS.

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

**CANNELL'S CHAMPIONSHIPS, BELT and £50,** for the Societies that show the Best Garden Produce.

There will be tremendous contests at Milton (Kent); Richmond (Surrey and Middlesex); Shanklin (Hants and Wilts); Leeds (York); Brentwood (Essex and Herts); Barrow-in-Furness (Lancashire and Cumberland); the greatest fights for horticultural honours between associations in these counties ever known (Kent had fifteen entries last year), where the superiority of our Seeds and varieties certainly will be made unmistakably plain. Milton, in 1894, increased their funds, cleared off debts, and presented £9 to their Hospital. Send for full particulars. SWANLEY, KENT.

**LARGE PALMS & DECORATIVE PLANTS.** Immense Stock.

All sizes up to 20 feet for Sale or Hire. Inspection Invited. Prices on Application. R. S. WILLIAMS AND SON, Victoria and Paradise Nurseries, Upper Holloway, London, N.

## SALE OF ORCHIDS.

By order of Messrs. F. SANDER &amp; Co., St. Albans.

A great variety of IMPORTED ORCHIDS, including—

A fine consignment of the rare and lovely DENDROBIUM SANGUIOLENTUM.

GRAMMATOPHYLLUM MEASURESIANUM.—Flower-scapes several feet in length; flowers 3 inches across, bright green, profusely marked with chocolate and purple.

A CYPRIPEDIUM sent home by collector as C. species, with white pouch, like nivenum or leucochilum. The plant is in excellent condition, sturdy growths, with plump leaves, in full vigour.

OATLEYA PUMILA, the finest type of this highly ornate species.

An ORCHID SPECIES from the Bismarck Archipelago—most extraordinary-looking plants. Believed to be an entirely new genus. The pseudo-bulbs are pyramid-shaped.

CYPRIPEDIUM INSIGNE VAR., from Hills in Bhotan.—Very distinct-looking plants, exhibiting great variation in the foliage; many novel forms are anticipated, as it has been imported with—

A CYPRIPEDIUM SPECIES, with small, succulent-looking leaves; the smallest-leaved kind we know of. No plants have ever before been collected in these mountains.

CATTLEYA LABIATA, GARDNER'S VAR.—A few grand specimens specially sent home by our collector from Gardner's territory; this plant is now very scarce in Portocara.

VANDA CERULRA.—Splendid plants, from the district which has yielded the most noted varieties.

CYPRIPEDIUM HOKALII ATRATUM (?), grand lot of imported plants.

DENDROBIUM WARDIANUM GIGANTEUM.—The gigantic Upper Burmese types, the finest and largest-flowered of all.

Together with

PLANTS in FLOWER or BUD, and many RARE and CURIOUS ORCHIDS.

Also Two grand plants of CYMBIDIUM LOWIANUM, having 180 and 300 flowers respectively.

TO BE SOLD BY AUCTION BY

MESSRS. PROTHEROE AND MORRIS at their Central Sale Rooms, 87 and 88, Cheapside, London, E.C., on FRIDAY, April 24, 1896, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

Tuesday Next, April 21.

McKAY, Patentee and Sole Agent, King Street, Dunstable.

LETHORION (Vapour Cone) PATENT.

The total destruction of Insect Pests in Greenhouses is thoroughly secured without the slightest possible injury to Flowers or Plants of the tenderest kind. It CANNOT fail where the houses are secure. Red Spider, Scale, and Mealy Bug can be easily eradicated by doubling the Cone power.

PRICES: For frames, &c., of 50 to 100 ft., 6d.; 500 to 700 ft., 9d.; 1,100 to 1,500 ft., 1s.; 4,000 ft., 3s. 6d.

The public are cautioned against imitations in various forms at less cost, as they have in most instances proved to be worthless articles, totally unequal to Lethorion in strength and effect. MANUFACTURERS—

CORRY & CO., Ltd., LONDON. To be obtained from all Seedsmen and Florists. GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 18 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d. GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., with the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

**STANDARD CHAIN MACHINE,**  
WITH PATENT AXLE SPRINGS.

**TESTIMONIALS.**

Lord's Cricket Ground, London, June 15, 1894.  
I have used your Lawn Mowers for over twenty years, and have no fault to find with them. I consider them the best in the market, and they are the only machines we use here. The addition of the springs to our 48-inch Mower is a great improvement, and the Machine works with great ease and smoothness. I consider you have made a good hit. Yours truly, (Signed), PERCY PEARCE, Ground Supt.

Surrey County Cricket Club, Kennington Oval, London, April 3, 1894.

I have given our large Machine that you fitted with your Patent Springs a fair trial. I am very pleased indeed with the springs; they do away with all jar and shake on any ground, and prove to be all you claim for them.—Yours truly, (Signed), SAMUEL APTED.

**HORSE MACHINE,**  
WITH PATENT AXLE SPRINGS.

**TESTIMONIALS.**

Hurlingham Club, Fulham, June 13, 1895.  
I have used your Lawn Mowers for over twenty years, and find them the best. The addition of springs is a very great improvement. (Signed), WM. SUTHERLAND, Head Gardener.

Ranelagh Club, Barnes, S.W., October 13, 1895.  
On behalf of the Committee, I have pleasure in stating that your Mowing Machines, fitted with Patent Steel Springs, have been used for six months on our Golf Links and Polo Grounds, and have given the greatest satisfaction. The springs, in our opinion, are a great improvement in Lawn Mowers.—Yours faithfully, (Signed) HENRY E. RIDLEY, Assistant Secretary.

## HORSE, PONY, & DONKEY MOWERS { For Golf Courses, Cricket Grounds, Private Lawns, &c.

**"THE BRITANNIA,"**

A Perfect Side-Wheel Mower.

**"THE CALEDONIA,"**

Light Roller Machine,  
WITH PATENT AXLE SPRINGS.

**TESTIMONIALS.**

(PER BEN REID AND CO., of ABERDEEN.)

The "CALEDONIA" Lawn Mower made by Shanks, Arbroath, is one of the best I have ever tried. I got a 14-inch size, and it is undoubtedly the lightest and sweetest-working Mower in my collection.—(Signed) JOHN M. TROUP, Gardener to H.M. the Queen, Balmoral.

58, Dawson Street, Dublin, Nov. 1, 1894.  
Referring to the Horse Machine supplied last season, Mr. J. Robertson, Land Steward to the Right Hon. Earl Fitzwilliam, writes us as follows:—I have great pleasure in stating that the Horse Lawn Mower has done its work exceedingly well. The Patent Springs fitted to the main axle are a great advantage, especially when the ground is uneven, as they prevent jolting and vibration of the machine.—Yours truly, (Signed), W. DRUMMOND AND SONS.

## HAND, HORSE, OR PONY ROLLERS, FOR GARDENS, PARKS, GOLF GREENS, &c.

TESTIMONIAL—

"World's Columbian Exposition,  
 Chicago, October 16, 1893.  
 "Gentlemen,—I desire to state that we have used the  
 'Pennsylvania' Lawn Mowers almost exclusively during the  
 progress of the Fair, with the most satisfactory results. The  
 ease in working them was remarkable, and they did more work  
 than we supposed was possible for Lawn Mowers to accomplish.  
 The appearance and condition of our lawns, in comparison with  
 others, prove the high grade and superiority of these Lawn  
 Mowers.—A. B. FARQUHAR, Executive Commissioner."

WESTONBIRT.

**THE** fine Gloucester-hire estate of Captain  
 Holford has been long celebrated for  
 its magnificent mansion, with its elaborate  
 appointments, even to the smallest matters of the  
 enormous estate and its administration. The  
 late Robert Stayner Holford, the father of the  
 present owner, found his greatest pleasure in  
 Westonbirt, and the chief delight was found in  
 adding to its beauty and to the comfort of the  
 large number of persons employed on the  
 estate. The gardens, as might be expected,  
 came in for a large amount of attention, and  
 every novelty in plants found a place out-of-  
 doors or in the glasshouses.

The garden contained one of the earliest and  
 best-grown collections of Orchids, and Hippe-  
 astrums were among the first taken up and  
 hybridised in a consistent manner, and on a  
 large scale. Here grew uncounted plants,  
 such as *Solandra grandiflora*, which often  
 carried over 200 of its large trumpet-shaped  
 flowers at a time, as they have not been  
 observed to do before or since. It was, how-  
 ever, in the pleasure-grounds that much was  
 done in beautifying a naturally-delightful land-  
 scape, and here Mr. Holford found scope for his  
 refined taste in scenic effects. In everything  
 that was carried out, the great idea was that it  
 should harmonise with its surroundings, and that  
 no abrupt transitions should occur, for he held the  
 opinion that gardens, pleasure-grounds, and the  
 pastures and woodlands, should merge the one  
 in the other without visible dividing lines. In  
 the furtherance of this view, was formed the noble  
 arboretum, in which a very complete collection  
 of trees and shrubs of all kinds is to be found,  
 and of which we hope to give illustrations.  
 It extends over 4 miles in length, enclosing  
 and combining the entire series of gardens and  
 pleasure-grounds. Viewed from the high ground  
 around the mansion, the garden scenery is very  
 delightful, the whole of the trees and shrubs  
 having been carefully arranged and planted so  
 that the deciduous and flowering kinds should  
 have at all seasons the foliage of evergreens  
 around and near them. Away in the near fore-  
 ground, beneath a few stately trees, and in the  
 natural turf, are spring-flowering bulbs, hardy  
 Cyclamen, Daffodils, Gentians, and Anemones,  
 producing a wealth of flowers in their season,  
 which are all the more lovely from growing in  
 a natural manner. On one hand is the chain  
 of pretty rockeries, with their undulating and  
 winding walks, leading among pretty alpenes  
 and rare shrubs to the ornamental lake, whose  
 banks are embellished with Bamboos and other  
 plants of a tropical aspect. On the other hand,  
 and beyond, are numbers of groups of rare  
 shrubs, many of which are already in bloom.

among which are the Magnolias, and especially *M. stellata*; the early *Berberis*, *Forsythias*, and the Moutan *Pæonies*, which here bloom most profusely, in situations where they are sheltered from the winds, are, or have been, finely in flower. Here, too, the Japanese Maples are largely and effectively used, and later in the season their pretty and variously-tinted foliage gives a telling feature not otherwise to be obtained.

The chief element of success with these Acers, and also with the other kinds which are wanted for their charming autumn tints, is to see that they are copiously supplied with water throughout the month of July. On the low terrace-wall the different varieties of *Pyrus japonica* are covered with bloom, the pure white one and *P. japonica* *Simonsi*, which is of a dark blood-red tint, being among them; and beneath these are some charming tufts of *Myosotis dissitiflora*, which were self-sown in a sunny aspect, and not exactly where they would be expected to thrive, and become masses of blue flowers as they now are.

Passing along the terrace and beneath many a noble tree, such as *Liriodendron tulipiferum* and other flowering trees, some of which were among the first specimens of their kind planted in Europe, we come to the geometrical garden with its terraces, alcoves, colonnades, and fountains. Here, in the front portion, the beds were formerly used for carpet-bedding, but are now planted with herbaceous perennials, plants which are in contrast to the bedders, continually making a show. At the back of and bounding the range of plant-houses is a raised terrace with a high wall, against which rare climbers are planted. Some of them have been there for over forty years, and their beauty of flower and foliage has increased with age. Here is one of the earliest, *Berberis pinnata* (*fascicularis*), with Fern-like glaucous leaves; seedlings of which have been raised, but the young ones always come with plain green leaves. Do they need great age to develop the glaucous hue? The Magnolias, *Ceanothus*, &c., are beautiful here in their season, and in summer the border beneath them has hundreds of heads of bloom of *Amaryllis Belladonna*, whose bulbs have not been disturbed for many years; and the face of the raised stone-edged border is covered with *Verbenas*, and presents a sight rarely seen. At one end a plant of *Choisya ternata* is well in flower, and many other pretty objects appear.

#### THE GLASSHOUSES

have been either re-built or modernised under the practical superintendence of Mr. Chapman, the able gardener at Westonbirt, who is now an old servant, and one who takes a thorough interest in his work. In Mr. Lindsay, the agent of the estate, he is fortunate in having a gentleman who likes and understands gardening, and is, therefore, always ready to forward any works of improvement.

The Orchid-houses have in times gone by contained a rich collection, and many very large specimens, among which the original plant of *Saccolabium guttatum* Holfordii often bore a score of spikes, each from 3 to 4 feet in length; *Aërides odoratum* was represented by plants with a dozen leads, and bearing in their season three or four dozen racemes of flowers; *Renanthera coccinea*, and others now seldom seen, flowered in abundance, and many others, chiefly of the large-growing kinds, as was invariably the case thirty or forty years ago, attained proportions and beauty now seldom approached, although Orchids, as a

class are far better grown now than then. But with the demolition of the old mansion, and in the interval before the new was available as a residence, one after another of the good things vanished or declined, and the culture of Orchids which is again being taken up vigorously and intelligently by Captain Holford is of the more modern style. There are now a house of *Odontoglossums* and one of *Masdevallias* which are thriving satisfactorily; a good house of *Cattleyas* and *Lælias*, a house of *Cypripediums*, in which the centre bed is occupied by Ferns and foliage plants, which seem to have a healthful influence on the *Cypripediums*, which are growing and flowering well; and houses of *Dendrobiums* and Miscellaneous Orchids.

In one warm house the plants of *Dendrobium Phalænopsis Schroderianum* are very fine, and the varieties of *D. nobile* in flower; also a number of plants of a singular strain of *D. infundibulum*, in form like that known as *D. Jamesianum*, but with a light yellow instead of a Roman-red disc to the lip. Suspended here is a strong plant of *Saccolabium ampullaceum*, which has been many years at Westonbirt; and a noble plant of *Cypripedium Stonei* is about to flower. On one side are numbers of flowers of *Cypripedium Lawrenceanum*, *C. ænanthum superbum*, *C. × Leeaanum superbum*, and others; and at one end are suspended some fine *Dendrobium Wardianum*, whose flowers make a great display; and in the *Cattleya* and *Odontoglossum*-houses there are good things in bloom, and a great promise of flowers on *Lælia purpurata*, *L. crispa*, and the larger *Cattleyas*.

(To be continued.)

## ORCHID NOTES AND GLEANINGS.

### THE DELL, EGHAM.

ONE of the most beautiful displays made by one genus of Orchids is that consisting of *Dendrobiums*, to be seen at the present time in Baron Schroder's garden at The Dell, Egham. The plants have been collected into one of the large spau-roofed houses, which they fill from end to end, being arranged on the side and central stages. The entire area of the roof has also its floral burden, which sends down long graceful sprays among the plants below, and forms arches over the walks on either hand. Probably *Dendrobiums* have never been seen elsewhere finer than they are at The Dell this season; and although for a long time past a large number of species have been in flower, some leading feature has always predominated; and the large, well-flowered specimens, first of one species and then of another, seem to give "body" to the artistical display. Earlier in the year it consisted chiefly of the varieties of *D. × Ainsworthii*, *D. × splendidissimum grandiflorum*, and others of that class, succeeded by *D. nobile* and *D. Wardianum* as leading species; and now that many of these are on the wane, the telling specimens consist of the beautiful *D. × Dellense*, whose wax-like white flowers are tipped with pink, contrasting with the maroon base of the lip. Some of the varieties have a pale-primrose shade, some a delicate blush, and all are compact in growth, floriferous and beautiful. Many of the plants of *D. × Delleuse* are in great beauty, and they are associated with fine examples of the true *D. nobile nobiliss*, the richest coloured of all the varieties of *D. nobile*; and with *D. n. Schroderianum*, the best white, which is equally good. Other fine *Dendrobium nobile* in bloom are *D. n. Cookei*, *D. n. Sanderiana*, *D. n. Wallichii*, *D. n. Ballianum*, and a grand specimen of *D. n. elegans*, which, like *D. n. nobiliss*, is one of the oldest and best varieties. Among new, unnamed forms, is a very peculiar *D. nobile*, with white flowers, the tips of whose petals are tinged with brick-red; and among

allies of *D. nobile*, *D. × Rolfæ* was remarked as being very pretty.

In the groups consisting chiefly of fine plants of *D. Wardianum* and *D. crassinode*, are two forms of a pure white-flowered *D. Wardianum*, and one of a white *D. crassinode*; also *D. × melanophthalmum*, the very beautiful natural hybrid of the two species above-named. Among other beautiful plants noted in more or lesser numbers were *Dendrobium superbum* *Dearei*, white; the *D. s. Burkei*, blush-white; and the typical *D. a. giganteum*, *D. Falconeri*, and *D. F. giganteum*; fine examples of *D. Findlayianum*, *D. Harveyanum*, with curiously fringed petals; and the bearded *D. Brymerianum*; that prince of hybrids, *D. × micans*, with white and clear purple flowers, having the appearance of delicate china; the yellow *D. fimbriatum*, and the dark-eyed *D. f. oculatum*, in large masses; the delicate white small-flowered *D. barbatulum*, and the pretty *D. l. crepidatum* *labello-glabro*; the singular *D. chryseum*, which promises so well in bud, but which invariably close-fertilises; *D. × Dulce*, and several of a similar and better hybrid, raised at The Dell; *D. Devonianum* in fine specimens, seeming to send forth showers of bloom; *D. Farmeri*, *D. × eousum excellens*, *D. × Cordelia*, *D. × Aspasia*, *D. × Alcippe*, and a host of other classic crosses, whose beauties are effectively displayed by Mr. Ballantine, the Baron's head gardener. Another large house has a group of *Calanthes*, principally the later-flowering *C. Reguierii*, and the very beautiful unrivalled hybrid *Calanthe × Baron Schroder*, raised at The Dell, and whose large dark crimson-purple flowers it seems impossible to improve upon.

Here, too, is a good show of *Cypripediums*, among which *C. Mastersianum*, with its bold, wax-like, yellow and Indian-red flowers, stands out prominently. The famous *C. Stonei platytænium*, *C. callosum Sanderæ*, and *C. Lawrenceanum Hyeaanum* are again sending up flowers. Among good varieties in bloom are *C. × Gertrude Hollington*, *C. × Antigone*, *C. × porphyrochlauns*, *C. × Harrisianum superbum*; some very fine *C. Rothschildianum*, *C. Chamberlainianum*, &c. In this house were remarked the singular-looking *Epidendrum pseud-Epidendrum*, with orange-scarlet coloured lip; the handsome *Ansellia africana picta*, some well-flowered plants of the white *Angræcum modestum*, a number of plants of the beautiful Indian-yellow hybrid raised at The Dell—*Lælia vitellina*; the rare, bright blue *Utricularia Humboldtii*, which here does well in a warm Orchid-house; and *Schomburgkia tibicinis* brought close up to the highest point of the roof, is sending up flowers.

In the *Nepenthes*-house, the *Vanda teres* are doing in a very satisfactory manner, and about 120 flower-spikes have already appeared. The blush-white *V. teres Aurora* flowers at The Dell almost continuously; and *Vanda teres gigantea* has a noble spike of very large flowers, as denoted by its name—the colours of this variety are rich and brilliant, and in form it is perfection.

Among the *Odontoglossums* there is a fine show already, although the best have yet to come. In the house containing the bulk of the collection are many superb forms of *O. crispum*, *O. Wilckeianum*, *O. × elegans* in two very distinct forms, *O. triumphans*, of which *O. t. Hillington* is the best; varieties of *O. Andersonianum*, the rosy-lilac *O. Cervantesii* *lilacinum*, the pretty snow-white *O. Erstedii*, *O. luteo-purpureum*, &c.

Of the spotted *O. crispum*, *O. c. Owenianum*, is the finest in bloom at the present time, its large flowers of fine form, and the cinnamon blotches on the sepals possess a peculiar hue, owing to the purple tint at the back being visible on the face. Bright colour is afforded by fine specimens of *Sophrontis*, *Ada aurantiaca*, and *Mesospindium vulcanicum*; and variety of form by the pure white, roman-red-lipped *Dendrobium Jamesianum*, which here thrives with the *Odontoglossums*.

In the *Cattleya*-house the passing flowers of the *C. Trianei* are replaced by the charming, fragrant *C. Schroderæ*, a form of *C. labiata*, which is always good, and sometimes charming. Many distinct forms are

found at The Dell, but all have to give place to the latest novelty there, viz. *C. Schroderae alba-aurantiaca*, a delightful large-flowered, soft white form, possessing a rich, deep orange-coloured central patch on the lip, through which a delicate tracery of fine silvery lines is seen. It is difficult to imagine a more beautiful white *Cattleya*, although it is closely approached by The Dell form of *C. labiata Wagneri*. In one corner of this house is a huge specimen of *Sobralia macrantha*, covered with large purple blossoms; balanced on the other side by the fine yellow *S. xantholeuca*,

and much beauty in some of the species usually denominated "botanical"—a very good example of which is found in a perfect plant of the yellow and chocolate *M. triangularis*.

It is pleasant to view so fine a collection, the supremacy of which has for many years been so liberally maintained. Baron Schroder is attached to his plants, interesting himself in every detail of their requirements and culture as carried out in other departments of his garden by his gardener, Mr. H. Ballantine.

FIGS ON OPEN WALLS.

In many parts of the country it is useless to plant the Fig against open walls, in some cases owing to adverse climate, in others to unsuitable soil, in which the trees produce wood freely, but fail to fruit. In the west and southern parts of the country the Fig fruits well; and in Sussex, even from dwarf standard, or bush trees, good fruits are obtained. In such cases there is usually an abundance of chalk in the soil. In favoured situations the Fig is certainly not fastidious as to soil, but the best results are obtained from a calcareous loam on a chalky sub-soil. Much depends also upon the variety chosen for open-air culture. If the most suitable variety is planted on favourable soil, there need be no lack of fruits of good quality if proper attention be paid to the stopping of the shoots during the growing season, and to removal of gross wood.

If the important work of stopping during growth is attended to, there will be little pruning necessary at this season, which is of advantage, as the trees are not benefited by the use of the knife freely at one season. There are bushes or dwarf standards at Syon which were planted with a view to test their usefulness as fruit bearers in the open, but as they failed to produce fruit, have been allowed to grow naturally. They have never been injured by frost, nor do they fruit, but an abundance of wood is produced, proving that it is necessary to prune hard at certain seasons. To grow trees under such conditions the soil must be suitable, and promote fruiting wood in the place of rank leafy growth. There are many fine bushes in the centre of London which make excellent growth yearly, and being deciduous thrive well, but such trees do not fruit. Trained trees suffer more from the weather, and they need protection. In most gardens where trees are grown on walls, it is necessary to protect them, and the most simple method of doing this is to tie the branches together in bundles, and cover well with dry fern, straw, or even moss, which should be removed early in March if the weather is open. The portions needing protection most are the points of the shoots, the lateral growths proceeding from the main branches, or the portion stopped to give fruit the next season. In such a winter as we have just passed through, the trees have actually needed no protection, but it is best to be prepared each season in case of a severe one. One often sees old trees with thick branches, and a very small quantity of fruiting-wood. Such trees are most difficult to protect and there is no need of so much useless wood. No matter how old the trees are, by timely attention to thinning, good wood may be obtained in them if the trees are allowed a wide spread. In the case of most fruit-trees, I am an advocate of seasonable root-pruning, but especially so in the case of the Fig. Few trees are so barren when left to chance, and by root-pruning, the excessive use of the knife on the branches is avoided.

If a young tree is planted, it should be cut back fairly hard after the tree is established, and the following season it will produce a number of strong shoots, which should be trained close to the wall, at distances of 2 feet apart. In the late autumn these will require to be tied in bundles, and may be taken from the wall and well protected, and the following season these main shoots will produce lateral growths freely. A few of the strongest should be encouraged to grow from the base, and the others may be stopped when they have made 3 or 4 inches, always allowing sufficient wood to run to form leaders to replace older ones. By such treatment there is little winter-pruning to be done, and as the fruits of one season are formed in the wood during the previous autumn, it is obvious that the wood should become thoroughly matured. To this end thin freely during growth, to admit as much light and air as possible. Although new wood will often show abundance of fruit, in very rare cases only do they mature. The large Figs seen on the points of shoots late in the autumn are useless, and will never mature.

Root-pruning is best done at this season, and in the case of barren trees in soils deficient of chalk or

FIG. 73.—RICHARDIA, ON LAKE SIDE, AT TRELISSICK.

about to afford its annual display of blooms; and among others in bloom are *Laelia* × *Latona*, several fine *Cattleya Lawrenceana*, *C. amethystoglossa*, and *C. citrina*.

In the intermediate-houses, a good show was noted of *Vandas*, *Lycaste*, &c., *Oncidium spillopterum*, *O. Lucasianum*, *O. sarcodes*, *O. Marshallianum*, *Maxillaria Kimballiana*; some strong specimens of *Cymbidium Devonianum*, the dark form with two, and the light-coloured with three long pendent racemes; *Trichopilia suavis* and *T. s. alba*, *Oncidium Loxense*, *Epidendrum* × *Dellense*, *E. xanthinum*, *E. x O'Brienianum*, &c. In the Masdevallia-house a brilliant display is already to be found among the showy species

VIEWS IN THE GARDENS OF TRELISSICK.

It will be within the cognisance of our readers that several views in the charming gardens of the Hon. Mrs. Gilbert, at Trellissick, Truro, have been given in these pages during the past and present years; and in the present issue we give our readers two different views of the lake, which illustrate distinctly different types of vegetation. In the Supplementary Illustration, we have *Gunnera scabra*, *Gynerium*, and other robust plants, forming a noble foreground; and in the other (fig. 73), a large plantation of *Richardia aethiopica*, apparently quite at home in the water.

lime, these latter may be added when the trench is re-filled, after cutting the coarse roots. Failing lime-rubble or broken chalk, the addition of wood-ashes is beneficial. The roots should be kept near the surface, and be well supplied with moisture and food during the time the fruits are swelling. For a top-dressing for trees bearing freely, I have found bone-meal mixed with good loam and wood-ashes an excellent food. It does not foster a rank growth, but encourages the formation of fruits for the following year's crop. Excess of manures will cause the fruits when swelling to turn yellow and drop.

Of varieties best suited for outside culture, I think Brown Turkey is difficult to beat. Brunswick is also very suitable: it produces a large fruit, and is one of the hardiest varieties grown, but I do not think the flavour of the fruit equal to Brown Turkey. Whits Marseilles is also much used for the purpose, but though hardy and very early, it lacks the rich quality of the two first named; the fruit is more juicy, and has a pale flesh. Lee's Perpetual is a grand outdoor variety, but I see little distinction between this and Brown Turkey. The Black Ischia does well in sheltered places, but the fruit is small. Dwarf Prolific is also very fine and an abundant cropper, nor is the growth so coarse as some. I have not yet given the newer kinds, such as St. John's and Pingo de Mel, a trial in the open, but I intend doing so, and should think they will be most prolific, as the St. John's is noted for its heavy first crop. So far, however, I have found the yellow-fleshed varieties less rich on walls than the dark ones. *G. Wythes.*

### MARKET GARDENING UNDER DIFFICULTIES.

OUR "colonies and possessions" exhibit some wonderful things in the way of market and amateur gardening, as all who have travelled with open eyes can readily vouch. Canada used to furnish a fine show, and so also to-day do both Australia and New Zealand. However "curious" may be such exhibits, they in some part show how it happens that Britishers make the best of colonists—they leave nothing untried where hard work is necessary in order to achieve success. The Scotch contingent of emigrants are well to the front in the colonial battle of life, and the few accompanying paragraphs will help to prove the soundness of my proposition. Friends of mine years since went forth to Sydney, New South Wales—father, mother, and some little children. The struggle was a hard one, but all fared well, the parents a few years since making preparations for returning into private life, with a fine piece of land for garden, orchard, and farm. The monetary crisis came, banks went down, but some pounds were saved from the wreck, and the land on which the house had been built. To-day the parents are years on the wrong side of sixty years old, but their pluck is of the highest class, and, with robust health, and indomitable energy, misfortune is allowed to pass idly by them. The first ten years of farming and gardening were comically woful failures. Of last year's results I give the following extract from a letter just to hand:—

"We have had no rain for a whole year, and the heat this summer has been terrible. Our winter crop of Peas was cut down with frost, the Potatoes eaten up with wireworm; our best Christmas Peas, which should have set us on our feet, were burnt to the ground, so with the Beans; and as for Cabbages, they were nothing but gauzework with the grubs, although we doctored them with all sorts of things. And now our Tomatoes have gone; I put in about 1000 plants, and they have produced nothing but pigs' food. We have had a shower or two lately, which have revived the plants a bit, but out comes the scorching sun again, and does more damage. Now, who wouldn't be a farmer? But we never say die. We have been advised by men who do know something about it, to grow Passion fruit (? *P. edulis*), some are going in earnest for them. They grow in any sort of soil or weather. We have a few now in full bearing, and we have made a little out of them this season. They bear twice a year, and we are told by our adviser, that a friend of his makes

£200 a year from half an acre. According to the yield of our plants we can well believe it, so we are going to have a try anyway. It is 'Never venture, never win!' All the failures in vegetation were turned into pork, chickens, ducklings—the pigs being of a fine Yorkshire breed—ducks, drakes, and the fowls being stocked from home importations: these have all succeeded well, with the help of the artificial mother. This latter has afforded fun as well as profit, and the balance-striking for the current year is looked forward to, as usual, with great hopes. By the way, a couple of wells were sunk in such places as would save cost of irrigation. Shortly after these were completed, water had been reached, a force-pump was got ready, but never a bucket of water has been brought to the surface from that well. Some one had tapped the strata at a deeper level, and won the fluid. Going a little deeper may probably result in success; meanwhile the horses run the sleigh-like water-cart to the not far-off gradually drying up stream, which will by-and-by get to be bank-full, and all, I trust, once more go merrily on." *E. C.*

### FLORISTS' FLOWERS.

#### THE GOLD-LACED POLYANTHUS.

IT is stated on authority that the classes for gold-laced Polyanthus have been struck out of the Schedule of Prizes of the National Auricula and Primula Society, the annual exhibition of which is to take place on the 21st inst. Fancy an exhibition held by a so-called National Society with one of the principal sections of the Polyanthus left out! Why is this?

Years ago, when my brother and myself put in a strong plea for a better recognition in the schedule of the coloured Primrose, and the improved forms of the Giant Polyanthus, we were told they were not recognised by the florist, notwithstanding that collections of them were the most attractive feature in the whole exhibition. Eventually the value of the prizes was slightly increased, but only after a persistent insistence of the value of their claims. Now the irony of fate decrees that the gold-laced type—the one the florist has recognised for a century past—is to go; and the Giant or Fancy type—once frowned upon—reigns supreme.

It will be said that the gold-laced Polyanthus has not been well represented at the exhibitions of the Auricula Society of late years, which is largely true; the main reason being that the choice named varieties have been generally past their best when the show was held. It should be borne in mind by the committee of the Society that the named varieties are very few and very scarce; and they thus admit of but a very small selection of plants to exhibit, the choice being very restricted. But some of us, and Mr. A. J. Saunders of Brockham in particular, have endeavoured to our utmost to keep the gold-laced section prominent—always showing the best material at our command. They have been as well represented at past exhibitions as the double Primroses, but one is taken and the other left.

By striking the gold-laced section out of the schedule, any encouragement to raise new varieties by means of seed is removed. The named varieties are so scarce, and some of them appear to grow more weakly, and therefore scarcer year by year, that there is urgent need for encouragement being given to raisers of seedlings; but awards to seedling gold-laced varieties are also withdrawn from the schedule. To say that the gold-laced Polyanthus cannot be grown in a satisfactory manner, is to beg the question. At the present time I have, in my garden at Ealing, over 200 seedling plants of this section, all planted out in the open, some two and three years old; the others are yearling plants, flowering for the first time. They are blooming with remarkable freedom, and they are in not a few instances of decided quality; and I am finding this season there are more enquiries for seed of gold-laced Polyanthus than I have ever known before, which shows that the type is being sought after, even for spring bedding. I once more

express my regret that the gold-laced section is being tabooed by the Society, whose aim it should be to encourage the development of every section of the genus *Primula* which blooms in April. I hope that other growers of this refined gold-laced type will join me in entering a protest against its elimination from the schedule of prizes of the National Auricula Society. *R. D.*

### SIREX GIGAS, AND OTHER INSECT PESTS OF CONIFERS.

MUCH diversity of opinion appears to exist respecting the destructive capacities of the *Sirex gigas*. I have just received a communication from a friend, who states that this insect has appeared in large numbers on the estate with which he is connected, and fears they will do great damage to his plantations. I do not think my friend, or any other forester similarly circumstanced, need have much apprehension as to the depredations of this insect.

In my opinion, the appearance of either *Hyllobius*, *Abietis*, or *Hylurgus piniperda* in a plantation is much more to be dreaded than the *Sirex gigas*. The destructive capacities of the former have been so much descanted upon, that they need not be recapitulated here; but it is well known that newly-planted-out trees have no chance whatever against them; indeed, I have seen well-established trees from 6 to 10 feet high succumb to their attacks. The *Hylurgus piniperda* is equally if not more destructive to Fir plantations.

I, however, cannot say that I have ever seen a plantation of which I had charge injured by the giant *Sirex*, though I have seen them in great numbers in conjunction with the Tortrix moth, Pine saw-fly, Fir-weevil, &c., in plantations in the south and other parts of Ireland. One of these plantations was infested with the insects mentioned for five or six years, and as may be imagined, a great many of the trees were destroyed by them, but we could find no traces that the trees had been injured by the giant *Sirex*.

The two principal offenders were the Fir-weevil and Pine boring-beetle, whose depredations were more injurious to the trees than all the others combined.

The most congenial haunts of the giant *Sirex* are in partially-decomposed stools and trees, and wherever timber of this kind exists, the larvæ of this insect are sure to be in evidence. In fact, during my somewhat extended experience of this insect, I have never seen its larvæ on a living tree, though I have seen both felled and standing dead trees literally honeycombed by them.

It is a good many years ago now since I first observed that this insect prefers this description of timber to any other for propagating purposes. Preparatory to planting a large tract of old woodland, and in addition to other precautions, I deemed it expedient to examine the stools in it, to see whether there were any of the beetles that had been seen in it some years previous to that time. We examined a great many of the stools which were half rotten, and in almost every one of them we found the larvæ of this beautiful fly.

Previous to this plantation being cut down, it contained hundreds of dead trees, nearly all of which bore traces of the workings of this insect, and it was no doubt from them that so many were found in the decayed stools. A younger part of this plantation, and perfectly healthy, was left standing for many years afterwards, but not a tree in it so far as I could see was injured by the larvæ of the giant *Sirex*.

From my experience of this insect, therefore, I feel justified in saying that it is not a very formidable plantation pest, seeing that it almost invariably deposits its eggs in timber which is of little, if any, commercial value. The maggots of this insect are of a dirty white colour, and at this stage of its existence it is said to be destructive.

The fact of the *Sirex gigas* selecting dead or decaying timber in which to deposit its eggs may lend some colour to the theory put forward by some, that only weakly and diseased trees are attacked by insects,

and that vigorous-growing healthy trees are exempt from their attacks. It does not follow, however, that all the insects which infest our plantations have the same predilections as the insect in question. The Fir-weevil, for instance, has no such powers of distinction, and will attack the vigorous growing tree as readily as the weak and diseased one. This is no mere assertion on my part, as I could cite many

dently forgot, when recommending his so-called preventative that this insect has other means of locomotion besides its legs, and if it could not surmount the obstacle—if obstacle it could be called—with the latter, which I do not admit, it would have no difficulty in surmounting it with the wings, with which Nature has provided it. *David Robertson, Hoole, Chester.*

### THE ROSARY.

#### THE INFLUENCE OF EXHIBITIONS ON THE CULTURE OF THE ROSE.

THERE are a good many persons who for one reason or another look askance upon exhibitions, or at least exhibitions for competition, either for the

FIG. 74.—ERICA CODONODES: FLOWERS WHITE.

(A, flower, magnified five times; B, vertical, and C, transverse section of flower; D, pollen-grain, magnified 330 times.)

proofs in support of my statement—proofs, I may state, that are beyond cavil or question.

The theory alluded to is about as absurd as the remedy recommended by a well-known deceased forester for preventing the Fir-weevil attacking newly-planted trees. The method recommended was to place a thin layer of soil round the neck of the tree to the height of 3 or 4 inches above the level of the surrounding ground. This, he stated, would prevent them from reaching the trees; but he evi-

### TWO SPRING-FLOWERING SHRUBS.

THE two shrubs of which we give illustrations, figs. 74, 75, are often sent to us for naming at this season, which is an indication that they are not so well known as they should be. The Erica is charming from the profusion of white or rose-coloured flowers it produces, whilst the Nuttalia is a deciduous rosaceous shrub, with unisexual white flowers in clusters, as in a Ribes. Both are hardy, and from the time at which they bloom are specially acceptable.

sake of money or medals. If exhibitions are to be held at all, they say, why cannot people bring their productions together for the pure love of flowers, and to gratify other people? It is said by some to lead to dishonest practices, and to give a fictitious idea of the character of the productions exhibited. You see, for instance, a magnificent bunch of Grapes, but you are not told that the Vine only produces a couple of them; or a huge bloom of Chrysanthemum, which is the only one the plant bore; or a grand

bloom of a Rose, which is the sole production of the maiden plant from which it was cut, and you are left to infer that probably the plant has grown a couple of dozen of such blooms; and you are asked, must not all this be very injurious to Rose culture? I say advisedly, no, and I do so after an experience of many years. It is all very well to sneer at fat Roses, but I fancy most of these caustic gentlemen who do so, would be very glad if their own gardens would produce something of the same sort; and as to exhibitions without awards of any kind, there is such a thing as human nature, and consequently there will be always a hankerlog after decorations and awards. It may, indeed, suit the interests of nurserymen and trade growers to send their plants where they will be seen of many, and so obtain orders, but this is very much of the same principle, and leads to the same conclusions. I think that in every way exhibitions have materially advanced the love and culture of the Rose, and I think this can be easily proved in the records of our great National Society. It has now been established for twenty years, and in order to bear out my contention, let us see what was the condition of the Rose in 1876 compared with what it is in 1896. In those days the number of exhibitors was very small; there were a few leading nurserymen, whose names will be long cherished, and one of whom (Mr. B. R. Cant) remains as an exhibitor to the present day. The amateurs were also very few in number, and perhaps hardly one of them (not even Mr. Hedge of Colchester) entered so largely into it as our leading amateurs of the present day. The exhibitions were very few and almost exclusively confined to the Metropolis, and the quality of the flowers was, as a rule, very inferior; while of that universally popular and most beautiful section, Tea Roses and Noisettes, there were but few representatives. Then, too, the vicious principle of making a Rose show last two days or more was generally adopted, and we who know what Roses are at the end of one day, can faintly imagine what they must have been at the end of the second day.

In contrast to all this, let us see what the present state of exhibitions is: one of the first principles of the National is, that no Rose show shall last more than one day. During the past twenty years Rose societies have sprung up all over the country, and while some of them have had but a fleeting existence, only lasting for a few years, others hold on their way in spite of adverse circumstances; and while some drop out of the race every year, others are found to take their place. As far as the number of exhibitors is concerned they have multiplied a hundredfold; those of the great national tournament held at the Crystal Palace numbering from 100 to 120. During the same period an increased interest in the culture of the Rose has led to the introduction of a number of beautiful flowers, and the knowledge that any really good productions will be eagerly welcomed and liberally paid for, encourages hybridisers to endeavour to produce novelties. I have noticed, where one of our affiliated societies has been at work for some years, you see in all the gardens around evidences of how it has helped forward the culture of the flower.

Sometimes, I know, the stiffness and formality of long rows of boxes (although they contain the most wonderful specimens of good culture) are complained of, and it is said we want something more artistic, and the production of these large Roses militates against such a result; well, be it so, we cannot have everything, and we must use other forms of Roses and other flowers if we want to give a decorative character to our shows. But I have never yet seen any attempts at decoration with Roses that are at all equal to those which can be made with many other flowers, and the competition for classes where Roses are to be arranged for effect is not very large. There is, in truth, a great difficulty in getting Roses, especially with amateurs, in sufficient quantity for the exhibition, and also in finding time to arrange them when there; but I believe most ladies would say that the Rose is the most troublesome flower to arrange, and very rarely gives satisfaction to those who use it.

Another great advantage, I think, which has accrued to the culture of the Rose through exhibitions, is the doing away with the standard Rose—not absolutely, perhaps, but to a large extent; in itself, nothing, I think, can be more ugly, and the only place where I think it is at all admissible is at the back row of a long border. Exhibitors have encouraged the growth of dwarf Roses, and as most of their blooms have been cut from these, they have testified to their advantage. While sharp and severe winters will utterly destroy the standards, dwarfs, although cut down to the snow-line, will shoot up again and give first-rate blooms; while the ease with which they are manipulated is another point in their favour. The amateur has especially by his recommendation of Roses on the Manetti or seedling Briar encouraged others in the same direction. But while many persons have benefited by Rose exhibitions, the commercial aspect must not be forgotten; one has no means of comparing what the sale of Rose-trees was twenty-five years ago with what it is now; but we do know this, that not merely have the great firms which have existed for so many years held their position, but they have largely increased their culture, so that a stock of a quarter of a million of Rose-trees is not an unique case. Beside this, growers for sale have sprung up in all parts of the country, and mostly find a ready sale for their plants—and that exhibitions have much to do with this may be easily seen by the number of persons who not only take notes of what they see, but seek out the exhibitor or his representative, that they may then and there give their orders; while the numberless articles which appear in our garden periodicals, give a careful and intelligent view of everything connected with the culture of the flower. Of late years there has been a revival of interest in what are called garden Roses, though indeed complaints have been made against the National Rose Society, that it is one simply for the encouragement of exhibitions, with a strong tendency to favour those large and massive blooms that fill up our boxes. I do not think that this is correct; the National Rose Society does not hastily strike out new paths until it sees the absolute propriety of so doing. People have gone into a good deal of wild talk upon this subject, but the National took a sober view of the case; it gradually introduced amongst its exhibitions, classes for garden Roses, and has not only increased their number in its own schedules, but has led the way in encouraging the affiliated societies to do the same. Nor must I omit to say that under their auspices Lord Pezance has yearly offered, and still offers, a silver cup for this class of flowers. But there are two things one must always remember, that most of these garden Roses bloom early, and that consequently when the great show is held the season is too far advanced to have them in perfection; most single Roses, Gallicas, Hybrid Chinas, &c., are over by the first Saturday in July, except in a very backward season. A slur has been cast upon the National because it devotes so much time and thought to exhibitions. Why not, it is said, strike out some fresh path? Why not encourage more Rose literature? Why not, for instance, translate and distribute amongst its members the celebrated French work on the Rose? None of these things will, I think, so keep up and increase the interest in the flower as the maintaining the high character of its exhibitions, and whether by its direct or indirect assistance to influence for good the future cultivation of the Rose. *Will Rose.*

#### A RATIONAL WAY OF CULTIVATING ASPARAGUS.

ASPARAGUS is cultivated on a very large scale in several parts of Belgium. The produce is estimated at millions of bundles, of which a great quantity is exported to the London markets. It is not necessary to describe the ordinary culture of this vegetable, that is now well understood; but we may allude to the practice of a Belgian Asparagus-grower, who not only grows the plant for market purposes, but also for royal tables, which require picked specimens of great size and superfine flavour.

The principal point in the cultivation of Asparagus is to plant the stock in a permeable and light soil, consequently one very sandy and rich in nutritive properties. The soil must be deeply dug, this plant spoiling in stagnant moisture. Asparagus should not be deeply buried, and in any case, especially in horticultural matters, the gardener, in everything he undertakes, must follow Nature's example. In its natural state, Asparagus grows near the surface, and the part of it used in culinary art is only the buds, which have become tender by the absence of light. In the ordinary culture of Asparagus the stock is buried more or less deeply in the soil, and consequently the plants are almost completely deprived of air—that is, a complete reversal of natural conditions. In fact, old gardeners say that in this case plants of Asparagus rise each year. This is evidently true, because such plants are trying to regain the air and light of which they are so nearly deprived by coming to the surface of the earth. There should be planted a good stock of Asparagus of the variety *A-perge d'Argentueil* on the surface of the soil, just as is done with Strawberry or Cabbage-plants. The distance apart should be 32 inches (80 centimetres) every way. The planting is done in autumn and in spring, when vegetation is showing; a mound of earth is made with soil taken from the pathways. After that is done, there are trenches between the rows of Asparagus, which are filled with a special compost prepared in advance, and composed of different manures suited to the plant, and duly amalgamated. The roots of the Asparagus plants draw nourishment from that fertilising soil, and assimilate into their tissues the abundant and useful principles necessary to fortify the stock, thus producing splendid and enormous buds. By this method, Asparagus is easily gathered. Directly a shoot appears, the soil is slightly disturbed with the fingers, and the Asparagus-bud is detached from the stock. This method of gathering is preferable to that one which necessitates using an Asparagus-knife, which very often impairs the growing shoots, and breaks those adjoining the ones cut. Pulling up the shoots necessitates the removal and putting back of the soil around the Asparagus, and is very beneficial to the health and strength of the stock, permitting the air to penetrate the hillock, and reach the base of the plant.

Directly the gathering is done, all the stocks are destroyed, and the ground levelled. The plants, left to themselves, make large and free growth, and profit by the unmanured soil scattered over them at the time of digging in the spring. They consequently become strong, and able to produce better shoots the following year. At the end of autumn, a layer of straw farmyard-manure is spread all over the Asparagus-bed in order to protect the plants against the cold. The same process is repeated each following year. *Louis Gentil.*

#### AGRICULTURAL RESEARCH.

THE Agricultural Research Association for the North-Eastern Counties of Scotland, which was originally established in 1875 under the name of the Aberdeenshire Agricultural Association, having now reached its twentieth year, has issued a short and useful record of its proceedings. The objects of the association are briefly these: (1.) To obtain reliable and useful information on agricultural subjects by means of scientific investigation and practical experiments, and to disseminate the information. (2.) To advise and aid in such way as may be deemed expedient the knowledge of agricultural science. The work is under the able direction of Professor T. Jamieson. We learn that some interesting experiments have been made upon the important question of the proper time for cutting cereal grain, and hay crops. In the case of Wheat and Oats, so long as the grain has passed the "milky stage," and become firm and compact, the value of the crop is enhanced by early cutting; but in the case of Barley, the best malting samples are always secured by allowing the grain to become fully ripe and hard. A difference is shown of 11s. 6d. per acre in favour of the "later stage," which, with the

addition of 1s. 5d. for heavier crop, is equal to 12s. 11d. per acre. In regard to hay, the facts seem to point to the propriety of cutting this crop before the clovers and grasses have reached full development. This may safely be done as the further growth for that year—up to the time at least when hay must be cut at latest—will be got in the after-growth or “after-math.”

of storing is almost imperative in economical farming. On the whole, the best plan for storing appears to be as follows: Towards the end of November to pit the whole crop in short or long pits, as much being near the byre as space and time will allow. The rest to be put in similar pits in the field, to be carted off only in frosty weather when the ploughs cannot work, and when the soil is so hard that it

PERMANENCE OF MANURE.

Experiments on this subject were suggested ten years ago by the passing of the “Agricultural Holdings Act,” which instituted the principle of compensation for unexhausted manures. At that time, however, no definite information appeared to exist as to the relative rate of action of different kinds of manure. A series of experiments was, therefore,

FIG. 75.—NUTTALLIA CERASIFORMIS: SPRING-FL. WEING. ROSACEOUS SHRUB, FLOWERS WHITE. (SEE P. 487.)

TURNIP CROP.

In the question of winter treatment of the Turnip crop, it was found that the risk entailed by complete exposure of the plants where they grow, is equal to the loss of the whole crop; also that the rough-and-ready way of furrowing or earthing-up, which only partially covers the bulbs, and leaves the heads more or less exposed, entails the risk also of nearly equal loss (83 per cent.). It seems clear, therefore, that this risk is far too great to be borne, and that some plan

cannot be injured. As to the effect on the Turnips—it was found that the storing caused a slight reduction on the percentage of moisture (0.77 per cent.) on an average, and hence gave a corresponding increase in the percentage of solid matter in the stored Turnips. Also that the usual excess of water in large roots was reduced, till the disparity between large and small roots disappeared, leaving a fairly uniform proportion of solids or food products in all the Turnips.

started with this object in view. The results have been carefully recorded yearly, and they clearly show the need for assurance of long continuity of experimental work before any settlement of arbitration can be based upon them.

SYSTEM OF SOWING GRAIN.

From various “Farm trials,” along with some smaller experiments, it may now be accepted that the crops to be got by the furrow system are at least

equal, and generally greater, than by the drill or broadcast systems. When it is recalled that little more than one-half of the seed is necessary, a feature of economy seems here presented, deserving, especially in these times of agricultural depression, of being taken advantage of.

#### SOILS AND PLANT GROWTH.

Not the least important of the investigations is an enquiry into the mechanical condition of soils as affecting plant-growth, in particular as regards Clover, the failure and difference in produce of which are shown to be clearly not due altogether to manurial poverty, but rather to the mechanical condition of the soil. It may be indicated tentatively that the practical outcome of the whole trial seems to be that among the plants usually cultivated on the farm, Clover demands in a special degree a soil, not necessarily firm and hard, as is generally supposed, but sufficiently cohesive, whether that cohesion is due to inorganic or to organic matter; and that when Clover growth is defective, such means should be taken as are fitted to secure this cohesive state. *J. J. Willis, Harpenden.*

### SCOTLAND.

#### FRUIT PROSPECTS IN SCOTLAND.

I HEAR that there is promise of an abundant crop of most kinds of hardy fruit. The unusually warm and dry summer of last year matured the growth of the trees, which came early to rest, and did not seem to be materially influenced by the wet autumn. Plums on walls are full of blossom; especially Jefferson's and Coe's Golden Drop on trees that were lifted. The useful Denyer's Victoria seldom fails, either on standards or on walls, although on heavy undrained land it is almost worthless, even when the crop is a heavy one. On wall trees the fruits are so fine that they scarcely seem to be of the same kind as those from orchard trees. Pears, as far as I have seen, are not so plentiful, except the hardier varieties. Apples are very promising, the shoots on nearly every tree being studded with blossom-buds. In most places where a proper selection of varieties was made, cultivators will this year, barring frosts, reap the reward of their pains.

All kinds of Cherries are as full of blossom-buds as I ever saw them; Morellos, especially, are clustered all over. On northern, eastern, and southern aspects, on low walls where the roots have been curtailed somewhat, and rich top dressings applied, the trees have formed natural fruit-spurs all over about an inch or two long. Small fruits will be very good, and bushes which have been lifted and require pruning never fail. The system of growing fruit-bushes that look like faggots is not to be recommended. It is premature to say what Strawberries in the north will be as a crop. While many varieties of late introduction have not become popular in the north, I learn that Royal Sovereign is likely to be retained as a useful variety, and I saw it lately at Keir being forced along with Keen's See-Hing, true, but it was not equal to the latter fine old variety. *M. Temple, Carron, N.B.*

### FOREIGN CORRESPONDENCE.

In the supplementary list of hybrid Orchids published in the *Gardeners' Chronicle*, on p. 431, allow one of your readers to correct an error concerning the origin of "Zygopetalum Perrenoudi," which is given with the name of M. Peeters as raiser.

This plant was raised from a cross between *Z. intermedium* and *Z. Gautieri* by the late M. Perrenoud, the well-known Parisian amateur, and exhibited at the meeting of the Société Nationale d'Horticulture de France on March 24, 1894, where it received an Award of Mérite of First-class.

I am the first one to recognise the well established reputation of the eminent orchidist, M. Peeters, but I think it right to call your attention to the error committed unconsciously to the prejudice of M. Perrenoud. *I. Cuype, Secrétaire de la Société Nationale d'Horticulture de France, Vésinet.*

## THE WEEK'S WORK.

### THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorset.*

DENDROBIUMS have formed a prominent feature in the Orchid-houses during the past few months, but the majority of the plants have now lost their flowers, and are developing new growths freely. Of such species and hybrids the following may be mentioned:—*D. Wardianum*, *D. crassinode*, *D. Findeyanum*, *D. priaulinum*, *D. albo-anguineum*, *D. crepidatum*, *D. Linawianum*, *D. superbum*, *D. cretaceum*, *D. nobile*, *D. Domini* X, *D. Ainsworthi* X, *D. splendissimum* X, *D. micans* X, *D. endocharis* X, *D. melanodiscus* X, and others. As the plants quickly emit new roots when the growths are only a few inches high, the roots should be supplied with fresh material at once, and thus prevent injury which would be likely to occur if the operation be delayed. Plants that are healthy and have sufficient root-room for further development, need only to be re-surfaced. If the young growths have not emitted any roots, the plants will presumably be comparatively dry, and in such condition the old soil is more easily removed. Carefully pick it out from between the roots as low even as the crocks, and, if necessary, additional drainage may be given. Plants which are unhealthy and have deteriorated from any cause, should be turned out of their pots, have all decayed roots cut away, and the remaining ones thoroughly cleansed. In re-potting such plants, use sphagnum-moss only, and put them in pots as small as possible. When re-potting well-established plants, do not disturb the roots unnecessarily, but break the old pot, and take away as much of it as is practicable without upsetting the drainage. Remove as much of the old compost as possible, and place the plant into a pot of convenient size, filling up with clean broken crocks to within half an inch of the rim. Over-potting is likely to prove sooner or later of detriment to the plants. Dendrobium roots very freely in an ordinary mixture of peat and sphagnum-moss, with a free addition of broken crocks. When fresh material is added, it should in all cases be pressed rather firmly around the plants. Strong-growing species, like *D. Dalhousieanum*, *D. calceolus*, *D. clavatum*, *D. fimbriatum*, *D. moschatum*, *D. dioxanthum*, *D. Paxtonii*, and the varieties of *D. nobile*, may be grown in pots, and after re-potting a plant, a sufficient number of the bulbs should be tied to neat stakes to make the plants firm. For young seedlings, dwarf-growing varieties, and those of pendulous habit, small shallow pans or baskets are preferable. The pans should have perforated sides, to admit of the circulation of air among the roots. Slender-growing varieties, as *D. micans* X, *D. rhodostoma* X, and its parents, *D. Huttonii* and *D. sanguinolentum*, *D. O'Brienianum*, *D. triadenium*, *D. purpureum*, &c., require a greater proportion of sphagnum moss, and less peat in the compost. *D. aggregatum* should be grown in shallow teak-baskets, with a very thin but firm layer of compost to root in; and *D. Jenkinsii* does thoroughly well if fastened on a block of dried Apple-wood, from which the bark has been removed, and suspended in a light sunny position. Any plants that are re-potted should be kept rather dry for a few weeks afterwards, and as the young growths emit roots, moisture, both at the root and in the atmosphere, may be gradually increased. When the roots have a firm hold around the sides of the pots, and the growths are making progress, syringe the foliage from the under side with tepid rain-water at closing time on warm sunny afternoons. All of the Dendrobiums mentioned should be grown in the warmest house, where they should be kept close to the roof-glass in full sunlight. *D. Bensonie*, *D. nodatum*, *D. Parishii*, *D. rhodopterigerum*, and *D. pulchellum*, must still be kept on the dry side until their flower-buds are well advanced.

PROPAGATION.—If desirable, all of the above-mentioned Dendrobiums may be increased in the following manner: Cut off some of the old bulbs, preferring those that have failed to bloom, and lay them down on some fresh living sphagnum-moss in a hot and moist propagating-frame. Young growths will soon appear upon the stems, and as soon as they commence to emit new roots take off these growths and pot them in moss only. Sometimes aerial growths are produced from the top of the old pseudo-bulbs, and these should be taken off when only a few inches high and potted, and given treatment identical with that advised for older examples.

THE COOL-HOUSE.—Plants of the brilliant, scarlet *Sephorites grandiflora* are now rooting from the growths that have just flowered. Afford a top-dressing of peat and sphagnum, or repeat those that may require space. Give them a light position, but out of the line of draughts from the top ventilators. Keep them well supplied with moisture at the root at all seasons. The curious *Habenaria Bonatea* (*Bonatea speciosa*), also the pretty little *Triphia orthoceras*, are now producing new growths, and will require to be repotted in a compost of finely-chopped peat, loam, and sphagnum-moss, in equal proportions. Water liberally during the period of active growth.

THE TEMPERATURES of each division at night may now be a few degrees higher. In the East Indian-house about 67°, allowing several degrees more during the day, or by sunheat 10° will be beneficial. The *Cattleya* and Mexican division should not fall below 60°, and the day temperature should be from 5° to 10° above these figures. Where there is a separate house for intermediate plants, the temperature both by night and day should be a few degrees below that of the *Cattleya*-house. The cool-house must be kept up to 50° by night, and a trifle higher if the weather be mild. Carefully ventilate the houses during the warm hours of the day.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Burton-on-Trent.*

WALL TREES.—The disbudbing of the Apricot, Peach, and Nectarine should be carried on gradually in all cases. Borders should be examined in order to ascertain the state of the soil as regards moisture, affording water without delay if found to be dry; any neglect of this matter while the fruit is setting, causing loss from dropping later on. Enough water should be applied to thoroughly moisten the soil for 1 yard in depth; and it is well to remember that most of the roots are several feet away from the wall, more or less, according to the width of the borders. If manure-water is obtainable, it may be used in a tepid well-diluted state; and in the case of old trees or exhausted soils, it will act more beneficially than water alone. Peach and Nectarine trees, as soon as the blooms are set, should be well syringed with water on five days early in the afternoon. Keep a sharp look-out for aphid, black and green; as if once these pests are allowed to infest the trees, it is difficult to eradicate them completely. For insecticides, see p. 427.

STRAWBERRY-BEDS.—If new beds are to be made with the Strawberry-plants which have and are being forced, the latter, when cleared of their fruits, should be placed in frames and hardened off, care being taken not to neglect to water them when dry. Examine them for red-spider, and if any of these are observed, well syringe the under-sides of the leaves, or dip the plants in a mixture of sulphur and water. A good way to make this mixture is to throw a handful of flowers-of-sulphur into four gallons of boiling water and allow it to settle; when the water is sufficiently cool it is fit for use. The foliage may remain in the water for a few seconds. If the ground to be planted was well manured and trenched, and the surface left in a rough state, it may be broken down, levelled, and the rougher stones raked off. In planting, a small quantity of potting-bench refuse-mould may be placed round the mass of roots, which should be slightly set free at the sides. The new plantation may be laid out in beds with alleys between, or in rows at equal distances apart, having an eye to convenience of netting the plants when in bearing. I prefer to plant the Strawberries in beds 4 feet in width, with three rows to a bed, i.e., 18 inches between the rows, the same distance being kept between the plants in the rows. The alleys may be 2 or more feet wide. With bows of iron or wood and pieces of netting 2 yards wide stretched over them, the birds are kept out, and the fruits readily gathered.

### THE FLOWER GARDEN.

By HEDLEY WARREN, *Gardener, Aston Clinton, Trin.*

PLANT PROPAGATION.—The raising of bedding plants will have been brought to a finish ere this, unless it be that of novelties desirable of increase. Rooted plants standing in pans or boxes in which they were struck, should be potted off, also seedlings that may have been pricked out into boxes. Such are *Verbenas*, *Ageratum*, *Petunias*, &c., which plant out in better condition if they are potted prior to being planted. Most of these plants will require to be stopped, so as to give bushiness. The entire stock of bedding plants should be arranged, each kind or variety being placed by itself, thus saving time and labour at

bedding-out time, besides affording the gardener a better idea of his stock of plants. When in batches, special attention can also be given to those which need it. Continue to prick off seedlings of Perilla, Petunia, Pyrethrum, Chilian Beet, and others, affording these slight warmth till they reach a fair size, then transfer them to cold frames prior to bedding-out.

**BEGONIAS.**—Tubers of bedding Begonias that may have been placed on the borders of fruit houses to start into growth, may be potted up, and if they are of fair size, and a larger stock of them is required, they may be cut up into sections, and have some powdered charcoal applied to the cut surfaces, and be potted like the rest. It is usual to arrange these plants in beds by themselves, and it is the most effective mode of planting them.

**DORONICUM PLANTAGINEUM**, and its varieties, now fast coming into bloom, give a peculiar beauty to the herbaceous perennial borders at the present time. As a cut flower it is one of the best, and is very lasting. The plant can be readily increased by division, and this should be done frequently, so as to secure strong healthy plants. Some gardeners grow *Doronicum* in flower-pots, and very useful they are in that way, and satisfactory also if grown cool.

**PRUNUS PISSARDI**, a useful and effective plant when in bloom, should be extensively planted. The young leaves are of a pleasing coppery tint, that contrasts well with the white flowers of the plant, and with others. It is said to bear forcing.

**CANTERBURY BELLS.**—To obtain strong plants for next season, the seed should be sown about this date in pots or pans filled with a light rich compost, and placed in a cold frame, transplanting them when large enough into boxes, &c., and planting them out in a rich border in the open in June. If planted at about 1½ foot apart, they may remain for flowering during the following season, otherwise they may go closer together in nursery lines. Canterbury Bells have a good effect when planted in groups of several plants, and the single and double varieties should not fail to be planted in every garden.

**HOLLYHOCKS.**—Seedlings of the present season should be gently grown on in cold frames till the middle of the month of May, and then be planted where they are to flower. It is always advisable to have plants which possess strength, rather than to set out small weak plants at an early date, the latter often doing unsatisfactorily. The soil for Hollyhocks should be rich, stirred to a depth of 2 feet, and the plants should receive a good soaking of water when put out.

**MISCELLANEOUS HINTS ON WORK.**—Continue to mow the lawns, trim edgings, roll and sweep gravel walks and drives when these are in proper condition, and if drying winds prevail, afford water to all the recently-transplanted trees and shrubs.

## THE KITCHEN GARDEN.

By C. HERAIN, *Gardener, Droptmare, Maidenhead.*

**SALSIFY AND SCORZONERA.**—Seeds of these useful winter vegetables should now be committed to the ground, drawing shallow drills for this purpose 15 inches apart. The land should have been prepared as for Parsnips. The so-called Sandwich Island Manmoth Salsify is an improvement on the common variety, as it attains to a much larger size, and it is equally good when cooked.

**SEEDS.**—Full sowings of Savoy, early and late Broccoli (to be followed by another in two or three weeks' time), Kales, Cabbage, Early London, Pearl, Eclipse, and Autumn Giant Cauliflowers, and Brussels Sprouts. In making a selection of curled Kales, preference should be given to those of medium-stem height, rather than choose those of great height or dwarfness, and Sutton's A1 may be taken as typical of a good variety for gardens. During the severe frosts of 1895 the very dwarf varieties in our gardens were nearly all killed, while those of middle height escaped with very few losses. Asparagus Kales should not be omitted, as it is a very hardy variety, coming into use rather late, after most of the others are over, and it has the merit of producing many gatherings of excellent tops, which are of nice flavour. Radishes and Lettuce should be sown often enough to ensure a regular supply; while Mustard and Cress seeds may now be sown in the open border and covered with hand-lights. On a warm border a few rows of Dwarf French Beans, such as No Plus Ultra, may be sown, but these will, probably, need some kind of protection against cold later on, and seed should not be sown in large quan-

ty. Where a frame can be spared, a batch may be sown in small pots, and brought on slowly for planting in the open border. If Beans are required at an early part of the season, Scarlet or other Runners may be similarly treated, otherwise it is preferable to wait till May, and sow in the open ground.

**GENERAL HINTS ON OPERATIONS.**—Young plants of Onions standing in boxes are now ready for planting, and, assuming that the ground was prepared similarly to that on which Onion-seeds have been sown, shallow drills should be drawn, and the plants put into them with a trowel, being careful not to plant too deeply. The advantages of planting in a drill is that water reaches the roots more readily than if the land is level; and the plants will require water in dry weather. Cauliflower plants growing in pots, or which have been pricked-out in a frame from the earliest sowing, should now be ready for planting out; and the ground should have been well dug and heavily manured. For Cauliflowers of the Snowball type, a distance of 20 inches from plant to plant will suffice. After planting, place branches thinly around them as a protection against wind and sunshine, and let these remain till the plants have got partly established, on cold nights inverting flower-pots over the plants. French Beans that were sown in small pots some time since may be planted in cold pits forthwith. The soil for French Beans should be moderately light and rich, and be made firm before planting. When planting, afford tepid water to settle and moisten the soil. Syringe the plants on fine days, close the lights early, and cover the frames with mats at night. Early-sown Turnips will require thinning, the plants being left at about 4 inches apart, cutting out each alternate plant with the hoe if so many roots are not required. Later sowings, and those just coming through the soil, should have a small quantity of soot scattered over the land, if the birds attack them. The land on which the Onion crop is now visible in the rows should be hoed in dry weather; and a timely use of the Dutch-heel amongst other crops will be of much use in keeping down weeds, and promoting quick growth in seedling and other vegetables.

## PLANTS UNDER GLASS.

By Jno. McINTYRE, *Gardener, Woodside, Darlington.*

**BOUVARDIAS.**—In few private places are these well grown, but no plants give better returns than do these if well grown. They do best when young, and being easy to propagate, there is no difficulty in keeping up a stock of young plants. Plants that having completed their bloom, were cut hard back, and placed in gentle warmth as soon as this was done, will have commenced to break by this time. Reduce the balls so as to get them into a lesser sized pot, place them in a warm pit, or in a hot-bed, and keep close for a few days. The soil for potting should consist of two parts leaf-mould, and one part loam and silver-sand. As soon as the plants are established, pinch off the points of the shoots, so as to induce bushiness. If partly-spent hot-beds are available, place a layer of soil of a light nature to a depth of 3 inches on the surface, and plant out the stock of Bouvardia plants therein, allowing 1 square foot to each; keep the frames close for a time, and syringe the plants overhead night and morning. Now is a suitable time for taking cuttings of Bouvardias. Some gardeners prefer root cuttings, and good plants are obtained in that way, but bloom seems to me to be more abundant on plants raised from cuttings of shoots. Having got ready some thumb pots, fill them with a very light kind of soil, mixed with silver-sand, insert one cutting in each, plunge the pots in bottom-heat of 75°, and when well rooted remove to a shelf near the glass, and as soon as the plants have filled the pots with roots, plant them in frames in the manner indicated for the old plants, but allowing about half the space afforded these. The shoots should be repeatedly stopped.

**FICUS ELASTICA.**—This useful decorative plant being a rapid grower, and soon getting out of bounds, should be propagated annually. As soon as a plant has attained a height of 2½ to 3 feet, the tops may be taken off 9 inches in length, and placed in a 3-inch pot, which should be plunged in a brisk bottom heat and shaded, when it will soon form roots; removing it, when this has taken place, to a shaded part of the stove. In a few months, it will have made a nice useful plant. The variegated variety is as vigorous a grower as the type, and by some persons it is considered more ornamental. In potting, clean well-drained pots and good turfy loam mixed with mortar

rubbish and wood-ashes, should be used. If a sufficient stock of plants is not obtainable by taking the tops, every mature leaf, if taken with an inch or so of the shoot or stem, can be turned to account, but a longer time is necessary to make a plant.

**ASPARAGUS PLUMOSUS.**—If the plants in stock have become unduly large, it is still time to improve their appearance, as well as increase the number of plants by division. In repotting after dividing, as well as when planting out in borders, &c., use turfy loam, peat, and charcoal in a coarse state, and make the soil quite firm about the roots. The plant requires a rather long rest after growth is complete, and to be freely and frequently afforded liquid-manure when in growth.

**ARALIAS.**—The finer species and varieties, viz., *A. Veitchii*, *A. V. gracillima*, and *A. elegantissima*, are almost indispensable table plants, and to have these plants in good condition they should be firmly potted in clean, not over large pots, in peat, leaf soil, and silver-sand. *A. Veitchii* and *A. V. gracillima* may be struck from cuttings, but it is a slow process, and it is better to graft on *A. Charbrieri* or *A. reticulata*, putting on the scion by means of cleft-grafting close to the level of the soil, so that the plants may be furnished with foliage down to the pot. In performing this operation, grafting-wax should be used, and the plants kept in a close warm case till a union is effected. Those who have not the right kind of stocks must purchase a few plants annually. When a plant has become of decorative size, less heat should be afforded, which will have the effect of preventing a too rapid growth.

## FRUITS UNDER GLASS.

By W. POPE, *Gardener, Highlers Castle, Newbury.*

**STRAWBERRIES IN POTS.**—With the cold winds and hot sun generally prevalent at this season, care should be exercised in ventilating the house, so as to avoid currents of cold air coming in contact with flowers and fruit, as a check is afforded that is often fatal in its consequence. Shelves, &c., should therefore be placed well below or above the level of the inlets. In dull or wet weather it is advisable to distribute the pollen as the blossoms open with a soft brush or a plume of Pampas-grass. Thinning the fruit should be seen to as soon as a sufficient number is set and freely swelling, a dozen on a plant being a sufficient number for a crop, and half that number will secure the finest results. Water should be afforded in sufficient quantity and as often as may be required, which may be twice and sometimes thrice a day, always giving tepid weak manure-water; but when the fruit begins to colour, affording only clear water. Syringe regularly at closing time whilst the fruit is swelling to keep red-spider in check. Night temperature 65°, and 75° to 85° in the daytime with sun, closing at the latter figure.

**VINES: EARLY HOUSE.**—Where hard forcing is practised, red-spider is apt to put in an appearance, rendering necessary the sponging of the infested leaves with soap-suds, and the painting of the hot-water pipes with lime-wash and sulphur. If thrips appear on the foliage, which is probable if there are pot-plants in theinery, the best remedy is fumigation, which should be done for two nights in succession, and repeated after the interval of a week. For ordinary tobacco-paper Luff's Fumigator is the best I have used, the smoke being given out in a very cool state, and it is very effective in its operation. Grapes which are quite ripe should now be kept cooler and drier, but a moderate amount of moisture is still necessary to preserve the foliage in health, which, with freer ventilation, will not be detrimental to the ripe fruit.

**SUCCESSION-HOUSES.**—Attend to thinning the bunches and berries. Stop or remove laterals, especially where there is no room for their extension. Ascertain the state of the border as regards moisture, and afford water when it is found that the soil is dryish, old and weakly Vines being afforded tepid liquid-manure, or an occasional top-dressing of an artificial manure, which should be watered in. Guano-water may be frequently sprinkled about the house, and placed in the evaporating troughs.

**EARLY MELONS.**—Fruits growing fast, should be fixed on their supports in good time. A sufficient number of fruits being set, all flowers and superfluous growths should be removed, and warm liquid-manure afforded at the roots, securing plenty of aerial moisture by damping down twice a day, and syringing lightly when shutting up the house on bright afternoons. When ripening commences lessen the supply of water, affording sufficient to keep the foliage healthy, and leaving a small amount of air constantly on at the top of the house.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, APRIL 21 { Royal Horticultural Society's Committees, and National Auricula and Primula Show, at the Drill Hall, Westminster.

WEDNESDAY, APRIL 22 { Ancient Society of York Florists, Members' Show.

## SALES.

TUESDAY, APRIL 21 { Imported Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY, APRIL 22 { Carnations, Lilioms Begonias, Greenhouse Plants and Ferns, &c., at Protheroe & Morris' Rooms.

THURSDAY, APRIL 23 { Clearance Sale of Stove and Greenhouse Plants, Garden Implements, &c., at Ickworth Park, Rury St. Edmunds, by order of A. H. Wood, Esq., by Protheroe & Morris.

FRIDAY, APRIL 24 { Orchids from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—49°2'.

The "Royal Botanic" and its Conferences. WE may appropriately offer our congratulations to both of the metropolitan horticultural societies. It is refreshing to see the Royal Botanic at length realising more fully that it has other duties to Horticulture and Botany than those pertaining to fashion and frivolity. It is gratifying to Fellows of the Royal Horticultural Society, more especially to those who have taken an active part in its working, to find that the value and importance of the "Conferences" have been so far recognised outside the limits of the Royal Horticultural Society as to have received the very sincere compliment of the closest imitation. The Royal Botanic has this week held a Daffodil Conference, precisely on the same lines as the Conferences that have been so successful at Chiswick. We use the word successful without any direct reference to financial considerations. We fear, from the Treasurer's point of view, success did not result from those gatherings. If, however, we look to the mass of well-sifted and valuable information got together, say, at the Orchid Conferences, the Primrose Conference, the Conifer Conference, and the various similar meetings devoted to flower and fruit culture, then the dullest must admit the great advantages those gatherings have proved to horticulture generally. The Royal Horticultural Society has largely enhanced its reputation at home and abroad, and has taken a much higher position in the minds of competent judges than it once did. Previously it was looked on by some in the light of a mere source of amusement, by

others as a floral bazaar where those who have to sell display their wares before potential purchasers. We are far from deprecating these as functions of a great society, but these are not the only work of such societies, and we plead most earnestly for the simultaneous effort to realise higher ideals, to increase the stock of knowledge, to turn what we have already to better account; in a word, to promote the progress of horticulture. The great societies were established for this purpose alone, and in proportion as they have been true to their trust have they been successful. Whenever they have allowed the true interests of horticulture to be subordinate to other matters, then invariably have they fallen upon evil days. This circumstance has led us to observe with pain and apprehension that in the programme of the Royal Horticultural Society for the year no meetings of the kind we are considering, are announced to be held at Chiswick. On the other hand it is satisfactory to see the Royal Botanic breaking away from the stereotyped monotony of its proceedings by holding conferences on Daffodils and other subjects.

The list of papers arranged to be delivered at the Conference "at the Park" was an ample one, and it is not surprising that a few of the papers were taken as read, especially as the Conference was confined to the opening day of the exhibition. Held in the lecture-room of the Museum, more agreeable surroundings could hardly be wished, and had the weather been propitious, very probably the audience would have been a larger one. The walls of the room were almost hidden by numerous drawings and paintings of Daffodils, either representative of the different types of the flower, or of the botanical differences in the species. The Conference was honoured by the presence in the chair of Mr. J. G. BAKER, F.R.S., of Kew, and the opening address was delivered by Mr. F. W. BURBIDGE, M.A., F.L.S., Curator of Trinity College Gardens, Dublin. Previous to this being delivered, the chairman informed the Conference that he had the pleasant duty of presenting to Mr. BURBIDGE a Silver Cup, which had been given by Messrs. BARR & SON, in appreciation of the successful efforts made by Mr. BURBIDGE to popularise the flower they had met to discuss.

The further proceedings at the Daffodil Conference are alluded to more fully in another column.

Announcement is also made of a conference and show of Violas, "tufted," show and fancy Pansies, under the auspices of the National Viola Society, on a date to be fixed later on. A similar conference and show of English "Amateur Tulips," whatever they may be, will also be held on some date to be fixed hereafter.

ROYAL HORTICULTURAL SOCIETY.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, April 21, in the Drill Hall, James Street, Victoria Street, Westminster, 1 to 5 P.M. A paper on "Pineapples," by Mr. H. W. WARD, will be read at three o'clock. A point of special interest at this meeting will be an exhibit of several kinds of fruits and vegetables preserved in Messrs. DE LUCCA, HILL, & Co's patent self-closing bottles, which recently received an award of a Banksian Medal from the Fruit and Vegetable Committee. The fruits, &c., to be exhibited were bottled last summer, and they are in perfect condition. The system is so easy, simple, and economical, as to commend itself to all housekeepers and fruit-growers who wish to preserve fruit and vegetables for winter use.

MR. W. T. THISELTON DYER.—The University of Glasgow has conferred the honorary degree of LL.D. on the Director of the Royal Gardens, Kew. It cannot be said that the Universities have been premature in the conferment of honour in this case.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Wolverhampton and Staffordshire Auxiliary of this Institution held a successful meeting at Lichfield last Tuesday, under the presidency of the Mayor (G. ASHMALL, Esq.). Mr. G. A. BISHOP (Chairman) spoke at some length upon the advantages and benefits of the Institution. Mr. G. AMBROSE, Semerford Hall Gardens, also gave an appropriate address. The committee were pleased with the result of the meeting. Several influential gentlemen accepted the position of stewards, and promised to thoroughly canvass Lichfield for donations and subscriptions to the Institution.

A TRIAL OF VIOLAS AT THE ROYAL BOTANIC SOCIETY'S GARDENS.—The Council of the Royal Botanic Society has given permission for an extensive trial of Violas to be carried out this summer under the supervision of the Viola Conference, of which Mr. A. J. ROWBERRY is Chairman, and Mr. RICHARD DEAN Secretary. The raisers and cultivators of new varieties have been appealed to, to send in plants of those sent out during the past five years, and particularly the new varieties of 1895-96. Some 3000 plants have been planted in the Rhododendron-garden, including a representative collection of the best of the older varieties for comparison. Contributions have been received from many parts of the country, and there is every probability that the trial will be as satisfactory as it is extensive. The varieties will be examined during the summer months by a representative committee of experts, who will report to a Conference meeting in the month of August. The re-organised National Viola Society will hold an exhibition in the Botanic Gardens, and a schedule will shortly be issued.

HORTICULTURAL CLUB.—The monthly dinner and *conversazione* took place on Tuesday evening last, but owing to the Easter holiday the attendance was not so numerous as usual. An interesting paper was read by Mr. F. W. BURBIDGE, Curator of the Trinity College Botanic Gardens, Dublin, on "Evolution;" the discussion afterwards upon it was joined in by all present, and a vote of thanks was given to Mr. BURBIDGE for his paper.

EALING GARDENERS' ASSOCIATION.—A numerous gathering attended the Annual Dinner and Prize Distribution of this flourishing body, held at The Feathers Hotel, Ealing, on Tuesday evening last. R. WILEY, Esq., the President of the Association, occupied the chair. From the statement of the Hon. Secretary, Mr. W. ROBERTS, in reviewing the useful work of the session just closed, it appears that twenty-five meetings were held, and sixteen new honorary members, and a like number of ordinary members, were elected. The Secretary threw out a good suggestion as to establishing a "Gardeners' Registry" in connection with associations of this description throughout the country, to which those in want of gardeners in their respective districts might apply, and be supplied therefrom with competent men.

ORCHID BLOOMS AT A PENNY A PIECE.—"Only a penny! An Orchid for yer buttonhole for a penny!" Such was the ejaculation that grated on my ears in Cheapside on Wednesday, says a writer in the *Licensed Victuallers' Gazette*. Itinerary vendors frequently play "spoof," and I at once concluded that the pretty girl who was selling Orchids at a penny-a-piece was at the good old game. But I was mistaken, for I purchased a bloom of *Odontoglossum vexillarium* for the twelfth part of a shilling!

PRIMULA SIEBOLDI.—A large number of plants of the type has been planted out in Regent's Park, and as they are growing freely, and promise to flower well, a very attractive and novel feature will be

A WATER-SIDE VIEW IN THE GARDEN OF THE HON. MRS. GILBERT, TRELISSICK, TRURO.

provided. Mr. JORDAN is to be commended for his spring arrangements, the beds of Tulips in particular are superb; the leading varieties, Proserpine, silken-rose; Keizer's Kroon, crimson, bordered with yellow, a magnificent bed; Joost Van Vondel, rosy-crimson, somewhat late, and others. The beds of single Daffodils are very fine; Emperor, Horsfield, and Sir Watkin are flowering very finely.

**STOCK-TAKING: MARCH.**—The holidays have interfered with the publication of the Trade and Navigation Returns for March. Trade continues to improve, and the imports for the month reached the sum of £38,314,750—an increase on those for the month of March, 1895, of £2,384,860. Our usual extract from the "Summary Table" of the month's business is as follows:—

IMPORTS.	1895.	1896.	Difference.
Total value of imports	£ 35,959,890	£ 38,314,750	+2,384,860
(A) Articles of food and drink—duty free ... ..	10,691,199	12,132,204	+1,441,005
(B) Articles of food and drink—dutiable	2,450,617	2,188,624	-261,993
Raw materials for textile manufactures ... ..	8,049,763	7,094,103	-955,660
Raw materials for sundry industries and manufactures	3,131,237	3,330,295	+199,058
(A.) Miscellaneous articles ... ..	1,251,395	1,226,724	-24,581
(B) Parcel Post ..	81,853	90,718	+8,865

The principal increase was in articles of food and manufactures. Indian corn increased in value by £306,000, and wheat, meal and flour by £260,000—principally imports from Russia, which country also sent a large quantity of oats. Butter showed a rise of £270,000, chiefly in the production of Denmark. The sum of £627,000 of increased value is placed to the sugar account—the refined article being chiefly from Germany; whilst France was first in the un-refined. Except in Tobacco, dutiable articles show a reduction—Tea being lower by £44,000; Coffee, by £78,000; and wine, by £107,000. By the way, the increased value of Tobacco was £121,000.

The increase on manufactured articles foots up no less than £1,369,000—silk, from France (principally), standing at £431,000; leather goods from India and the United States increased by £242,000. Textile materials are less than in March of last year—the decrease in the value of wool from Australia being very great; Jute fell £329,000; whilst raw Cotton went up by £549,000; and Flax and Hemp increased in value; imports of timber gained some £70,000. Here we place our usual figures representing business done in foreign fruits, roots, and vegetables.

IMPORTS.	1895.	1896.	Difference.
Fruits, raw:—			
Apples ... .. bush	219,373	179,938	-48,435
Cherries ... .. "	—	—	—
Plums ... .. "	14	17	+3
Pears ... .. "	4,247	124	-4,123
Grapes ... .. "	2,131	2,430	+299
Unenumerated ... ..	29,679	52,265	+22,586
Onions ... .. "	425,696	283,705	-141,961
Potatoes ... .. cwt.	322,261	31,559	-290,702
Vegetables, raw, unenumerated ... .. value	£74,574	£115,141	+£40,567

By the way, there may be some connection between the falling off in wine imports and the decreased product in France during the last season, when, though 600,000,000 gallons of Burgundy and claret were registered as the result of the Vine harvest, that was less than the outcome of 1894 by 272,000,000 gallons! Possibly also the outlook for 1896 may not be more promising. In the matter of

**EXPORTS.**

there is a good account to render. The returns for March show a total of £20,422,419—an increase of £1,839,389. The three months give us £61,233,643,

or an increase of £3,512,682 over the same period last year. This is a fine exhibition of industry, and textiles contribute of this amount a sum of £837,000. Cotton piece goods increased by about £534,753, Indian buyers taking more than previously. What reduction there was in woollen goods taken by America was made up for by increased purchases for the Continent. To the increase of £455,000 in metals, railway iron, &c., Australia and India contributed largely; but in tinplate to the United States there was a fall of one-half. South Africa took largely of machinery; and of cycles, it is worthy of note, that our exports to all countries keep on rising—the gain for March being £34,000. Altogether the increase in exports is rather over 16 per cent. as compared with the same period last year. And the revenue for the year exceeds that for its predecessor by more than £7,000,000!

**"LONDON TRIFLES."**—"I am going to ask you to call attention to a little matter—a trifle, in fact, which I think ought to be publicly noticed. You know how particular horses are in having their fodder clean and sweet, and that the hay-dealer never uses his hay-cart for carrying any manure, or for any dirty work. Why should not human beings have the same attention paid to them? But you find that the carts and waggons, which come in the early morning to Covent Garden Market laden with vegetables, return about mid-day full of reeking stable-manure. You can see this any day and every day on the Uxbridge Road; and, as the late agent of the Duke of Bedford stated in evidence before a Parliamentary Committee, it has been the practice to use the vegetable waggons in this double capacity time out of mind. Is it not about time this bad habit ceased?" *John Lloyd, in Times.* [This is assuredly not a trifling matter. It is one against which the horticultural press has protested time out of mind, but without avail. ED.]

**POTATO DISEASE AND STRAWSONITE.**—In answer to Mr. McDERMOTT (Kilkenny, N.), Mr. GERALD BALFOUR (Leeds, Central) said:—"The results of the experiments conducted in 1895 by the Agricultural Department of the Land Commission for the purposes of testing the value of Strawsonite and other solutions as preventives of the spread of Potato disease in Ireland are fully detailed in the report recently presented to Parliament. These experiments, on the whole, were most successful and satisfactory in their results, and indicate that a timely application of the solutions is beneficial, not alone in prolonging the period of growth of the plant, but in lessening the ill effects of the disease, and increasing the relative yield of Potatos. I may remark that the experiments, which were originated in the year 1891 at the request of the Irish Government, have since been carried out from year to year, and the results attained, with other information, have been embodied in leaflets, and very extensively circulated throughout Ireland amongst the farming classes and other interested persons. I now propose to ask the Land Commissioners to issue the recent report to Poor Law Boards, agricultural societies, and other bodies interested in the matter, as well as to the Press, and also to continue the circulation of the leaflets. *The Times, March 31.*

**VEGETATION IN THE SOUTH OF IRELAND.**—A correspondent of the *Bristol Times and Mirror*, writing under date of April 4, from county Cork, remarks:—"The roads and fields in the south of Ireland just now present a scene of surpassing loveliness. It is a particularly early season, even in the south of Ireland, and the golden Gorse and the white blossom of the Blackthorn are exquisitely enchanting. Go wherever you may just now, the golden bouquets of the Gorse will meet your eye in all directions.

**PLANT PORTRAITS.**

**BACCARIS TRIMERA.**—A very curious and interesting species, with spreading, deeply-three-winged branches. *Revue Horticole, April 1.*  
**CATASBFUM SPECIES.**—A series of very interesting forms introduced by the collectors of the Horticulture Internationale. *Lindonia, tt. 503, 504.*

**NEW INVENTION.**

**STEAM-HEATING OF GLASSHOUSES.**

THE heating of glasshouses in gardens by means of steam is not a novelty in principle, and the only departure that we observe in the system of Messrs. Babcock & Wilcox, Ltd., lately brought under our notice, is that the steam generated in a central boiler is conveyed by means of underground pipes to the houses to be heated. Instead of being used directly to heat the houses, the steam is conveyed into hot-water heaters, which furnish the hot-water with which the structures are heated. The steam is applied to the water in these heaters by means of a coil of pipe, and becoming condensed in its passage through this coil, it is conveyed as warmed water back to the central steam-boiler. If a group of houses has to be heated, two water-heaters may be used, with the pipes so arranged that one or both may be used at the same time. One great advantage of this method of heating is, that the existing system of piping in glass houses may be used, nothing being done away with. The saving of fuel is very great, it being a well-known fact that a great deal of heat is lost in the ordinary boiler-furnace, and the combustion is imperfectly carried out; moreover, there is a saving in manual labour.

Another advantage is claimed in the tall boiler-house chimney, which carries the products of combustion high up into the air, not diffusing unpleasant odours and "blacks" to render glass opaque and besmireh everything around, like the low chimneys usually afforded the ordinary hot-water boiler.

The system has been carried out with success at Alnwick Castle, where not alone the glass-houses are heated by it, but the laundry and apartments in the Castle; and also at the residence and in the gardens of H. S. Leon, Esq., Bletchley Park, where the steam is also used to drive an electric-lighting engine, and for pumping purposes.

As bearing on this application of steam to heating purposes, we publish the following communication from Mr. G. Harris, of Alnwick Castle Gardens:

"Respecting the working and general efficiency and adaptation of the use of steam to the heating of water in existing hot-water-pipes in horticultural buildings, I may say that the system has been in operation at Alnwick Castle for many years, and so far as I know it was first applied here on a large scale to heating glasshouses and other purposes. Some few difficulties cropped up, and one was to estimate the amount of steam required to heat a certain quantity of piping, and for the many purposes for which it is used at the Castle, which are difficult to estimate. Again, it was necessary to ascertain the proportion of steam coil pipe to the pipes to be heated, and the form of passage through the valves in the steam pipes. These difficulties, however, were surmounted, and I can truthfully say that at the present time the system is working far more regularly than any apparatus heated by tubular or saddle-boiler, where the water is heated direct by the fire. We have night and day stokers, and steam is constantly kept up. The furnaces are fed by self-feeding hoppers, which renders the use of small coals a necessity, the hoppers being driven by a small engine. I am not able to say anything as to the economy or otherwise of this system of heating, but I know that the steam plant is very costly, and would only be suited to places where it can be used extensively in a variety of ways. It is of great advantage in gardens situated near to the mansion, so that it may be put to a variety of purposes. Here it is used for boiling and cooking in the kitchen; for boiling and drying clothes in the laundry; for heating the Castle by several methods, viz, steam pipe, hot-air and hot-water. It was originally estimated that the equal of 25,000 feet of 4-inch pipe was heated, but there have been frequent additions, so that that estimate is too low. The main steam pipe is about 600 yards in length; the boilers are placed near the middle of this pipe, and owing to the great length the steam has to travel there was some considerable loss of heat by condensa-

tion, but this loss is reduced largely by the pipes being encased in non-conducting material. With this system there should always be duplicate boilers, so that if one is under repair, which is somewhat frequent, there is no break in the heating. The system is attached to the hot-water pipes in each of the old stove holes, and the old boilers are retained in working order. Through the regularity of the heat afforded by steam, vegetation grows somewhat faster. Some essential particulars are, to have the steam under perfect control by means of taps that are furnished with a graduated slot; and a steam-gauge fixed to the main steam pipe that leads to the glasshouses, so that whatever the pressure of steam in the boiler, it can be controlled at the glasshouse. With these appliances and safeguards it is a splendid system of heating, very convenient in winter for the gardener to turn on heat during severe weather late at night, with the certainty of finding all the houses of a proper degree of warmth in the morning. This is a great comfort, and one can really sleep when there is a trustworthy stoker in attendance. I have an electric tell-tale bell in my bed-room, so that if steam should run down during the night, which very rarely happens, the occurrence is indicated. The smoke from the boiler furnace is largely consumed where the apparatus is equal to the work, and has not to be hard driven. *George Harris.*

Steam used in this manner has none of the disadvantages and evils of direct heating by steam, the air not being rendered inimical to plants by coming in contact with highly-heated pipes; the heat is regular, not intermittent, and there is no danger of pipes bursting within the houses, and no necessity for altering the plant where such exists.

#### A NEW INSECTICIDE.

We have received from Messrs. Lawton & Co., 3, Savage Gardens, London, a sample of a new insecticide known by the name of "Bala," and recommended by them for the cleansing of plants of any description. After testing the preparation on a variety of subjects, it has been observed that "Bala" kills aphids instantly. It leaves no deposit on the foliage, nor does it injure the young and tender growths upon plants. In the case of red-spider or thrip, this insecticide does not appear to be so satisfactory.

## HOME CORRESPONDENCE.

**AMERICAN SPECIES OF LARCH.**—Referring to Mr. Webster's letter respecting Larch trees, the trees which have been grown at Boynton for eighty or ninety years under the name of Red and Black Larch, are the two trees described in London as two varieties of *Larix americana*. I had planted here a few years ago two or three plants of *Larix occidentalis*, but they have not thriven, and are all, I think, dead. The Red and Black Larches are very different from one another in all respects. The Red Larch is more like the European Larch, and in loose, rather wet, sandy soil, grows at Boynton as fast, and to as large a size; but we do not consider the wood to be quite as good as that of the common Larch. The Black Larch is a slower grower; even those grown in swampy ground can hardly be described as "of large size," although perfectly thriving and healthy. Although I have not been able to try it, I suspect that the wood is harder, heavier, and more durable than that of either of the others. *C. W. Strickland.*

**VEGETABLES AND VEGETARIANS.**—The note on p. 458 does not deal with what is, unfortunately, the real difficulty; i.e. that cooks and housewives, who know how to cook vegetables properly are the rarest curiosities. We always have three or four vegetables to dinner, and without being vegetarians, I depend more upon these for my dinner than on anything else. When away from home, either in private houses or in the best hotels, I make a rule of avoiding vegetables, with the rarest exceptions, for the simple reason that they are almost invariably badly cooked and unpalatable. In our thirty-five years of experience in house-keeping we have never yet met with a really good vegetable cook who has not required a long training; some appear to be quite incapable of learning how not to spoil a large proportion. The full demand for vegetables which is possible will never

exist until the way to cook them is better understood. Like some other things, "they do these better in France;" and in the foreign restaurants in that country one is pretty sure that the vegetables are, as a rule, good, and properly cooked. *T. F.*

**THE CROWDING OF HERBACEOUS FLOWERS AT SHOWS.**—This matter does not receive the attention it deserves at the hands of some show committees, and the present seems a suitable moment to point to what should be avoided, and how the various exhibits can be best presented to the visitors. At the last year's show at the Temple Gardens, there was much left to be desired, both in arranging the exhibits, and regulating the traffic through the tents. A good system prevails in some provincial centres in which herbaceous plants are well grown. Instead of one great gathering of cut flowers of herbaceous perennials, they are cut up into three or four classes, beginning with competitions of six, and ending with forty-eight, thus enabling the various competitors in the different classes of six, twelve, twenty-four, thirty-six, and forty-eight to contend on something like equal terms. Of course, if thought desirable, there might be at such shows as those of the Temple, the Crystal Palace, York, Manchester, and Edinburgh, open trade classes for an unlimited number, but for general purposes and for small growers, forty-eight would be about as many as could be shown in perfection. There might likewise be a limit put to the number of spikes to be shown, or of the bunches, as the case might be. This would enable the onlookers to judge of the beauty of the individual flowers or spikes, and would not handicap the small growers. The correct and careful naming of everything shown is very desirable on account of the educational value to the public generally, and the convenience of judges and reporters. *D. T. F.*

**THE HYACINTH AS A TOWN PLANT.**—If any one desires an illustration showing the fitness of the hyacinth for towns, he will get it by inspecting the beds of Hyacinths in Parliament Square, Westminster. The regularity with which the bulbs have grown and bloomed, and the effective symmetry of the beds, with their bold and striking masses of colour, attract the attention of passers by. As a rosy-pink variety for massing, *Gertrude S. R.* appears to be perfect, and is more desirable than a variety of a deeper tint; this variety throws a medium-sized and very symmetrical spike. As a blue, *Charles Dickens* is perfect, it is both bright and effective. *Lord Byron*, as a delicately tinted silvery grey-blue, is scarcely effective, it is too creamy; a delicate pink, like *Norma*, would perhaps be better, or a deeper tint of sky-blue, like *Leonidas*. *Sir Henry Barkly* is of a dull hue of claret, and is too dark to be effective in the open. *Alba maxima*, as a white, is very good. Clear bright tints of bright rose or lively pink, blues of intermediate tint, neither too dark nor too light, pure whites, or a good bluish-white, all tell against the setting of green grass about the beds, and that should be borne in mind. Still, it is a charming garden of Hyacinths, and does the planter and caretaker great credit. *R. D.*

**THE LARCH DISEASE.**—In continuation of the subject of my remarks, see p. 435, I will record my observations of the manner in which the disease originates and develops in the tree. I have seen it distinctly in the plants in the seed-bed two years old, but could never detect it in the one-year seedlings; and from this I infer that the disease originates early in the season—probably in April and May, and before seedlings are above ground, whereby they escape for the first season, but are less or more exposed to it ever afterwards. But what is the producing cause of this disease? Is it frost, unsuitability of the soil, unfavourable situation, unselected seed, seed from unsound trees, or what? This is the question of questions, and I shall endeavour to answer it as best I can, and leave it to the intelligent forester to say how far I have succeeded or failed. I do not believe it is frost that produces the blister in question, although frost may be capable of so doing; neither is it the soil, for although unfavourable soils produce other forms of disease, both in the Larch and other trees, yet there is no reliable evidence that it produces blister. Nor is it the locality or situation that produces it, for although it is one of the influences at work in producing the blister, yet of itself it does not do so. Nor again is it from the seed that the blister is caused; nor does it matter whether the trees are of foreign or home-growth, seeing that we have diseased and sound ones alike from both. Although none of these is the direct cause of blister, it is not to be inferred that none of them has a distant and remote influence in producing it. Having indicated several suspected

causes of blister, but such as will not stand careful scrutiny, we turn next to another cause which above all others is chargeable with the complaint, viz., the tender and sensitive bark of the tree. I have not arrived at this conclusion in a day, a week, or a year, but through the careful observation and study of many years. It is not enough to make an assertion, however strong, upon anything, but rather to marshal facts together and go to work, taking evidence as from witnesses in a court of law. If it were to take me as long time in describing the process gone through in finding out the cause of Larch blister, as in finding it out, many who might hear the Alpha would never hear the Omega. It is, however, patent to everyone that all trees, whether fruit or forest trees, that have a smooth, thin, and tender bark, are more liable to disease than those with a thick, rough, corky bark. Some trees have a thick corky or leathery bark from their very earliest stages of growth, such as the Oak, Elm, Spanish Chestnut, Birch, Geau, &c., and these are singularly exempt from bark disease; indeed, except from accidental injury to the bark, they seldom or never contract bark diseases. On the other hand, smooth, thin, and tender-barked ones, as the Ash, Beech, Larch, and others, suffer severely in blister and other diseases of the bark. It is necessary, however, to draw a line of distinction between trees that are tender in the bark at one stage of growth, and which become more proof against infection at another stage. Some are only tender at an early stage, and quite hardly later on in life; while others remain tender from the seedling upwards. The Beech belongs to this class, as is seen in the thin sensitive bark of a tree 100 years old, which never becomes thick or corky. Another class, again, to which the Larch and Scots Fir belong, is alike tender and sensitive in the bark till of a certain age. In the Larch, with which we are now dealing, the stem assumes the hard scaly and corky covering when about twelve years old. That is to say, the tree that has grown twelve years, takes on the corky covering on the lower part of the stem at that age; next year another year's growth is covered with the corky bark, and so on year by year. By these means it might be thought the whole stem of the tree would be covered with the corky bark, when the tree would be safe and beyond all further risk of injury from blister. This, however, is not the case, since the tree, which is being covered with corky bark at the bottom, is making new top growths, and these too require covering as much and in the same manner as the lower part of the stem referred to. Not only is the stem exposing new tender bark by every year's growth at the top, but it is liable to blister the same or nearly the same as at the bottom or lower part of the stem; and every branch of the tree, and every twig of the branch, is undergoing the same process as in the main stem, that is to say, the first formed and oldest part of the branch assumes the corky bark part first, and year by year so much additional, but at the same time the branches and twigs are adding to their length at about the same ratio as the other end is taking on the corky bark. In this way the tree, as long as it is growing and adding to its height of stem and length of branches, is keeping the tree in the same critical state as to blister as it was when only twelve years old, when it assumed the first coating of corky bark at the base of the stem and lower branches. I purpose to treat of the origin and development of the disease, and wherein it differs from other bark diseases of the same class, such as exists in the Beech, Ash, and Scots Fir, &c., on a future occasion. *C. Y. Michie, Cullin House, Banffshire.*

—Mr. Michie was quite right in saying that the Larch disease affects young trees, but whether so young as the seedling stage I am not prepared to say. Many thousands of plants ranging from three to five years old were killed outright in Wales, and to make sure that this was caused by the Peziza, I forwarded part of the sample that had been sent to me by the owner for identification to Professor Marshall Ward, who corroborated my statement that it was the Larch disease. Mr. Elwes, of Colesbourne Park, pointed out to me many in a plantation of three years' growth that were affected. *A. D. Webster, Boarwood.*

**MAGNOLIA CONSPICUA.**—I was pleased to see the notice in your issue of the 11th inst., of this splendid spring-flowering shrub at Gunnersbury House, Acton. It is not often that it is seen to perfection in the north of England; but on the south aspect of Mr. T. G. Horsfall's residence, Hornby Grange, Northallerton, I saw a

plant recently upwards of 30 feet high, reaching to the eaves, and trained across above the window and door, thus forming a huge cross of white flowers. At the time of my visit there were upwards of 2,000 blooms open; and one small branch, 15 inches square, was noticed, which had forty-two expanded flowers. Trained around the windows on each side are two beautiful plants of *Pyrus japonica*, which were also in full flower, the scarlet blossoms forming a nice contrast to those of the *Magnolia*. *J. G. Wilkinson*.

**GARDENERS AND STEAM LAWN-MOWERS.**—Your correspondent, Mr. R. M. Newbury (p. 464), of the garden being kept as a place of quiet refreshment. But what about the gardener, for whom he says half the motive-power of a 22-inch machine would be good exercise on a hot day? I would ask what strong and healthy man is likely to endure such labour for any length of time? Why, following the plough all day is play compared to it. I have had considerable experience with lawn-mowers of almost every make, and I have found an 18-inch machine (of the best make) quite enough for any two men to work all day, if they have to follow it up all through the season, unless the lawn is exceptionally even and clean. It is generally the poor man, with a large family dependent upon him, who has to submit to this excessive drudgery; and I have known several poor fellows whose lives have been made a misery to them thereby. It is all very well to go and spend an hour or so at the mowing-machine—one can walk away feeling rather refreshed; but it is another matter when the labour is constant. Mr. Mawson's opposition has probably done much good in making known to many the existence of such a thing as a steam or electric lawn-mower. *Alfred J. Knapp*.

**DOUBLE VIOLET LADY HUME CAMPBELL.**—This is the finest variety for outdoor culture, being much hardier in constitution than *Marie Louise* and others. It withstood the severe frost of 1894-95 in the outside beds here, its only protection being the snow, and it flowered profusely afterwards. The flowers resemble those of *Marie Louise* very closely, but the foliage is taller and stronger, and it does not suffer in hot summer weather so much as do some varieties. The first propagated plants are much earlier in flowering the next season. Those taken from frames, broken up, and planted out last season on April 19, were in full flower here on March 20 in a sheltered and sunny spot; others slightly divided and planted when the beds were cleared in the third week in June, are quite a fortnight later in flowering, although they are growing by the side of the others. It is well to remember when transplanting Violets into the beds in the autumn, that very little growth will be made before flowering. The plants should be placed fairly close together in order to cover the ground well in the spring. *W. H. Divers, Belvoir Castle Gardens, Grantham*.

**AUTUMN-FRUITING STRAWBERRIES.**—The note on this subject brings up an old grievance against many of your correspondents, i.e., the place where the experiments were made is frequently not stated. England, Ireland, and Scotland have not one universal and uniform climate and soil; things which are possible in the west are impossible in the east; and a plant grown successfully in Devon and Cornwall may prove a failure in Aberdeen or Stornoway. The place where an experiment is made, or a result obtained, must always be given if the majority of readers are not to be misled, and without this knowledge the chances of failure are too numerous to make the trial worth repeating. *Thos. Fletcher, Grappenhall, Cheshire*.

**POSOQUERIA LONGIFLORA.**—I read the note on this plant in a recent issue with pleasure. In all my peregrinations, I do not remember to have seen plants of it in cultivation. Why that is so, is difficult to account for, considering its many fine qualities; and even when not in flower, its foliage and habit of growth are more ornamental than many other occupants of the plant-stove. We have no plant that surpasses it in its flowering season. At Nostell Priory there is in one of the stoves a large specimen in a pot which always flowers well in the spring months, and whose perfume pervades the house. Visitors never fail to admire the plant when they chance to see in bloom. *J. Elster, Nostell Priory Gardens*.

**PHALÆNOPSIS SPECIOSA.**—This species, through an error, appeared in the list of "Hybrid Orchids" published on p. 431 in *Gardeners' Chronicle* for April 4, 1896, as a "natural hybrid" between *P. Luddemanniana* and *P. tetraspis*. Major-General

Berkeley, who was the discoverer, and the only successful importer of this plant, in a note on the matter, says that neither *P. Luddemanniana* nor *P. tetraspis* grow on the island where he found *P. speciosa*. This species is described and figured, together with the varieties *Imperatrix* and *Christiana*, at p. 745 in *Gardeners' Chronicle* for December 9, 1882, by Professor Reichenbach. *H. J. Chapman*.

**CATTLEYA × EMPRESS FRIDERICK** (C. Mossie ♀, Dowiana ♂), one of the finest hybrids that has ever been raised, appeared on p. 10, *Gardeners' Chronicle*, July 6, 1895, as having been raised by Messrs. F. Sander. This is a mistake. The plant was raised by Mr. Seden, in the nurseries of Messrs. J. Veitch & Sons, and passed into the collection of Baron Sir H. Schroder, The Dell, Staines. *H. J. Chapman*.

**THE WINGED ELM.**—I might supplement the article on the above by stating that the Winged Elm is an excellent tree for planting on exposed and wind-swept ground, and good examples of it may be seen within a hundred yards of what was known as Cook's Quarry, at fully 600 feet altitude, on a spur of the Snowdon range of hills. It does well at Penrhyn Castle, and has there attained to fully 40 feet in height on the margin of a disused gravel-pit. *A. D. Webster, Bozemoor*.

**FORMING HERBACEOUS BORDERS.**—I do not think the wording herbaceous border can properly be designated a "misonomer" on the grounds furnished by Mr. Crump at p. 465, seeing that pretty well ninety per cent. of the subjects growing therein are herbaceous plants in every sense of the word, and the appellation "mixed border," which your correspondent thinks would be more accurate, would be somewhat vague and inappropriate under the circumstances indicated. A "mixed border" of what? A herbaceous border in which bulbs—say, to the extent of ten per cent. are planted, is still a herbaceous border, nothing more or less. I certainly should have no hesitation in disqualifying an exhibitor who happened to stage spikes of flowers of bulbous plants in a class for "herbaceous" flowers, as one is quite distinct from the other. I quite agree with what Mr. Crump says about the effectiveness of bulbs planted in grass when in flower, as we have several acres so planted in that portion of our grounds known as the "underwood," or wilderness—in which, among the trees, alongside of walks, &c., masses of Snowdrops, Daffodils, Bluebells, Crown Imperials, &c., show off to great advantage—the lines of Snowdrops on either side of the walks extending about three miles in the aggregate. In conclusion I may say, that all herbaceous borders that I am acquainted with include more or fewer bulbous plants—*Lilium candidum* (common garden Lily), *Hyacinthus candideus*, &c. *H. W. W.*

**FRUIT BOTTLING MADE EASY.**—Some such phrase as this is, may well be applied to the simple and almost automatic capsule Mr. G. V. de Luca brought before the Fruit Committee at the recent Drill Hall meeting, and to which a Bronze Medal was awarded. The principle is very simple, and the method seems to be extremely efficacious; whilst once possessed of the bottles and appliances, it is possible for any housewife to preserve whole her own fruit, whether home-grown or purchased, with the greatest ease. There have been many apparently simple methods for sealing down bottled fruit presented from time to time, and judging by what is seen in the products of the trade preservers, with complete success; still none seems to have been entirely adapted to meet the wants of the household where fruit bottling is done in an amateur fashion. In the case of the Luca capsule it seems impossible to go wrong, because so largely automatic. Bottles can be purchased, with capsules to fit, at very moderate prices. They are stout, and with ordinary care should endure for many years. They can be had in varying sizes admirably suited for domestic requirements, or for particular kinds of fruit. The principle of the capsule, which is of metal, is that in heating the fruit in the bottles, a vacuum is created, and the moment that is done, the external air pressure fixes the capsule so tightly, that it is not only air-tight—through the help of a small india-rubber band or ring which is fixed just beneath the capsule flange—but cannot be liberated until external air is admitted, by forcing a small hole through the centre of the capsule by the aid of a small bradawl or large needle; when the air pressure being removed the capsule is at once liberated. The hole thus made in the capsule can be closed again with the help of a drop of hot solder. The fruits are placed in the bottles closely packed, and, just as

may be desired, have the fruit covered with either cold water or syrup. The bottles are then stood in a large pot or deep stew-pan, which also contains cold water, and is stood over a slow fire. The capsules, with rings of rubber, are placed on to the mouth of each bottle, and held in place by spring holdfasts. The water in the pot is gently boiled, and the pot is at once removed to cool the water. When that is done, it is found that the steam generated in the bottles has expelled the air, because the automatic capsules are then not fixed; but the moment the steam condenses, and thus creates a vacuum, the capsule, hermetically under external air-pressure, seals the mouth of the bottle, the spring holdfast is removed, and the process is complete. Then, as before said, it is but needful to pierce a tiny hole in the centre of the capsule to admit air, and the capsule at once loosens. So far as present knowledge goes, this method seems to be about the easiest and most elementary one known in relation to fruit preserving. It has special value in households where bottling is neither sufficiently understood nor practised. It is true that bottled fruit may be purchased very cheaply, but that need not absolve the housewife from performing similar work in thousands of homes. It is specially valuable practice where fruit is abundant, and, but for such preserving, might be practically wasted. In our fruit culture we think far too much of market sale and profit, and not nearly enough of home use. That is a point to which greater attention should be directed, and this new and interesting appliance may do much, if widely known, to encourage domestic preservation of fruit by bottling. *A. D.*

**THE STEAM LAWN-MOWER.**—The fact that steam is being put to a good use in propelling the heavy, lumbering mowing-machine of cast-iron and steel is getting up heat among those who suppose that much-valued quiet of the garden is going to be disturbed for ever and aye by the snorting, smoking, abominable thing working all day long, and always just in front of the drawing-room windows. How long, I should like to know, would the gardener be allowed to indulge his mechanical tastes, if he had any, by thus arranging the hours during which the mowing is executed? He would soon be told that as the machine was capable of doing much more work in a shorter space of time than a pony or manual machine, he must get the mowing finished off in those hours when the inmates would be least disturbed by noises. This is the case now with mowers of the present type; and the rule as to machine-mowing was very stringently enforced in those days before the watch-chain gearing was fitted to the driving-wheels of mowers. With perfectly-fitted, smooth-running gearing, and smokeless fuel or electricity, the newest mowers should certainly make less noise and disturbance than the pony-machine, besides being a gain to the gardener in the short time occupied with the work. *Rusticus*.

**DAFFODILS POISONED BY SOOT.**—In the autumn of 1895 I put in boxes a large number of Daffodils for forcing. Soon afterwards, a large sack of fresh soot was delivered, and placed temporarily against one of the boxes, and subsequently fell across one end of a box remaining upon the soil for several days. During the time it was in this position we had one very wet night, when the rain fell in torrents. When I observed the position of the soot, I had it removed at once, and for this time forgot the occurrence. The growth of Daffodils this season has been excellent in every way with the exception of a portion of a large box, from which I was not able to gather a single flower of any worth. The bulbs being of my own stock, I knew they were healthy, and had concluded that the soil at one end had in some way been poisoned. It was distinctly a case of poisoning, inasmuch as the usual symptoms of disease were absent, by the wretched and contorted form of the flowers in their vain endeavours to struggle forth. In February when clearing out the boxes, I made an examination of the bulbs and soil. The bulbs were of first size, and had made abundance of roots, but the soil was more like soot, and nearly black. This fact reminded me of the circumstance alluded to above, and which to my mind is obviously a case of soot-poisoning. *J.*

**STRAWBERRY ROYAL SOVEREIGN.**—There are probably few, if any, cultivators of forced Strawberries who have not now given this variety a trial. Should there, however, be any such, I can without hesitation recommend it to them, as it responds admirably to that kind of treatment. I have not tried it as a first early, having hitherto depended upon *Vicomtesse Héricart du Thury* and *La Grosse Sucrée* for that purpose, but I had it in splendid con-

dition by the last week in March. Its fruits are very large, conical in shape, brightly coloured, and of rich flavour. It is, moreover, firm in texture, an important property where fruit has to be sent a distance. The habit of the plant when forced is not compact, as the leaf-stalks and flower-spikes are long. These are, however, matters of small moment, and in respect to the long flower-spikes it is advantageous to be able to easily expose the fruit to the air. Last season, owing to the hot summer and mild autumn, an unusual number of plants burst into flower in late autumn; particularly was this the case with early-potted *Vicomtesse Héricart du Thury*, and President was not exempt from this failing. *Royal Sovereign*, however, showed no fruit, neither were any of the plants "blind." Its constitution is strong, and it yields runners freely. I have not forced *Stevens' Wonder*, but have a plantation of it for layering from this year. Will anyone who has given it a trial for forcing, kindly state their experience with it? *Thos. Coomber*.

**PROTECTING PEAS FROM THE BIRDS.**—No doubt many of your readers suffer from the depredations of birds on Peas in pod, but I do not think it is generally known that birds are kept off by crossing the rows with black or white thread at a distance of 12 or 15 inches apart. I did this last year, fastening the thread to the Pea-sticks here and there to keep it up, and found hardly a pod was touched by the birds. Of course, every one knows about netting, and cotton is, no doubt, much used to protect the Peas when just commencing to grow; but I do not think it is widely known that black or white thread, preferably the former, is so effectual in protecting the pods. *S. J.*

## SOCIETIES.

### ROYAL BOTANIC.

APRIL 14, 15.—On Tuesday last was opened an exhibition of Daffodils in the gardens of the Royal Botanic Society, Regent's Park, and in connection therewith a Conference was held in the lecture-room of the Museum. The exhibition itself was not an extensive one; nevertheless, there were several very large and representative collections from members of the trade. It was in the competitive classes that the weakness of the display was most apparent, and in many instances there lacked any real competition. The Silver Cup offered by Messrs. P. Barr & Son for the best collection in the leading class was withheld, and the better of the two collections shown was awarded the 2nd prize only. There are several explanations for the paucity of exhibits. No doubt the arrangements for holding the exhibition were not undertaken so long beforehand as is frequently the case when large conferences and shows are concerned. Again, in many gardens the majority of the Daffodils have passed, and it is very likely that a fortnight ago would have proved a more convenient date for the competitors. Several of the exhibits came from Scotland. The comparative meagreness present in the Daffodil classes, however, was in some measure compensated by a good number of exhibits from nurserymen and others of a miscellaneous character. As may be seen below, there were first-class collections of Roses, Hippeastrums, hardy plants, &c., that played a useful part indeed in furnishing the stages that would otherwise have been empty. If the policy of holding periodical conferences be persisted in by the society, a greater share of success will doubtless attend succeeding efforts. The few competitive classes were not arranged in a manner convenient to the judges or the press.

### COMPETITIVE CLASSES.

The principal competitive class for Daffodils was one for a collection of flowers (not to include *Polyanthus Narcissus*). The 1st prize offered was a Silver Cup by Messrs. BARR & SONS; 2nd prize, the Society's Silver-gilt Medal; 3rd prize, a Silver Medal. There were only two collections exhibited in this class, and neither of these were deemed worthy of the 1st prize, which was withheld accordingly. The 2nd prize was awarded to Mrs. MARGARET CRAWFORD, Ardnamont, Scotland, who had a fairly representative, but not quite satisfactory collection, though we think it would have been more graceful had the 1st prize been given; Miss SPURRELL, Manor House, Norwich, was 2nd.

Dr. CRAWFORD was awarded a 1st prize in the class for eighteen distinct varieties, single flowers, five or more blooms of each sort (*Medio coronati* or Trumpet Daffodil). He had *grandis*, J. B. M. Cunn, rugilobus, albicans, W. P. Milner, Golden Spur, Glory of Leyden, Emperor, Horsfieldii, Mrs. Walter T. Ware, Major, Mrs. Thompson, Princess, Princess Ida, &c.

The best eighteen distinct varieties of *Medio coronati* (or

*Incomparabilis*, *Barrii*, *Leedsii*, *Buckhousei*, and *Nelsoni*, varieties), were shown by R. MAITLAND, Esq., Wardour Lodge, Sunningdale. He had *Duchess of Brabant*, *Stella*, *Nelsoni*, *Mayor*, *Mrs. Langtry*, *Barrii conspicua*, *Autoerati*, *Frank Miles*, *Leedsii* (type), *rugilobus*, *Kathleen Spurrell*, *Incomparabilis Leedsii*, *L. aurantius*, *Princess Mary*, *Flora Wilson*, *Jas. Bateman*, *Geo. Nicholson*, and *Mable Cowan*, and *M. Magdoline de Graaff*.

The 1st prize for a collection of Daffodils, in ten distinct varieties of the *Medio coronati* group, including *Incomparabilis*, *Barrii*, *Leedsii*, *Buckhousei*, and *Nelsoni*, was taken by Mrs. G. P. HAVDEN, Hatfield Vineage, Doncaster, who had very fresh clear looking flowers of much attractiveness. Mrs. MARGARET CRAWFORD had a similar award in the class for six distinct varieties of the *Parvi coronati* group (*Burbidgei* and *Poeticus Narcissus*).

The 1st prize for twenty distinct varieties of any kinds of Daffodils was won by Mrs. MARGARET CRAWFORD, who had also an equal award in the class for six distinct double

prize was awarded to an arrangement in which but very few blooms indeed were included, shown by Mr. A. P. YOUNG. The devices in which the blooms and ornamental foliage were placed were not without attraction, but there were decidedly fewer Daffodils used than there might have been, without making the appearance at all heavy. 2nd, Mrs. W. MOLE, 5, The Avenue, Kew. 3rd, Mr. J. PREWETT, 11, Lancaster Terrace, W.

An excellent display of dwarf-growing hardy plants in flower made by Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham, was awarded a 1st prize. Large well-grown specimens of *Primula Sieboldii*, in variety, a *P. cashmeriana*, and other species supplied an abundance of colour, and large masses of white were the groups of *Spiraea multiflora compacta*, and *Spiraea stilloides*. *Anemones apennina*, and *nemorosa*, the very dwarf flowering and pretty *Iris pumila inazurea*, *cerulea* and *atro-cerulea* varieties, *Ranunculus amplexicaulis*, a very free flowering species with fine white flowers, *Cypripedium pubescens*, and several varieties of

FIG. 76.—TRUMPET-DAFFODIL MADAME DE GRAAFF. (SEE P. 497, COL. A.)

varieties, in the latter case exhibiting *Capax*, *Orange Phoenix*, *Sulphur Phoenix*, *Butter-and-Eggs*, &c.

The finest Daffodil bloom of the *Medio coronati* section was the well-known variety *Sir Watkin*, exhibited by Mrs. MARGARET CRAWFORD. The same exhibitor had also the best flower in the *Magni coronati* section, showing a bloom of *Glory of Leyden*. Other 1st prizes obtained by this exhibitor were for ten distinct varieties of Trumpet Daffodils, six pots of Daffodils (distinct), and for the finest Daffodil in the show of the *parvi coronati* section.

A Certificate of Merit was awarded to a Trumpet Daffodil named *Cormoran*, exhibited by the Rev. WOLLEY DOD, Edge Hall, Mdpas, Cheshire. The long fine trumpet of this flower is rich deep yellow, and the perianth light sulphur-coloured.

The 1st prize for a bouquet of Daffodils was won by Mr. A. F. YOUNG, 15, Tower Road, Dartford. It was a very simple arrangement, and not exceptionally remarkable. Mr. W. GREEN, Jun., Harold Wood, Essex, was 2nd.

Miss L. HUDSON, Gunnersbury House, Acton, won among many competitors in the class for a bowl of Daffodils. She exhibited her flowers, however, in a vase rather than a bowl; while in the 2nd and 3rd prize exhibits low shallow bowls were used. Mrs. W. MOLE, The Avenue, Kew, was 2nd, and Mr. J. PREWETT, 11, Lancaster St., Bayswater, 3rd.

There were six exhibits of a table of Daffodils, and the 1st

*Saxifraga*, were some of the more noticeable in this representative collection, and there were a number of pretty forms of *Fritillaria* also, while *Adonis vernalis* made quite a patch of gold.

The only group of *Tuberous Begonias* in flower was that from Mr. T. S. WARE, Tottenham, but his collection was a very excellent one to be exhibited so early as April, and was awarded 1st prize; it contained many very pretty and commendable varieties. A double-flowered variety named *Miss Lila Lawford* is especially worthy of mention, being large in size, of fairly good form, and possessing the most lovely bright rose colour, with milky white towards the base of the florets. *Triumph*, a deep but wonderfully bright crimson double, and *Mrs. Robert Brown*, very delicate rose colour, and in shape also similar to a *Rose*, are likewise good. *Miss Alice Sparrow* represents a variety the flowers of which were not developed, but it appeared to possess a very unique shade of colour near to apricot-salmon.

Mr. RUMSEY took a 1st prize for six *Roses* in pots, with a collection including four *Tea* varieties, and capital plants of *Magna Charta* H. P. and *L'Idéale* (Noisette).

Mr. DOUGLAS, gr. to Mrs. WHITBOURNE, Ilford, Essex, was the winner of a 1st prize for a group of comparatively dwarf plants of *Cineraria* capitately flowered. The varieties of which many had names evidently belonging to an excellent strain,

Twelve *Hippeastrums* were shown best by Mr. Perkins, gr. to Hon. W. D. SMITH, Greenlands, Henley-on-Thames; Mr. Douglas also exhibiting well as 2nd.

The 1st prize for twelve *Auriculas* was well won by Mr. DOUGLAS, who staged a dozen well-flowered plants of good merit, many of them being seedling varieties.

#### HONORARY CONTRIBUTIONS.

A very imposing display of *Daffodils* was that from Mr. THOS. S. WARE, Halo Farm Nurseries, near Tottenham. In this collection the blooms were massed closely together, *Princeps*, *Emperor*, *Barrii conspicuus*, *Nelsoni Major*, *Burbidgei*, *cernuus pulcher*, *bicolor grandis*, *Sir Watkin*, *Burbidge*, *Model*, and others in large masses were very effective, and such varieties as *Glory of Leyden*, *Madame de Graaff*, and rarer kinds were represented by a few flowers. A large Silver Medal was recommended this exhibit.

The largest and most representative collection of *Daffodils*

and *Mabel Cowan* (*Incomparabilis*), a rather small flower, with finely shaped perianth, having good segments, and a pretty orange crowned cup. A large Silver Medal was awarded Messrs. BARR & SONS.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, contributed a group of *Narcissus* flowers, including very considerable variety. The groups or varieties were together, and each of these created a fine effect. The flowers generally had a brighter appearance, and the colours were clearer, than was the case in most of the collections of these flowers. We noticed numerous varieties of *Incomparabilis*, also *Humel*, *bicolor*, *Polyanthus* *Narcissus*, the deep yellow *N. maximus*, *Leelsii*, *Minnie Hume*, a splendid lot of *Emperor*, *Barrii conspicuus*, and the very fine *Poeticus* *Poetrum* (a large Bronze Medal was awarded).

Messrs. B. S. WILLIAMS & SON, Upper Holloway, London, staged a group of very fine *Hippeastrums* and *Cliveias* in flower, interspersed with *Boronia*, and graceful *Palms*, and faced with a band of *Adiantum Ferns*. *Empress of*

A few skilfully-wrought models of *Daffodil* flowers were exhibited by Mrs. R. A. EMERY, 6, St. Charles Square, Kensington, W., which were so nearly alike in appearance to real flowers of the varieties mimicked, that few of the visitors detected their spurious nature (Certificate).

#### DAFFODIL CONFERENCE.

Mr. J. G. BAKER, the Curator of the Herbarium, Kew, presided at the Conference, which was held in the lecture-room and museum of the society. In opening the proceedings, he observed that he did not propose to trouble them with many remarks, as he had said all he had to say on the subject in the *Gardeners' Chronicle*, 1869, and the general principles then laid down in his Review had been very little changed. Since that time he was very glad to see how enormously the *Daffodil* had increased in popularity. It was a democratic flower—a flower that responded to the careful attention of growers of all classes, and it was a most interesting flower from an artistic point of view. The first paper which would be read that day was by his old friend and colleague, Mr. Burbidge, and he had the pleasant duty of asking Mr. Burbidge to accept a Silver Cup presented by Messrs. Barr & Sons in acknowledgment of the great services he had rendered in popularising the *Narcissus*. Mr. Burbidge happily combined the three graces—"Literature, Science, and Art." Until Mr. Burbidge published his book in 1879—when he was quite a young man—there was no hook which dealt adequately with the *Daffodil*, and he was sure Mr. Burbidge was exceedingly gratified at the result of his labours as seen at that exhibition and throughout the country. He then handed the cup to Mr. Burbidge.

#### PAST, PRESENT, AND FUTURE OF THE NARCISSUS.

Mr. F. W. BURBIDGE, M.A., Curator of Trinity College Botanic Gardens, Dublin, read the opening address, and took for his subject "The Past, Present, and Future of the *Narcissus*." He said:—

In Egypt and in Greece, some of these flowers were well known and highly valued 3,000 to 4,000 years ago. There are to-day, in the Museum at Cairo, and in the Herbarium at Kew, actual dried specimens of *N. tazetta* and other flowers taken from mummy cases, well known to have been entombed fully 2,000 years before the Christian Era. These specimens prove that the *Narcissus* was a flower of value at such an early date, because people in all ages have laid their finest flowers in the grave with their dearest friends. The Egyptian mode of embalming and enwrapping, and the peculiarly dry climate, have alike favoured the preservation of these funeral wreaths in the most successful manner.

Students of eastern literature know that flowers enter into their languages in many ways. In Persian and Hindustani, for example, the word *Narcissus* is often used as typifying the eyes, Roses the cheeks, and Tulips are supposed to represent the mouth, just as Sloes, Roses, and Cherries were so used by the poets of pre-Elizabethan times. Kushal Khan, the poet of the Afghans, has a poem in which the refrain is always the same—

"Black *Narcissus* are thine eyes,  
Thou dear one, so beautiful, so gay."

Some etymologists tell us the root of the word *Narcissus* is *Narces* (= stupor), because the essential principle of these plants is a narcotic one. This connection, together with the eastern custom of connecting the *Narcissus* with the eyes, may be more subtle than we at first imagine; for what narcotic is so potent or hypnotic as the light of beautiful eyes!

The plant we call *Narcissus poeticus* is not the true *Narcissus* of the Greek and Latin poets at all. The real poet's *Narcissus* of Egypt, Greece, and of the east, is *N. tazetta*, and it is of this plant that the earliest and greatest poets of the world have sung. This is the *Narcissus* of Homer and Sophocles, and of all the early poets of south Europe and the east. This bunch or cluster-flowered *N. tazetta* is very variable, and it extends as a wild plant from the shores or basin of the Mediterranean, through Persia, Cashmere, and N. India, to China and Japan.

The purple-ringed *N. poeticus*, common in Italy, was given the honour of being the true *Narcissus*; while the *Daffodil* (or *N. pseudo-Narcissus*) was stigmatised as the false or spurious kind. Modern researches point to the fact that if any *Narcissus* at all was seen and sung by Homer, Sophocles, and Bion, it was decidedly *N. tazetta*, and not *N. poeticus*, which, as a wild plant, is not known in Greece. This, without a doubt, is the flower *Persophone* pulled in G-edian meadows; this the one that Helen of Troy and Cleopatra wore for its subtle fragrance in their sun-kissed hair, just as do the daughters of Egypt, Greece, Persia, and Cashmere to this day. We may leave southern Europe and the East and come nearer home. The only *Narcissus* really native to our English soil is the Lent Lily—the *Daffodil* that "comes before the swallow dares"—*Narcissus pseudo-Narcissus*. All the others are simply aliens naturalised, or their offspring bred as hybrids on our shores.

But how, when, and where did the European *Narcissus* first come over to us? It seems natural to assume that they were brought either by our own first voyagers to Europe or their

FIG. 77.—TRUMPET-DAFFODIL GLORY OF LEYDEN. (SEE COL. A.)

was one from Messrs. BARR & SON, King St., Covent Garden. Doubtless there were very many of the best varieties in each section represented in this large display. We noticed at least thirty choice ones. Certificates of Merit were recommended to the following:—Mrs. C. Bowley (*Burbidgei*), with pale perianth segments but not quite sufficiently clear, and a pretty orange-coloured cup. *Madame de Graaff* (see fig. 76) a very lovely trumpet flower with pale lemon trumpet and lighter perianth, the mouth of the trumpet reflexed evenly, and a very distinct flower; *Weardale Perfection*, of which three magnificent blooms were exhibited in Messrs. BARR'S stand. The large and well-formed trumpet of this flower is a very pretty yellow, with pale sulphur-coloured perianth; the flower has good substance, and the segments of the perianth are wide, making the flower an excellent one. *Queen of Spain* (*Johnstoni*), a flower of a uniform shade of yellow, in form not unlike *N. triandrus*, but much larger. *Glory of Leyden* (see fig. 77), trumpet rich golden yellow, and the perianth a mixture of sulphur and yellow colour, trumpet prettily fringed. *Madame Plomp*, rich golden-yellow trumpet and light sulphur-coloured perianth, a smaller flower and differing in form from the preceding one. *Commander* (*Incomparabilis*), light sulphur-coloured perianth, with fine orange-coloured cup prettily fringed. *Dorothy E. Wemyss*, a flower with very large pale perianth, crown or cup very deep orange, a capital variety;

*India*, *Dazzle*, *Distinction*, *Holloway Belle*, *General Bouanger*, and *Dr. Masters*, were the best varieties of *Hippeastrum*; and *Ambrose Verschaffelt*, *Martha Reimers*, and *Firefly*, were the varieties of *Cliveias* (Large Bronze Medal).

From Mr. FRANK CANT, Braiswick Nursery, Colchester, was exhibited an excellent display of Rose blooms, including four large boxes, each containing twenty-four flowers. The varieties were numerous, and represented 11 P.'s, *Noisettes*, and *Teas* in capital style (Small Silver Medal).

Mr. JOHN WALKER, Thame, Oxon, was the exhibitor of forty-eight fine flowers of *Marichel Niel* Roses, twenty-four blooms of *Niphetos*, and a number of *Garden*, *Noisette*, and other varieties, shown in bunches of expanding buds (Large Bronze Medal).

Messrs. B. S. WILLIAMS & SON, Upper Holloway, London, made an exhibit of various shower bouquets of *Daffodils*, also baskets of same; and as an unusual novelty, there was a lady's hat, green in colour, with pale yellow bow of wide riband, and profusely furnished with *Daffodils*! A basket of *Roses*, and a bouquet of *Lilies of the Valley* were pretty (Bronze Medal).

Mr. WM. RUMSEY, Joyning's Nurseries, Waltham Cross, Herts, staged a very commendable group of *Roses* in pots on the floor of the large conservatory. Boxes of cut blooms faced the group and a band of *Adiantum Ferns*. A large Silver Medal was awarded.

return, or that foreign immigrants to our island brought them to us.

Now as European and Eastern civilisations were far ahead of ours down to the times of Elizabeth at least, I think we may assume that they were brought by people who knew of them and appreciated them for their medicinal uses or for their beauty before we did so ourselves. Assuming they were brought, there remains when and where to be considered.

Now the first records of trade and civilisation in our islands takes us to Cornwall and St. Michael's Mount, to which islet the Phœnicians and the Jews came to barter their products for our native tin; and from personal investigation, I believe that to Cornwall first of all the Narcissus of the South and East of Europe were brought by the early traders.

No other soil and climate in the British Isles suits these flowers quite so well as that of Cornwall, and it was the early-blooming *N. tazetta* growing so vigorously and flowering so early and so profusely on St. Michael's Mount, that led to the cornucopia trade now carried on in these exquisite flowers in the Scilly Islands of to-day.

*The Present.*—The mention of the Scilly Isles brings us to the present day interest of the Narcissi, for in Cornwall—bereft to-day of its monopoly in tin—and in the Scilly Isles, the Narcissus is the most profitable crop grown.

A crop of Narcissus to-day, on soils and in climates that suit these flowers, is like the ideal sheep-farms of the past—you get two or three profits from the same source. In the case of sheep, before Australian mutton and Australian wool, we had in England—mutton, and lambs, and wool; and so the Narcissus farmers to-day have done well on a double profit crop of cut flowers and dry bulbs. Given the best conditions of soil and climate, and special intelligence or knowledge of good culture and the best markets, and Narcissus farming is an Eldorado of its kind. But the business is like a puzzle lock—all the rings, or factors, must agree together, or focus as it were, or you will lose money even in Narcissus farming.

I believe I am correct in saying that the growth of the best fruit is even more profitable than growing the finest of Narcissi; and I say this with trepidation, because it looks as if men and women to-day valued something to eat, more than they value the most beautiful of flowers.

It is the successful grower of Narcissi and other flowers, who in one sense is an artist—a minister—who brings freshness and sweetness, and light or beauty, into the homes of the people. I dearly love all our thoroughly hardy, thoroughly national, or what I may be permitted to call "democratic" flowers. They are really worth keeping in a double sense. Such are the Narcissi that "come before the swallow dares."

I have hinted more than once that the Narcissi are not only beautiful but profitable as well. After all, this is merely a foregone conclusion. "Take care of the beautiful," said the wise Greeks, "for the good and the true will take care of themselves;" and this is what the Narcissi have done for themselves, and we in helping them have reaped a rich reward.

Near Boston in Lincolnshire, all around London, and in Cornwall and the Isles of Scilly, the culture of Narcissi has really been the salvation of tenant and landlord alike during the past ten or twenty years.

The moral of land culture in England seems to be this, our corn, and wine, and oil—in a word, our food and clothing, can to-day be grown for us and brought to us, more cheaply than we can do it for ourselves, but our beautiful flowers can be best grown at home. An acre of Wheat, or an acre of Potatoes, may be put down as worth from £20 to £30, according to locality and variety, &c., but an acre of choice Daffodils may be worth anything from £50 to £500, or even much more. Again, when glass-house shelter is judiciously added to the open-air culture of Narcissi, the gains are multiplied, as it enables markets to be supplied during bad winter weather, when open-air flowers are scarce, and flowers are at their highest value.

To give some idea of the traffic in Daffodils and other produce from the Scilly Isles, I may say, that on one day in March of this year, twenty-seven tons of these flowers were sent from that part to England; and on March 17th, 199 railway-trucksloads of Broccoli and Wallflowers were dispatched from Cornish stations in eight special trains. The flower trade in Scilly has been a growing one: 65 tons in 1885, 85 tons in 1886, 100 tons in 1887, 188 tons in 1888, and 198 tons in 1889; but during the past five or six years even this gigantic record has been exceeded. This record is for cut flowers alone, and in addition many bulbs have been sold, and from actual trial I can say that the best Narcissus bulbs from Scilly and from Ireland are finer and healthier, and more floriferous, than those from the Continent or elsewhere.

In a word, we are progressing in bulb culture and can grow Narcissi, Crocus and Tulip roots quite as well in Great Britain and Ireland as it is possible to produce them elsewhere. This is a most important point, and may have a wide-reaching influence on our land culture in the future.

*The Future.*—Now, what is to be the future of our favourite flower? It is an old proverb, "Never prophesy unless you know," but, if "coming events cast their shadows before," then at least we may observe the shadows! And as I see them, the shadows form a good augury for our favourite Narcissi.

Flowering as they do in early spring, shelter is for them a great necessity; and shelter from wind and sea-spray, absence of severe frosts, and abundance of winter sunlight, are the secrets of success in the Scilly Isles. The mean winter temperature in the Scilly Islands is as high as that of many places in S. Europe.

The future of the Narcissus industry will consist of a more rigid selection, and the rearing of kinds far better than even the best we have at the present time. In a word, it is not so much extension as improvement that is necessary. It is easier to increase existing kinds of moderate quality than it is to rear new seedlings better in all ways than are the best of the older ones.

There are in all twenty to thirty wild species of Narcissi known to botanists, but of these five or six only are of use to those who rear Narcissi for our gardens and the flower markets.

1. The Daffodil (*N. pseudo-Narcissus*), N. W. Europe.
2. The so-called Poet's Narcissus (*N. poeticus*), S. W. Europe.
3. The true Poet's or Bunch-flowered Narcissus (*N. tazetta*), S. Europe to Syria, Cushman, N. India, China and Japan.
4. The Jonquil or Rush-leaved Narcissus (*N. jonquilla*), S. W. Europe.
5. The Reflexed Narcissus, or Angel's Tears (*N. triandrus*), S. W. Europe.

These five species, with their hybrid offspring, really give us all the countless phases of inter-mixed garden Narcissi. The species all come true from seed, and they all hybridise freely with each other, as Herbert proved in the past, and as the Rev. G. H. Engleheart has proved, and is proving for us to-day.

*N. pseudo-Narcissus*, *N. poeticus*, and *N. tazetta*, are the three great species, forming, as it were, the backbone of the race now popular and profitable in our gardens. All the other fifteen or twenty wild species may be grown, and they may be hybridised, but their progeny is not hardy enough, and showy enough, and productive enough, to merit what I may call rough-and-tumble cultivation in the garden or on the flower farm.

Looking around the Narcissus here to-day, you may naturally ask me, what do you want that is not already obtained? Well, we want substance, flowers of stout texture that will carry well, and endure longer than even the best now known. We want a golden flower like *N. maximus*, or even like *N. obvallaris*, that will grow more freely in all soils, and flower more profusely than these now do.

Then we want colour—tricolors it may be, instead of bicolors, or at least we want Horsefield's Daffodil with an orange or scarlet trumpet.

It is suggestive that our highest coloured kinds—those having red cups, are hybrids of *N. poeticus* and *N. tazetta* with varieties of the Daffodil, such as N. C. J. Backhouse, N. Mary Anderson, N. Queen Sophia, and various forms of Barrii or Burbridgei.

The most pure and brilliant varieties as yet raised were obtained in Ireland some years ago by Mrs. Lawrenson between *N. princeps* × *N. poeticus*, and have crane-like white perianths and scarlet crowns, and so far these are the earliest and highest-coloured of all the hybrids known to me. Good form and good colour also will be obtained by crossing the finest formed wild Daffodils of France and Spain with the most shapely and highly-coloured *N. poeticus*. It is also most conducive to success if pollen is used from flowers grown at some distance from the seed-bearing parents.

The vigour of wild parents is sometimes far greater than is that of garden-grown specimens, and there is not much advantage in trying to cross the finest of garden hybrids together. Crosses between "Sir Watkin" and "John Horsefield" for example, give but poor results.

The natural tendency of wild plants is to improve under garden culture, but the best of garden seedlings seem to be at a tension point, so long as they are well grown and undisturbed, but if you re-hybridise them, they frequently seem glad to revert, rather than to improve—i.e., atavism seems to overcome the power we call evolution.

Every one who grows Narcissi in suitable soils and climates, where they seed naturally, should hybridise their best kinds and rear seedlings.

The finest bicolor Daffodil, "John Horsefield," was raised by a Lancashire hand-loom weaver, in a little back garden; and the finest white Daffodil, "Madame de Graaff," is a lucky chance seedling, reared by Mynheer Simon de Graaff, in his nursery at Leyden.

The main point is to multiply the natural chances—keep on crossing, and keep on raising seedlings. Constant increase by seed means new life and added vigour, and often additional beauty or usefulness as well.

Constant vegetative increase by offsets or bulb division, more often means a loss of vigour, unless the offsets are constantly replanted in fresh soil, and even then there is no chance of variety.

#### THE CULTIVATION OF NARCISSI BY AMATEURS.

The Rev. E. S. BOURNE (Dunston Vicarage, near Lincoln) read a paper on this subject. At the outset he said that a general rule should be that a portion of the garden should be set apart, so that the flower may receive special attention, and not merely share the attention bestowed on the garden as a whole.

*Soil.*—The most important matter was to be careful to secure good drainage. It was quite true many robust kinds will flower almost anywhere, but Narcissus bulbs as a rule resent being water-logged. The best soil is a good loam of medium consistency and a certain amount of grit.

*Situation.*—This should be shaded, or partially shaded, during the hottest part of the day, but the flowers should be able to get some sun in the morning or afternoon. The bed should be raised 4 inches above the level of the garden, and

the surface should slope so as to be protected from winds. Mr. Bourne finds that the White Trumpet Daffodil gets on better when it has to make a struggle for existence, and he has some which have done wonders when the bulbs had been sown among the roots of shrubs.

*Time of Planting.*—Every bulb should be in the ground as early as possible in August. The maxim should be—"Plant early." The surroundings should be fairly solid, and the planting should be done when the ground is nicely moistened by showers, and not when it is soddened. The depth, as a general rule, should be from  $\frac{2}{3}$  to  $\frac{3}{4}$  inches below the surface, and the bulbs should be placed gently but firmly on the ground so that there should be no air space beneath.

*Nourishment.*—The rows should be sufficiently wide apart to allow of hoeing. Great care should be exercised in the use of manure. This should be very old horse-manure, and should be applied as a mulch in autumn. Some varieties resent the use of manure.

*Lifting.*—After three years they should be lifted if fine flowers were wished for; and as by separation each bulb would get plenty of room for nourishment, strong sorts should be frequently lifted. The proper time for lifting is when they are ripe and at rest. That period is very short indeed, but the maxim to be followed is better to be too early than too late. The exact time can only be known by observation and experience. Generally, the beginning of July was a very good time, in the Midlands. In the South of England it would be a little earlier. The best varieties should not be pulled but cut apart. The bulbs should not be exposed to the sun, and should be placed in a cool place, under cover to dry gradually, and then afterwards they should be kept in some cool, dry, airy room. He did not generally keep his out of the ground more than a month.

*Varieties.*—The lecturer impressed upon beginners the old maxim that the best was the cheapest in the end. The grower should not hamper himself with inferior qualities which cease to be of any value in a short time, whereas one good stock would in the same time become more valuable.

#### THE DAFFODIL IN ART.

Mr. W. J. CAFARS (Oundle) dealt with the subject of the Daffodil in art. He illustrated his discourse by drawings of many old coloured prints of Daffodils, dating back to five or six centuries [?]. He displayed quite a paternal fondness for the flower, and pointed out its innumerable beauties. He said he had come to the conclusion that when there were Daffodils in all their perfection there was no art to make them known. When we had the art there were no Daffodils, but now we had both Daffodils and art, Daffodils would live through art.

#### THE DAFFODIL AS AN EXHIBITION FLOWER.

Mr. J. D. PEARSON contributed an interesting paper on the Daffodil as an exhibition flower. He dealt with the method of treatment of exhibition blooms, with their cutting, packing and arrangement. He gave some useful information with respect to suitable vases for house decoration. He said one great point was that flowers should be exhibited in their natural positions, as, to the artistic eye, there was nothing more painful than to see beautiful blooms twisted out of their natural forms on wire frames. The Daffodil, for instance, was often seen exhibited with the trumpet staring one in the face, whereas it would, if permitted, always modestly droop its head.

#### THE DAFFODIL IN DECORATION.

Miss MARIE LOWE read a paper on the Daffodil from a decorative point of view. She alluded with deep regret to the poorness of present-day decorative arrangements. The history of the Daffodil in design, she asserted, had yet to be created. Blooms need not necessarily always be displayed in foliage when natural foliage was scarce, nor should they be packed in vases in great bunches. They certainly in that case gave a great display of colour, but the individual blooms were crushed out of all shape. She impressed upon her hearers that flowers should never be put into vases which bore floral decorative designs. In every such case the whole decorative effect was spoilt.

#### THE BASAL ROT.

Dr. CRAWFORD contributed a paper, which, in the author's absence, was read by Mr. Sowerby, the Secretary of the R. B. Soc., on "Basal Rot and the conditions necessary for the healthy culture of the Daffodil." Dr. Crawford said of all the difficulties met with in growing the Narcissus either on a large scale for commercial purposes or on a small scale for pleasure, none was so disappointing as that insidious decay which the Rev. Wolley Dod was the first to describe and call by the name of basal rot. The whole question of the successful culture of the Narcissus was intimately bound up with this fact, for while an occasional bulb might go down before the ravages of the Narcissus-grub, whole plots of certain varieties might be swept away in two seasons by the decay. He had proved that the Narcissus flourished best in virgin soil, for our own Lent Lily, which had a wide distribution over the whole of the western counties of Scotland, was found in its greatest luxuriance in the sloping glens where the soil had been undisturbed by the hand of man. When the plant was put into cultivated soil it went down immediately, and reasoning from that data they might arrive at the conditions for healthy culture.

Plant food largely consisted of four things—nitrogen, phosphoric acid, potash, and lime. Those four were essential

to all perfect plant formation, yet they found whole families of plants that had a special preference for one element more than another. The Narcissus was a phosphate and potassium-loving plant, and the slightest quantity of free nitrogen or ammoniacal compounds were poisonous to it. The first sign of a bad bulb was that of brown, thumb-like markings. The markings might be very slight. Such varieties should avoided however little they were marked, as they were already infested with the Penicillium, which was the cause of basal rot. This scourge might be conquered by yearly lifting. Placing round the bulbs when sown antiseptic screens such as rough sand, soil from the banks of rivers, and road grit, had been found to be only partially successful. He had found a layer of marl—pure carbonate of lime—most useful, as no germs could possibly be present in it. There was no doubt that Dutch growers largely saved their stocks by yearly lifting, and by ascertaining that the soil contained the elements necessary, and not antagonistic, to the life of the plant. The healthy culture of the Narcissus consisted in choosing a mellow soil, free from nitrogenous compounds, or in rendering the soil mellow by first growing on it a crop which would free it of nitrogen, and perhaps the best crop for that purpose was grass.

OTHER PAPERS.

Mr. W. ROBINSON contributed a paper on "The hardy Narcissus, and their artistic use for planting in grass, &c." Mr. C. W. COWAN dealt with "Successes and failures of growing Daffodils in Midlothian." Mr. C. STUART prepared a paper giving a description of the miniature Whitehall group of Daffodils and their origin, and dealing with the subject of "Crosses, and how the different varieties were produced;" and Mr. J. ALLEN gave an account of "Daffodil hunting in the Pyrenees." The papers of Mr. Cowan, Mr. Stuart and Mr. Allen will be published by the Royal Botanical Society in due course; and for the same reason that they were not read—viz., want of time—no discussion took place on any of the papers.

A Vote of Thanks was accorded to the writers of the papers. Mr. BIRKETT, Chairman of the R. B. Society's Gardens, proposed a vote of thanks to the Chairman. He took advantage of the opportunity to say that the Council of the Society were delighted at the result of the exhibition, and he hoped it would not be the last time that the Society would have the honour of meeting them again. He took upon himself the responsibility of saying that the Council would feel delighted to have conferences and exhibitions relating to other flowers as well as the Daffodil.

Major COTTON seconded the motion which was duly carried. The Chairman in responding said, although the weather had been against them, the exhibition and the conference had been a great success.

were (1) animal, (2) excrementitious, (3) vegetable, and (4) mineral substances. Dead animals were sometimes used, for Vines especially, in a raw state, but carcasses should be decomposed and mixed with earth to render their manurial value easily assimilable. Night-soil properly mixed with loam formed one of the richest fertilisers. Corporations sadly neglected their opportunities in this matter, and farmers had not realised the value of night-soil as manure. There were about 36,000,000 people in the kingdom, and reckoning the value of the refuse from each at 5s. yearly, the manure which was now so largely wasted was worth £9,000,000 annually. Destructors were condemned by Mr. EASTWOOD, who contended that night-soil should be properly prepared, and agri culturists encouraged to utilise it. Experts would be better employed in giving attention to this matter than in investigating and recommending artificial manures, which, he thought, tended to exhaust the soil, besides being so expensive. If night-soil were made the most of, nobody would lose, but everybody would gain by it. The difficulty was to avoid the eye-sore and nose-sore that night-soil deposits were at present. This could be done by providing proper sheds for storage, and if the manure were properly mixed and kept under cover, its value would be enhanced. All vegetable refuse in gardens should be collected in heaps, covered with earth, and allowed to rot before use. Lime was a valuable manurial agent, mixed with peat and fibrous loam, and burnt earth and sods, mixed with soot, burnt hedge-clippings, and drenched with house-slops. Mr. EASTWOOD also spoke of sugar-boiler refuse and ground bones as valuable fertilisers. Ground bones should be soaked with water, and by adding sulphuric acid and covering the heap with earth, a rich compost for Turnips and Potatoes would be produced. Great stress was laid by Mr. EASTWOOD on the necessity of preserving all compost from the rain and weather, otherwise its manurial value would be seriously depreciated.

Mr. H. S. GOODYEAR said that twenty years ago the Wakefield Corporation took up the night-soil question with some vigour, but after seven or eight years abandoned it because there was no demand for the manure by the farmers, and the operations resulted in a loss. There would be great difficulty in dealing with the enormous quantity of night-soil from the city by mixing it with loam, as Mr. HUDSON suggested; and as to mixing night-soil with ashes, he might say that he knew of acres upon acres around Wakefield which in a few years would be utterly worthless for agriculture or gardening, owing to being overloaded with ashes. He advocated the burning of all vegetable refuse, which would give potash.

Mr. CORDEN said the Manchester Corporation had for twenty years done a great trade in night-soil properly prepared, and made a considerable profit by selling it as native guano.

vases containing Narcissus blooms in about sixty varieties. The blooms in this collection, by means of wire holders, were made to appear stiff, but the foliage relieved the effect to some extent.

Messrs. J. R. PEARSON & SONS, of Chilwell, Notts, also had a fine collection of Narcissi, the blooms in which were arranged with foliage on a black velvet ground, and without wires.

Messrs. BARR & SON, King Street, Covent Garden, London, also sent a good collection of varieties of the same flower, including some of the rarer and less-known kinds.

Messrs. CURRIE & SONS, Highgate, London, staged a number of excellent plants in pots of the Rose Crimson Rambler, carrying an abundance of flowers; also a number of Boronias, Carnations, small Orange trees, carrying fruits, in pots; Ericas in variety, Azaleas, &c.

In the group of Messrs. SANDER & CO., St. Albans, was noticed the winter-flowering Begonia Gloire de Lorraine, Sarracenia flava, Cattleya citrina, Cymbidium Lowianum, Heliconia illustris rubricaulis, fine plants of Draecena Sanderiana, and miscellaneous Orchids.

Messrs. B. S. WILLIAMS & SONS, Holloway, London, staged a group of their Hippeastrums, also a collection of Cliveas, and a quantity of Mignonette in pots, Peonies, Azalea mollis, &c.

The effect of the above-mentioned groups, combined with the cut-flowers, was a most pleasing one, and it is hoped that the results of the exhibition will be a pecuniary advantage to this useful institution.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

ROYAL HORTICULTURAL.

Scientific Committee.

APRIL 7.—Present Mr. J. T. Bennett-Poë (in the Chair), Mr. Douglas, Rev. W. Wilks, and Rev. G. Henslow (Hon. Sec.).

Potato Perforated by a Subterranean Stem.—With reference to the specimen brought to the last meeting, it is said that the penetration was effected by the secretion of a solvent substance or ferment. This was the conclusion drawn by M. Prunet (Rev. Gén. de Bot., vol. ii., p. 166, 1891). On the other hand, G. J. Peirce would attribute the penetration to mechanical pressure, and not to the action of a diastatic ferment (Bot. Zeit., lii., p. 169).

Bitter and Bergamot Oranges from La Mortola.—Mr. Henslow exhibited specimens from the Marchese Hanbury. The former was raised by him from a pith of an Orange from a tree at Rome, said to have been planted by St. Dominic about A.D. 1200, which still exists at the monastery of St. Sabina. It is supposed to have been one of the earliest trees introduced into Europe. The Bitter Seville, or Bigarade Orange (Citrus vulgaris, Risso), is believed to have been the first kind cultivated. Mr. Henslow observed that the so-called "wild Orange" used for stocks in Malta bears a quite uncatchable fruit of a similar kind. The Bergamot is a small Orange (2½ to 3 inches in diameter). The peel is smooth and thin, abounding in essential oil of a peculiar fragrance, strongly suggestive of eau de Cologne. It is cultivated at Reggio, in Calabria, and is unknown wild. It first appeared in the latter part of the seventeenth century (Pharmacographia, p. 121).

Violets.—Mr. Henslow also showed some Violets from Mentone remarkable for their large size. When dried they were 1½ inch in diameter. They are commonly sold in the Riviera, but are mostly very deficient in scent. They may be the source of the Violet Princess of Wales, which is of French origin.

Fasciated Brussels S. roots.—Mr. Smee sent a very remarkable specimen. The stem was cylindrical at the base, but widened out into a broad paddle-shaped and flattened extremity, covered with minute buds. He also exhibited excellent photographs of the same.

WAKEFIELD PAXTON.

APRIL 2.—The Paxton Society met at its room, Wakefield, on the above date. Mr. J. EASTWOOD, Stanley, read a paper on "The Compost Heap." A gardener without compost, he said, was like a general without an army. There were many ways of making compost, but the most important materials

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

APRIL 9.—The Wolverhampton and Staffordshire Auxiliary Branch of this Society held their second annual show of spring flowers and decorative plants in the Drill Hall, Wolverhampton, on the above date. The Staffordshire Auxiliary, owing to the energetic action of the committee, has been very successful, and the amount subscribed to the parent society last year was something over £60. The spring show is held for the purpose of acquiring funds, and consequently no money prizes are offered, but in their stead diplomas are awarded. Amongst those who contributed to the display were the following—

The Right Honble. Lord WROTTESLEY (gr., Mr. Simpson), put up a well-arranged group of very miscellaneous character, Begonia semperflorans gigantea rubra profusely flowered, some finely-bloomed zonal Pelargoniums, White Stocks, Spireas, Deutzia gracilis, were included, as also were Dracaenas, Caladiums, Adiantum Farleyense, Ficus clastica, and Kentia australis.

Mrs. EARP, of Dunstall Hall, Wolverhampton (gr., Mr. Hugh Jones), staged a group consisting of well-bloomed plants of Azalea indica, Cologynne cristata, Cinerarias, Pandanus Veitchii, Primulas, Ferns, Coleus, &c.

Colonel the Honble. STAPLETON COTTON, Somerford Hall, Brewrod (gr., Mr. Ambrose), staged a grand well-flowered plant of Crinum latifolium, which was brought by the Colonel from Zululand after being engaged in the war there.

A group sent by Mr. BAKER, Waterdale, Wolverhampton (gr., Mr. Shingler), contained well-grown plants of Kentia australis, Azaleas, and other spring-flowering plants.

A group of well-flowered Orchids was sent by Mr. THOMSON, of Walsall, an amateur grower.

Of the local trade-growers, Mr. R. LOWE, Exchange Street, Wolverhampton, arranged a pretty group of plants, containing fine specimen Palms, Aralias, Goniolistas, Azaleas, Ferns, Hydrangeas, &c.

Messrs. TOM B. DODDS & CO., of Queen Square, Wolverhampton, staged a group of plants arranged with statuary, and containing Lilacs, tall Kentias, Lilies, &c.

Mr. JOHN E. KNOBT, nurseryman, Dudley Street, Wolverhampton, made a grand display of Palms and Azaleas in variety. This group contained a quantity of Narcissus Sir Watkin, and seedling Calceolarias.

Nurserymen from a distance included Messrs. JAMES VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, London, who exhibited a quantity of Narcissus in seventy varieties.

Mr. THOS. S. WARE, of Tottenham, London, staged 150

- 6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; \*Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending April 11, is furnished from the Meteorological Office:—

"The weather in the north of Scotland was unsettled and rainy throughout the week; in all other parts of the kingdom, however, the conditions were fair and dry until the period drew towards its close, when changeable, showery weather, with hail at times, extended to all parts of our islands. Thunder and lightning occurred at some of the Scotch stations during the night of the 10th.

"The temperature was considerably above the mean, the excess ranging from 3° in 'Ireland, S.' and the 'Channel Islands,' to 4° or 5° in most other districts, 6° in 'Scotland, E.,' and to 7° in 'England, N.E.' The highest of the maxima were registered either on the 7th or 8th, and ranged from 66° in 'England, E. and N.E.,' to 56° in 'Scotland, N.' The

lowest of the minima were recorded, as a general rule, on the 16th or 11th, when the thermometer fell to 31° in 'Scotland, N.,' 32° in 'Scotland, E.,' and to between 33° and 39° in most other districts; in the 'Channel Islands' the lowest reading was 44°.

"The rainfall was much in excess of the mean in 'Scotland, N.,' and just equal to it in 'Scotland, W.:' in all other districts, however, there was a considerable deficit.

"The bright sunshine exceeded the mean in 'England, N.E.:' but in nearly all other parts of the kingdom there was a deficiency. The percentage of the possible duration ranged from 44 in 'England, N.E.:' and from 33 in 'Scotland, E.:' to 19 in 'England, S.:' and to 13 in 'Scotland, N.:'

CULTURAL MEMORANDA.

PROPAGATING AUBRIETIAS.

GROWERS often complain of the difficulty experienced in successfully removing this plant after it has been used for spring bedding, and I have known it to be left in the beds throughout the summer owing to this reason. As it only forms a dull green mass during that time, it is not desirable. There is considerable risk of losing the greater part of the stock if it is much disturbed at the roots during hot, dry weather; and if the operation cannot be done at another time, the plants should be quickly replanted on a north border mulched with old Mushroom-dung or half-decayed leaf-soil, and attention given to affording water when necessary afterwards. A better practice than this is to raise a fresh stock of plants every year. Reserve a few of the plants when bedding-out in October, and pull these to pieces in April, securing a small amount of root to each division, and then plant out at about 9 inches by 12 inches apart on well-prepared ground in an open position. Small pieces, if so treated without delay, will make nice plants for filling the beds in the autumn, provided they are planted firmly and watered occasionally until they commence rooting. The variegated form is very useful as a carpeting plant or for edgings, but is much slower in growth than the green-leaved varieties. The best of the latter are *A. græca*, blue; *A. g. Leichtlinii*, crimson; and *A. g. Hendersoni*, crimson-purple. None of them can be depended upon to come true from seed; division of the clumps is the only sure means of increase. *H. H. Divers, Belvoir Castle Gardens, Grantham.*

VARIORUM.

SHOW AT NEWCASTLE-ON-TYNE.—The Durham, Northumberland, and Newcastle Horticultural Society held its spring exhibition at the Town Hall, and Corn Exchange, Newcastle, on Wednesday and Thursday last. It was of a particularly fine description, but owing to our lack of space, the report will be held over till next week.

PUBLICATION RECEIVED.—*Useful Notes for Travellers in Europe* (PITT & SCOTT, 25, Cannon Street, London, E.C.).

MEXICAN VEGETATION.—The Cuernavaca train, issuing northward from the Buena Vista Station, in Mexico City, first swings around to the west over salt meadows, then turns southward just back of the heights of Chapultepec, crowned with national buildings, to pass over Scott's battle-field of Molino del Rey, through Tacubaya and other suburban towns, most interesting with their magnificent villas, surrounded by parks and gardens, and over dry glades bristling with plantations of Magney. About ten miles out the foot of the Sierra de Ajusco is reached. Here, after passing through a scattered forest of Pinus leiophylla, a symmetrical tree of medium size, with the slenderest leaves and densest among Pines, we are confronted by lava-beds covering the mountain-side, and spreading for miles over the valley at its foot, a wild waste, almost impassable even on foot, black, brown, or red rock, but half concealed by vegetation. Down the slope innumerable streams of molten lava once poured, crowding upon and overrunning each other, heaping up ridges and hillocks

or ploughing out channels, seething and swirling, and, as they cooled, cracking into chasms, or, by upheavals of crust, forming frequent little grottoes. Right over this pedregal, through devious loops and up toilsome grades, our train mounts to the summit of the Sierra. To scan the scenes through which we pass yields intense interest. This pedregal is seen to be a preserve of plants from far and near. For beauty, it is like a flower garden. From nooks and crannies of the rough rocks, or from open patches amid masses of lava, spring Dahlias and Begonias, Senecios and Stevias, Pentstemons and Salvias, flowering shrubs and flowering trees—in every colour to make the scene bright and pleasing. On driest crags stand great Cotyledons and Sedums, and in the partial shade of little grotts rugged walls are softened by delicate Ferns. Thus, on a gigantic scale, Nature has here wrought at wild gardening with surpassing results. One catches glimpses of a thousand pieces of rock-work which the gardener would covet and long to transport to his city parks. Higher up the scene changes for a brief space to one of extreme desolation, where fragments of lichen rock strew the slope. Then, as we near the summit over such open slopes, our eyes turn to survey the Valley of Mexico, that wonderful valley, in the praise of whose beauty and grandeur the Spaniard exhausted the riches of his language. No better point of observation could be chosen. We are some 2000 feet higher than the level of the valley, and are here sitting at our ease in a railway train. Nothing obstructs our view of the entire valley some fifty miles in breadth. We look down upon the great city in its midst, with its 200 towers and domes; see the causeways, marked by bordering lines of Willows and Australian Gum-trees, which radiate from it across green meadows; count scores of villages nestling amid greenery and shade, and trace the shining lakes, white-rimmed by bare alkaline flats. We follow the complete circle of mountains which embrace this valley. Over against us in the south-east, and seemingly face to face with us at this height, dominating all the circle, stand the two great snowy mountains which are the crown of all the scene. *C. G. Pringle, in "Garden and Forest," March 11.*

MARKETS.

COVENT GARDEN, APRIL 16.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. BR.]

OLD POTATOES. Outlook very gloomy.

NEW POTATOES.

Very heavy arrivals are now due, both from the Canary Islands as well as from Malta. Prices for best Malta Kidneys 12s. to 16s.; ordinary, 9s. to 11s.; small, 7s. to 7s. 6d.; rounds, 8s. to 10s.; Canary Kidneys, best, 12s. to 15s.; ordinary, 7s. to 10s. per cwt. The prospects are good for an early season from Cornwall and Channel Islands. Jersey reports general gathering of their crops first week of May, and from the sheltered spots on 27th inst. *J. B. Thomas.*

SEEDS.

LONDON: April 15.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the market for farm seeds now exhibits a greatly improved feeling. The strong seasonable consumptive demand that prevails, coupled with an increasing speculative inquiry for holding over, and both acting on very moderate stocks and unusually low prices, has naturally brought about a good business. Red Clover seed especially shows marked improvement. For Trefoil, White, and other descriptions, the tendency is also upwards. There is no change in Tares. The trade for bird seeds is featureless. Peas and Haricots are decidedly more lively.

FRUIT AND VEGETABLES.

BOROUGH: April 11.—Quotations:—Savoys, 4s. to 5s., and Cabbages, 2s. 6d. to 3s. per tally; Onions, 2s. 9d. to 3s. 9d. per bag; Carrots, 2s. 3d. to 2s., and Turnips, 2s. to 2s. 9d. per dozen bunches; Horseradish, 1s. to 1s. 2d. per bundle; Apples, 4s. to 5s. per bushel.

SPIRALFIELDS: April 14.—Quotations:—Cauliflowers, 4s. to 6s. per tally; Cabbage, 1s. to 3s.; Bunch Greens, 2s. to 2s. 6d. per dozen; Spring Onions, 1s. 6d. to 2s. per dozen bunches; Leeks, 1s. to 1s. 6d. per dozen; Parsley, 1s. to 1s. 6d. per dozen bunches; Seakale, 8d. to 10d. per punnet; Broccoli, 9d. to 1s. per bag; Kale, 9d. to 1s. do.; Rhubarb, forced, 10d. to 1s. 3d. per dozen bundles; natural, 1s. 3d. to 2s. do.; Parsnips, 6d. to 8d. per score; Turnips, 1s. 9d. to 2s. per dozen bunches; Carrots, 2s. to 2s. 6d. do.; Turnips (per ton), 25s. to 40s.; do. Carrots, 21s. to 40s. do.; Apples, dessert, 7s. to 8s. per bushel; cookers, 6s. 6d. to 7s. do.; Cucumbers, 2s. 6d. to 3s. per dozen.

STRATFORD: April 14.—Quotations:—Cabbages, 4s. to 6s. per tally; Greens, 1s. to 1s. 6d. per bag; do., 1s. to 1s. 6d. per dozen; Cauliflowers, 1s. to 1s. 6d. per dozen; do., 4s. to 7s. per tally; sprouting Broccoli, 9d. to 1s. per bag; Beetroot, 4d. to 6d. per dozen; Horseradish, 1s. 1d. to 1s. 2d. per bundle; Parsley, 1s. to 1s. 6d. per dozen bunches; Rhubarb, forced, 10d. to 1s. do., field, 1s. 6d. to 2s. do.; White Turnips, 1s. 6d. to 2s. 3d. per bag; Leeks, 1s. to 1s. 6d. per dozen bunches; spring Onions, 1s. to 1s. 6d. do.; salad, 1s. 6d. to 2s. per dozen punnets; frame Cucumbers, 2s. to 3s. 6d. per dozen; Carrots, household, 2s. to 2s. per ton; do., cattle feeding, 14s. to 20s. do.; Parsnips, 3s. to 6d. per score; Mangels, 14s. to 18s. per ton; Swedes, 12s. to 16s. do.; Onions, English, 80s. to 100s. do.; do. Dutch, 3s. to 3s. 6d. per bag; do. Egyptian, 5s. to 6s. do.; Apples, English cookers, 5s. 6d. to 7s. per bushel; do. Nova Scotia, 18s. to 22s. per barrel.

FARRINGTON: April 16.—Quotations:—Cauliflowers, 1s. per dozen; Broccoli, 6d. per bushel; Greens, 6d. do.; Leeks

1s. per dozen; Soakale, 1s. per punnet; Cucumbers, 3s. per dozen; Mushrooms, 9d. per lb.; Horseradish, 1s. per bundle; Beets, 2s. per bushel; Tomatoes, 8d. per box; Parsley, 2d. per bundle; Apples, Tasmanian, 12s. to 15s. per box; do., American, 23s. per barrel.

**POTATOS.**

**BOROUGH:** April 14.—Quotations ranged from 30s. to 93s. per ton.

**SPITALFIELDS:** April 14.—Quotations.—Black lands, Bruce, 30s. to 40s.; Reading Giants, 25s. to 40s.; High lands, Main Crop Kidneys, 35s. to 50s.; Bruces, 35s. to 45s.; Drones, 45s. to 55s.; Saxony, 60s. to 80s.; Sutton's Abundance, 50s. to 65s.; Magnums, 35s. to 45s.; Imperators, 40s. to 50s.; Scotch Bruces, 40s. to 50s.; Main Crop Kidneys, 45s. to 55s.; Dunbars, 70s. to 80s. per ton.

**STRAATFOOD:** April 14.—Quotations.—Dark soil, Bruce, 20s. to 25s.; light do., 25s. to 60s.; Reading Giants, 30s. to 40s.; Sutton's Abundance, 20s. to 45s.; Scotch Main Crop, 40s. to 50s.; Dunbar Magnum, 60s. to 80s. per ton.

**FARRINGDON:** April 16.—Quotations.—Hebrons, white, 75s. to 85s.; Main Crop, 65s. to 70s.; Bruces, 40s. to 50s.; Magnums, 30s. to 40s.; Giants, 40s. to 50s. per ton.

**LONDON AVERAGES:** April 15.—Saxons, 70s. to 85s.; Dunbar Maincrop, 60s. to 75s.; Bruces, 60s. to 70s.; Sutton's Abundance, 45s. to 55s.; Maincrop Kidneys, 40s. to 50s.; Imperatoris, 25s. to 40s.; Magnums, 25s. to 35s. per ton; New Jersey and Guernsey, 3½d. to 4d. per pound.

**HAY.**

**Averages.**—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 6s. to 87s. 6d.; inferior, 38s. to 60s.; hay, best, 60s. to 85s.; inferior, 30s. to 55s.; mixture, 60s. to 80s.; and straw, 20s. to 40s. per load.

**CORN.**

**Averages.**—Official statement of the average prices of British Corn, imperial measure (qr.) for the week ending April 11, and for the corresponding period last year:—1896: Wheat, 24s. 6d.; Barley, 21s.; Oats, 13s. 1d. 1895: Wheat, 20s. 4d.; Barley, 21s. 3d.; and Oats, 13s. 11d.

**ENQUIRY.**

"He that questioneth much shall learn much."—Bacon.

Will any readers kindly inform me through your columns of the addresses of any continental growers of alpine and Pyrenean plants? I already know of Sunderman of Lindain, and Herr Gusnus, Klagenfurt, Austria.—H. Correvo, Geneva.

**ABUTILON:** T. E. S. The cross between a yellow variety and the white Boule de Neige has resulted in a showy large, striking flower, rather coarse, as seen, but which may become refined when grown from cuttings. A good variety for large conservatory, as covering for walls, pillars, tie-rods, &c.

**BOOKS:** A. M. C. *Fruit Farming for Profit*, by G. Bunyard; free by post, 2s. 9d., of F. Bunyard, 29, Week Street, Maidstone.—*Vines and Vine Culture*, by A. F. Barron (Publisher, 171, Fleet Street, E.C.). A pamphlet on *Cucumber Growing* is published by Upcott Gill, at 170, Strand, W.C.

**BOXES, &c.:** *Trec Fern*. If you will send your full name and address, we will communicate with you by letter.

**CARNATIONS DISEASED:** *Hawkstone*. Although there are as yet no external manifestations of the mould on your Carnations, we have no doubt, from appearances, that they are infested with the black mould, called *Heterosporium echinulatum*; see *Gardeners' Chronicle*, August 21, 1886, and 1870, p. 382. We can suggest no cure, since the plants are doomed when once affected; and the only preventive is to root out and destroy all infested plants for the protection of the rest. We do not imagine that fungicides will help at all in such an endophthal disease, but a copper solution might be tried as a forlorn hope. M. C. C.

**CORRECTION:** For name at foot of article on *Freesia refracta*, p. 458, for Hurt read Sturt.

**CATTELEYA-FLY** (see fig. 78).—*Three Correspondents*. The accompanying illustration will help you to identify the Cattleya-fly. The best way of getting rid of it is to cut off and burn affected roots and buds, and to search diligently both in the daytime and evening for the mature insect.

**DENDROBE:** X. Y. Z. You seem to have grown your *Dendrobium thyrsiflorum* remarkably well, but you expect too much from it. The plant having but one lead, the two spikes which are maturing are quite sufficient. Those which appear on the old imported pseudo-bulbs may have matured, if the others had not got the start of them. It is better to be content with one good leading growth than to have two indifferent ones. The same applies to the *Cattleya labiata*. The back eyes are only brought into use in case of accident to the leader. If you must propagate, cut the back bulbs off and crock them up.

**INSECTS:** P. W. A., W. Jones, J. S. The "worms" in your Peas and Beans are young millipedes (*Julus*). It is possible the eggs may have been in the manure, but it does not necessarily follow the same remedies as for wireworms. Try one of the approved insecticides for such cases, as what you have done appears of no avail. See that the earth is clean before making a fresh sowing. R. McL.

**NAMES OF PLANTS:** W. C. S. *Bifrenaria atropurpurea*.—L. C., *Manchester*. *Dendrobium super-*

FIG. 78.—THE CATTELEYA-FLY: ISOSOMA ORCHIDEARUM.

bum, commonly called in gardens *D. macrophyllum*.—*Paekham*. So far as we can judge by the single, rather dry, flowers sent, the small white flower is *D. barbatulum*; the other, *D. transparens*.—*In blue box*. No name. 1, *Cœlogyne cristata*; 2, *Dendrobium densiflorum*; 3, *Anthericum lineare variegatum*.—C. C., *Oxford*. 1, *Dendrobium Pierardi*; 2, *Celsia cretica*; 3, *Pulmonaria officinalis*.—C. L. *Fittonia Verschaffeltii*, often called *Gymnostachyum*, *Adiantum gracillimum*, and *Dendrobium superbum anosuam*.—Q. R. *Amygdalus nana*.—Mrs. A. J. *Prunus triloba*.—W. K. D. 4, *Cupressus* (*Retinospora*) *pisifera*; 5, *Morrea fimbriata*; *Rhododendron* next week.—P. K. 1, *Ilex latifolia*; 2, *Erica colonodes*; see fig. 74, p. 487; 3, *Olearia argyrophylla*; 4, *Leiophyllum thymifolium*; 5, *Andromeda polifolia*.—E. R. ? C. C. Paper-box packed with grass. 1, *Eranthomum*; 2, *Forsythia suspensa*; 3, *Spiraea*, not in flower; 4, *Amygdalus nana*; 5, *Lycium barbarum*. S. M. *Ornithogalum nutans*.—G. B. 1, *Dendrobium Heyneanum*; 2, D. *Pierardi*.—F. H. *Milton*. *Scrophularia vernalis*, a rare British plant. —C. Collett. *Lathraea squamaria*.—Petite. 1, *Brunfelsia americana*; 2, *Begonia glaucophylla*; 3, *Asclepias curassavica*; 4, *Cyperus laxus*; 5, *Carex brunnea variegata*; 6, *Lavandula dentata*.—H. G. D. 1, *Diosma ericoides*; 2, *Sempervivum tortuosum variegatum*; 3, *Pyrus* (*Cydonia*) *japo-*

*nica*; 4, *Diplacus glutinosus*.—F. M. C. 1, *Ribes aureum*; 2, *Forsythia suspensa*.—C. W. 1, *Erica herbacea*; 3, *Pyrus japonica*; 4, *Nuttallia cerasiformis*, see fig. 75, p. 489; 5, *Ribes aureum*; 6, *Forsythia suspensa*.—K. L. 1, *Epimedium pinnatum*; 2, *Asarum europæum*; 3, *Ilesperis matronalis*; 4, *Omphalodes verna*; 5, *Linaria cymbalaria*; 6 and 7, *Aubrietia deltoidea*.—A. C. 1, *Cerasus pseudo-cerasus fl.-pl.*; 2, *Staphylea colchica*. Both are quite hardy.—T. A. 1, *Fittonia Pearcei*; 2, probably *Crassula jasminea*: send when in flower; 3, *Pilea microphylla* (*muscosa*).—S. Ridley. *Sprekelia formosissima*.—G. F. Apples next week, if it is possible to determine them now; 4, *Pinus excelsa*; 5, *Picea Morinda*; 6, *Cupressus macrocarpa*.—A. B. *Ribes sanguineum*, double rose form; *Primula* var. *Epimedium alpinum*.—W. B. *Pulmonaria officinalis*.—H. P. *Acer platanoides*, the Norway Maple.—W. G. *Pittosporum undulatum*.—W. W. 1, *Fuchsia splendens*; 2, *Oxalis Ortigiesii*.—W. B. *Amelanchier canadensis*.—No name—in wooden box. 1, *Accoanthera spectabilis*; 2 and 3, forms of *Symphytum officinale*.

**NECTARINE:** W. W. The shoots are badly blistered, you should have sprayed them with Bordeaux Mixture some time since. It might be of service now but in any case pick off the leaves and burn them.

**ORANGE:** F. S. M. Cut the fruit down through the middle, and you will see that there are two rows of carpels one above the other. It is not uncommon in Oranges.

**ORCHIDS:** J. O. Probably *Cœlogynes*, but you should send some for our inspection another flowering season. The shrivelling may be due to exhaustion from excessive flowering, or over-dryness, but as you give no information concerning the kind of treatment employed, we cannot say which is the cause.

**PEACH-HOUSE:** *Young Beginner*. Let the trees come on without fire-heat, and do not use the syringe for the present, excepting on days that are warm and sunny; only harm is done by rendering the trees and everything about them moist on cool days—in fact, it is a good way of inducing mildew. Later on, in May and June, you may syringe the trees afternoon and morning. Disbud regularly at short intervals, and keep the border moist.

**PELAGONION LEAVES:** J. C. Try a solution of flowers-of-sulphur and water, in the manner described by Mr. Woodgate in "Hardy Fruit Garden" Calendar, in present issue; or use the Bordeaux Mixture in a rather weaker state than the normal strength. Formula often given in these pages.

**PRIMROSE:** S. C. A very good double ivory-white, of good form and substance.

**ROSE NIPHETOS:** W. R. The petals have retained their original leafy condition; why, we cannot tell you.

**SOIL FOR MELONS:** J. G. The soil being very light and poor, you should add heavy loam and a small quantity of well-rotted farmyard or stable manure to it, well mixing the whole together. If you could put a layer of clay under the hillocks on which the plants will grow, it would do good by retaining moisture about the roots. The soil should be well compacted together when put into the frames. It is useless to use bones in the soil, the plant being too short-lived.

**STREPTOCARPUS:** J. L. Two flowers combined into one.

**VINE LEAVES:** R. W. Specimens of leaves too small for investigation. You should send shoots, and more and larger leaves, as well as the tips of shoots.

**WISTARIA SINENSIS:** Scot. By layering in pots or in the borders. Varieties may be grafted or inarched in stocks of *W. sinensis* so obtained. Sometimes seed of Continental growth of the species can be obtained here.

Mr. ROBERT LINDSAY has retired from the Curatorship of the Royal Botanic Garden, Edinburgh, on March 31; present address, Windsor House, Ferry Road, Edinburgh.

If set across three Columns the lowest charge will be 30s.

Page, 2s; Half Page, £4 10s.; Column, £3.

**GARDENERS AND OTHERS WANTING SITUATIONS.**

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

**POSITION.**—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

**NOTICE TO ADVERTISERS.**—In many instances

Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers,

and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Offices for Advertisements,

41, WELLINGTON STREET, STRAND, W.C.

**SUBSCRIPTIONS.**

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

**ILLUSTRATED CATALOGUE FREE.**

# GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH" ROLLING AND COLLECTING MACHINES FOR 1896.

The Winners of every Highest Prize in all cases of competition, and the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world.  
 HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,  
 HIS ROYAL HIGHNESS THE PRINCE OF WALES,  
 THE KING OF THE BELGIANS.

The Late EMPEROR OF THE FRENCH, The EMPEROR OF RUSSIA,  
 And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others. Upwards of 220,000 of these Machines have been sold since they were first introduced in the year 1856.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given. The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

## SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains, Wheels, and Handles.

- To cut 6 in., can be worked by a Lady ... £1 15 0
- To cut 8 in., do. ... 2 10 0
- To cut 10 in., do. by a strong youth 3 10 0
- To cut 12 in., do. by a man ... 4 10 0
- To cut 14 in., do. ... 5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

Beware of DECEPTIVE IMITATIONS.

## DOUBLE-HANDED LAWN MOWER.

- To cut 16 inches, can be worked by one man on even lawn ... £3 10 0
- To cut 18 inches, do. man and boy ... 7 10 0
- To cut 20 inches, do. do. ... 8 0 0
- To cut 22 inches, can be worked by two men ... £3 10 0
- To cut 24 inches, do. do. ... 9 0 0

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Donkey, Pony, and Horse Machines, including Patent Self-Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Oig Harness.

We have dispensed with the old-fashioned method of side delivery in these machines, so that they are thoroughly up to date.

## DONKEY AND PONY MACHINES.

- To cut 26 inches ... £14 0 0
- To cut 28 inches ... 18 0 0
- To cut 30 inches ... 18 0 0
- Leather Boots for Donkey ... 1 0 0
- Leather Boots for Pony ... 1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

## HORSE MACHINES.

- To cut 30 inches ... £22 0 0
- To cut 36 inches ... 28 0 0
- To cut 42 inches ... 30 0 0
- To cut 48 inches ... 34 0 0
- Leather Boots for Horse ... 1 9 0

## GREEN'S PATENT LAWN TENNIS COURT MARKER (No. 3412).

The Best Marker made.

- 1st size, with 3 wheels, 14s.
- Large size for Clubs and Large Grounds, price 17s.

Small Bag of Marking Composition, 9d.

## Green's Patent New Monarch LIGHT DRAUGHT LAWN MOWER.

It is superior to any Mower of this class yet brought out. Very suitable for Small Lawns and Banks.

- SIZES AND PRICES.
- To Cut ... 6 8 10 12 14 16 inches.
  - Without Grass Box 30s. 35s. 40s. 50s. 60s. 70s. each.
  - Grass Box extra ... 5s. 5s. 5s. 6s. 6d. 6s. 6d. 6s. 6d.
  - If fitted with a Long Handle for cutting banks, &c., 5s. extra.

No charge for packing cases, except for shipment.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.

N.B.—Those who have Lawn Mowers which need repairing should send them either through their Ironmonger or Seedsman to our Leeds or London Establishment, or direct to us, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

GARDEN SEATS AND CHAIRS, AND HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c. Descriptive Illustrated PRICE LISTS Free on application to

**THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON;** or they can also be had of any respectable Ironmonger, Seedsman, Merchand, or Factor in the United Kingdom.

## GREEN'S PATENT Ordinary IRON and WATER-BALLAST ROLLERS

FOR Lawns, Drives, Bowling Greens, Cricket Fields, and Gravel Paths.

PRICES OF HAND ROLLERS.	cwt. qr. lb.	Diam.	Length.	Reduced Prices
PRICES OF	2 1 0	16 in.	by 17 in.	£2 5 0
	3 0 0	20 in.	22 in.	3 0 0
	5 2 0	24 in.	18 in.	4 5 0
	4 2 0	26 in.	23 in.	5 10 0
HAND ROLLERS.	8 2 0	31 in.	32 in.	7 5 0

## GREEN'S IMPROVED WATER & SAND BALLAST ROLLERS. IN TWO PARTS.

They can have the weight regulated to suit the requirements of the ground, and also have it increased up to 45% on the empty weight of the Rollers.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in Great Britain.

PRICES, INCLUDING FUNNEL.	cwt. qr. lb.	Diam.	Length.	Reduced Prices
PRICES, INCLUDING FUNNEL.	2 1 14	18 in.	by 17 in.	£1 0 0
	3 1 0	20 in.	22 in.	4 0 0
	5 2 0	24 in.	26 in.	5 5 0
	6 2 0	28 in.	28 in.	7 0 0
	8 2 0	32 in.	33 in.	9 5 0

These Rollers possess many advantages over all others; they are made in two parts, and are free in revolving on the axle, which affords greater facility for turning, and the outer edges are rounded off or turned inwards, so that the unsightly mark left by other Rollers is avoided. They are manufactured of the best materials, bored true in the lathe, turned on the inner edges, fitted on polished shaft, and are got up in a manner surpassing any hitherto brought out.

## GREEN'S IMPROVED PATENT GRASS EDGE OLLIPER. THE "HANDY."

The work it does is clean, neat, and effective, and we have every confidence in recommending this useful "Handy" implement. It is fitted with long handle, works steadily and with ease.

Price, 30s.

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

### H. Cannell & Son's PRIMULAS, CINERARIAS, and CYCLAMEN.

Never in the history of floriculture has such great beauty of flowers, with so dwarf and robust habit been seen, or plants so near perfection as those recently shown, and for which we were awarded high honours. Our FLORAL GUIDE or PLANT CATALOGUE (post-free) is by far the best book on flowers, beautifully illustrated, and with full particulars. We are gathering new seed, and are anxious to supply from the actual plants exhibited. Every Conservatory must lose considerably in effect without Primula "The Lady," a beautiful new type, forming a pleasing symmetrical pyramid 18 inches high, and charming everyone who enters. Similar extraordinary improvements have been made in our "March Past" Cinerarias and Cyclamen, plants of the latter exhibited bearing 106 finely-developed flowers. Seed 2s. 6d. and 5s. per packet.  
SWANLEY, KENT.

The Sensation of the Century.  
**CROZY'S NEW FRENCH GLADIOLUS-FLOWERED DWARF CANNAS** produce gorgeous masses of brilliant colour, either in the flower garden or conservatory. Strong dry roots of best kinds, Free by Post, 9s., 12s., and 18s. per dozen.—B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, London, N.

**GIANT ASPARAGUS.**—Extra strong transplanted clumps. Low price to clear. Samples free.  
WILL TAYLER, Hampton, Middlesex.

## A BEAUTIFUL DISPLAY of ASTERS can be ensured by sowing

**SUTTON'S SELECTED VARIETIES.**

**THE Gardeners' Chronicle.**

SATURDAY, APRIL 25, 1896.

**FLOWER SHOWS AND THEIR USES.**

A VERY comprehensive term is this in relation to exhibitions of garden produce, and one that, when fully understood, serves to illustrate in a marked degree the far-reaching nature of horticulture. We have our grand shows, such as those in London and other populous cities, which are the fetes of the season. These displays are on a large scale, and attended by thousands of persons. It is a long way from such splendid shows to the village show, held in a small tent or school-room, or sometimes under a rick-cloth fastened over a pole, in some small meadow, the tabling a few rough planks laid on trestles or barrels. Between these widely separated exhibitions there are others; yet it is not improbable that in some of the little villages the humble meadow show excites more interest relatively than does the magnificent exhibition held in some populous centre. Many kinds of flowers have their special set of admirers, and for many of them there are special shows. There is the Rose, queen of summer flowers, a goddess worshipped by her thousands of devotees, and exalted to the skies on show-tables everywhere. There is the Chrysanthemum, whose devotees as queen of autumn far outnumber those of the Rose, and who bring into their fleral worship some of eastern enthusiasm. The modest Auricula, the early-flowering Primula, the Polyanthus, the Tulip, all have their special shows, and new to these have been added the Pansy, the Pink, and the Carnation, whilst later on follows the large and gorgeous Dahlia. Then there are shews of fruit and of vegetables, whilst of shows of a thoroughly miscellaneous character there is legion. Finally, come the innumerable village or cottagers' shows, held in such numbers all over the kingdom, that horticultural life now seems to be almost as much devoted to the exhibition of garden-produce as to its cultivation and production. It may not be out of place to ask whether all seen on the surface in connection with this expanding rage for flower-show competition is the product of love for horticulture, or whether it does not include a grasping after the winnings. Amidst all the anxiety seen to secure prizes in every direction, one exhibition, probably the grandest show of the year in its particular line, we mean that held in the Temple Gardens, has unique associations. There are no prizes offered, unless medals of dubious pecuniary value, but much appreciated as honours, may be so esteemed. The Temple Show has from the first been a remarkable exception to the general rule, and it is hoped it will remain so as long as it endures.

Whilst there is some reason to assume that the desire to obtain prizes in many cases governs the exhibitor more than anything else, there is a good deal of room to fear that some exhibitions are promoted less to encourage horticulture than to make money. That is far from being a desirable feature. Probably, those societies which cater to that end are few, which is all the better. Another evil, undoubtedly more largely existent, is found in the belittling of shows by the breaking up of localities into small show-areas, so that it is found very difficult for executives to honourably pay their way. This undoubtedly evil practice is found most abundantly in cottage-garden shows, where each parish prefers to have its own annual display, perhaps at the best a meagre one, and of quite an unattractive nature, so that few people care to see it. How much better would it be to combine some two or three parishes, secure a good show, make the day a half-holiday in the district, and thus seek to enlarge the show area, and ensure wider support, a worthy display, and a putting aside small parochial jealousies, whilst making an earnest effort to encourage horticulture. Another weak feature found in many, even pretentious shows, is the apathy which the local gardeners generally exhibit towards them. We see year after year the entries few, the classes filled by the same individuals, and in that way competitions become very much restricted and unreal. It may be asked how apathy is produced. Perhaps the show executive does nothing to arouse the neighbourhood to interest itself in the show. Perhaps there is too much of pot-hunting, and when a certain few year after year sweep the board, the rank and file become discouraged. Perhaps no higher aspect of exhibitions enters in the local mind than getting prizes, and ambition seeks no other honours, or will not even try to excel. There is the distrust of the executive, because it has become a small coterie, and dislikes an infusion of new blood; and when this is the case their neighbours lose confidence in them, and the show, as a whole, falls behind the age. These things present some of the demerits associated with horticultural societies and exhibitions. If now and then the work of organising a show is sadly muddled, in the majority of cases the work is well done, and all the arrangements run like clockwork; that is always the case when the work of organisation is in the hands of practical business men. To set against demerits, all of which are capable of easy reform, there are certain undoubted benefits resulting from societies and shows. In every case, large or small as the show may be, first-rate productions—whether in gardens in the bulk or of products individually—are found. These may relatively be few, but there they are, examples that cannot be denied, of what by encouragement it is possible to produce in gardening. It is true the percentage on the whole may be very small, but at least the larger number of indifferent cultivators is shown what is really possible if trial be made, and to what superior heights of excellence they may aspire. A first-class garden, of any size, when seen by others, is an object-lesson whose teachings cannot be denied or decried, and which cannot exist without doing some amount of good. Even pretty flower gardens, or window-boxes in a poor-class district, serve to stimulate emulation. In the same way, the display of the very best samples of garden produce or of cultivation at exhibitions, all prove to be valuable lessons. They help to keep up the average of

garden-culture in a locality to a higher point than otherwise would have been the case.

In the same way, the establishment of so many special societies or exhibitions has done much to stimulate cultivation of the things they particularly encourage. Subtract the weak aspects from the better ones associated with flower shows, and there will still be a large margin of good left.

## NEW OR NOTEWORTHY PLANTS.

### CŒLOGYNE UNIFLORA, Lindl.\*

This is a very fine plant when a large specimen of it is seen. The primrose-coloured flowers rising from the dense tufts of little bulbs and narrow grass-like foliage, have a very picturesque appearance. It is by no means beautiful, but it has assuredly its own peculiar charms, as have many of our plants, the merits of which are not to be measured by square inches. The flowers are nearly of the same colour as our Primroses, with orange-yellow spots on a yellow ground; the size is about the same as that of the well-known *C. fimbriata*, Lindl.

The plant is of special botanical interest. Dr. Lindley described the plant on its earliest introduction in Wallich's Catalogue, and in his *Genera and Species*, under the name of *Cœlogyne uniflora*. Afterwards, in his *Folia Orchidacea*, he formed on this species (and three others) the new genus *Panisea*. The essential point of difference is (according to Dr. Lindley) the sigmoid-flexed claw of the labellum, and I am sure that no such character may be seen in this species, though all others agree in every respect marvellously well with Dr. Lindley's description. As I have had the opportunity of examining fresh materials, I could prove that this plant is a true *Cœlogyne* of the *Prolifera* group. I refrain to-day from pointing out all the pros and cons of this very intricate question; but I will conclude by saying, that I will never consent to the division of a genus into two by such a trifling characteristic as the structure of the claw of the lip. I have not had the opportunity of examining *Panisea parviflora*, Lindl., *P. reflexa*, Lindl., and *P. bilamellata*, Lindl. (all formerly included with *Cœlogyne*); but if I may judge from the results I have obtained by examining this so-called *Panisea uniflora*, I believe it is better to abolish this scarcely-defined genus *Panisea*, and to revert to Lindley's first opinion.

It is surely somewhat astonishing to have to defend Lindley *versus* Lindley, but I cannot help it. There were three eras in Lindley's life: in the first he was under the influence of R. Brown and Olaf Swartz; in the second he was John Lindley, the author of the *Genera and Species*, the acknowledged head of Orchidology and English botany; in the third the rising star of Reichenbach disturbed his circles, and his publications (the *Folia Orchidacea*, for instance), were no longer the result of ripened and elaborate studies, but were the not always successful efforts to defend his superiority against a scholar, who was to disappoint the hopes of his very numerous English friends, not only in this way, but many years afterwards in a far more radical manner. Under this influence, Lindley unfortunately relinquished his sagacious method of showing Orchids, as Orchids must be shown, and he

*Cœlogyne uniflora*, Lindl.—(*Prolifera*). Bulbus aggregatus fusiformibus corrugatis nitidis 2 cm. altis,  $\frac{3}{4}$ —1 cm. diam. diphyllis, foliis linearibus v. lin-lanceolatis 15 cm. longis, 5—8 mm. latis; scapis 1-floris (an semper?); pedicello brevi inter folia 2-juniora oriente; bractea ovata acuminata paleacea carinata acuta pedicellum nec non ovarium hexapterum aequans. Sepalis ovatis acuminatis ringentibus 1.5 cm. longis, ipsis et petalis æquilongis angustioribus pallide luteis; labelli æquilongi brevi-unguiculati (unge non sigmoideo) lobis lateralibus minutis antorsis oblongis acutis, intermedio multo majore cuneato obovato obtuso antice emarginato; callis 2 elevatulis antice in tuberculis planis exsertibus, in disco addito callo tertio brevi didymo in medio; toto labello intense luteo (primulino) punctis 3 in ipsa basi et callis aurantiacis; gynoestemio  $\frac{1}{2}$  labelli æquante utriusque supra medium obtusangulo, postandroclinium crenulato, ceterum omnino generis. Patria? Accepi a donna Ida Brandt, Toricensi. Ex Anglia importata? F. Kranlin.

endeavoured to see with his younger follower's eyes; as it was not in his line to be a morphologist, all his efforts to walk in this way were more or less lost. He is not to be congratulated in having separated *Panisea* from *Cœlogyne*, and in this case, as in many others, his first opinion was the more correct one. The specimen was sent by Mrs. Ida Brandt of Zürich, Switzerland, who obtained it two years ago from M. Kienast Zölly. The country from which the plant was imported is not positively known. F. Kranlin.

## SPRING BEDDING IN REGENT'S PARK.

THE method of garden adornment peculiar to spring is carried out here on a larger scale than is attempted in the other parks, and a week ago the beds presented an excellent picture of floral beauty. Mr. C. Jordan has taken advantage of the favourable site for such a display afforded by the avenues of Elms and Chestnuts. The system of raising portions of many of the beds to give way outlines is an admirable one, as by its means it is possible to avoid straight, formally planted, flat surfaces. To refer to some of the beds which were particularly good at the time of my visit, I may mention *Narcissus Empress* and *Hyacinth King of the Blues*, planted alternately, and margined with *White Arabis*. This was effective, but a lighter coloured *Hyacinth* would have been prettier. A very imposing bed is that planted with *Narcissus Emperor*, some 1200 bulbs, clumps of dark *Wallflowers*, a mixed band of golden-leaved *Valerian*, *Valeriana Phu aurea*, and *Tulip Couleur de Cardinal*, in a setting of *Saxifraga Camposii*, and a margin of *London Pride*; *N. Empress*, with ground of semi-double mauve *Primrose*, *Arthur de Moulin*, pink *Saxifraga globosa*, with edging of *S. geranioides*. A very pretty bed is that of *N. Horsfieldi* and *Muscari* or *Grape Hyacinth*. That bold-looking *Narcissus*, *Sir Watkin*, is admirably associated with alpine *Auriculas*.

*Polyanthuses* and *Primroses*, in light shades of colour, produce a pretty effect. The *Hyacinths* are furnished with good spikes of flowers, and the colours are tastefully blended. A fine bed is that of *gigantea*, pale pink, and *Czar Peter*, porcelain-blue, as is another one planted with *Charles Dickens* and *Czar Peter*. An arrangement of *Hyacinth King of the Blues* on *Arabis albid*, interspersed with *Polyanthus-Narcissus Grand Monarque*, white, with citron cup, is very effective. The *Hyacinth*, *Gertrude*, a fine dark red, producing a splendid truss, is capital.

*Tulips*, as usual, are the most showy. What a magnificent effect is produced by 3000 bulbs of *Keizer Kroon*, bright red, edged yellow, and margined with three rows of *La Belle Alliance*, a beautiful bright crimson. A similar-sized bed is composed of *Proserpine*, rose, with a margin of *Rose Grise de Lin*, pink. Another effective bed is that of *Joost Van Vondel*, glossy red and white, and extra large flowers. It appears in a groundwork of mossy *Saxifraga*. Amongst the late beds of *Tulips* are the highly effective *Gesneriana*, *Blue Celeste*, *Bouton d'Or*, and *Macropsella*.

The borders present quite a glow of admirably varied colour. A very effective mixture was noted in pink and white *Hyacinths*, alternate with *Tulip Proserpine*, deep rose; *Dielytra spectabilis*, alternate with *Golden Valerian*, *Spanish Iris* alternate with *English Iris* to follow, with yellow and violet *Violas*, the whole edged with *White Arabis*. *Hyacinths* mixed in red, white, and blue varieties, with the showy *Doronicum plantagineum excelsum*, were tasteful, as was also a mass of *King of the Blues* and *Madame Van der Hoop Hyacinths*, with a groundwork of *Viola Bullock* (yellow). An association of *Narcissus Orange Phoenix*, between light shades of blue and pink *Hyacinths*, with alpine *Auriculas* for groundwork and margins, is well worthy of mention.

*Hyacinth Grandeur* a Merveille, creamy-white, fine in spike, in a setting of scarlet *Tulips*, was an effective picture. Masses of dark *Wallflowers* presented good effects. A late border, of which much is expected, is composed of clumps of *Polyanthus-Nar*

cissus Grand Monarque, a ground of cinnamon tufts of *Primula cortusoides* Sieboldi, *Viola Sylvia* is planted between Narcissus, the edging being *Arabis albida*. *Anemone coronaria* and *Hyacinth Madame Van der Hoop* formed as effective a bed as any.

In the grass, generally on the higher ground, there are colonies of Daffodils, Tulips, &c., which under the trees have a very picturesque effect. Although it does not form part of our subject, note may be made

other old and still leading species owe their preservation to the care taken of them at Westonbirt. From these plants many fine crosses were obtained, with *H. solandraeflorum*, *H. psittacinum*, *H. marginatum*, and *H. m. conspicuum*, and the varieties of *H. vittatum*, and a thoroughly distinct race of finely-formed brilliant flowers, borne on four to six-flowered umbels, and of which *H. Holfordi* is a good example, was the result. To this strain Captain Hol-

pure white raised here, to the deepest blood red, the latter having in many cases a very dark maroon sheen in the centre, which is peculiar to the dark type here. The side staging also has a number in bloom, and with them a batch of seed-bearers to produce further advances, but nothing is attempted in that way but in pursuance of a system, unless in a few cases where some wide crosses are tried on the chance of good results.

The Westonbirt strain *par excellence* is coloured a brilliant scarlet, having a white star-like patch in centre, and frequently with one broad white band up the middle of each segment. Of these, Glow-worm and Fireman are capital examples. Lady Bathurst is rich dark scarlet, with darker veining; the Sultan, blood-red, and Holfordi still among the best. Among so many new varieties it is pleasant to remark old favourites as *H. marginatum*, *H. m. venustum*, and *H. m. conspicuum*, kept pure, for in their even marking of pure white and scarlet they are not yet surpassed in their class.

The zonal *Pelargoniums* also make a grand show, and the house is as full of brilliant colour as that of the *Hippeastrums*. In raising seedlings, Mr. Chapman has accomplished something out of the ordinary range, his delicate pure pink *Lilian* being unapproached for size of truss and fine form; and others also are very good. A fine show of *Azalea indica*, *Cinerarias*, &c., was remarked in the other greenhouses; and a proof of the mildness of the last winter was seen in self-sown *Cinerarias* in good health outside quite without protection. The *Camellias* in their house afford a great show of flower, as do the climbing plants overhead. In the tropical-house were observed *Heliconia bicolor* in bloom, and on the roof, which it partially covers, *Ipomoea rubro-cerulea* with numerous flowers. At some seasons over 1000 blooms may be counted open at one time on this charming blue-flowered plant, and few things can compare with it when so well grown as here.

INTERDEPENDENCE OF PLANTS AND ANIMALS.

(Continued from p. 433.)

It is hardly necessary to say much of the handsome flowers that bask in the sun, and derive their glowing colours from his rays. We may, however, mention those which open early in the morning, and close before the light becomes too strong for their delicate complexions. Perhaps the best-known example is the *Morning Glory*; but other *Convolvulaceae*, *Orchids*, and *Bigonias*, are equally striking. Then, again, there are species which cannot bear the least dampness, but wait until the sun is well up before they open, and close again as the shadows lengthen, or earlier in cloudy weather. Another class open toward nightfall—but these approach that very large division which is nocturnal in its habits.

What a glorious assemblage are the night-bloomers! The *Victoria Regia*, the *Cereus*, and other *Cacti*, the *Daturas*, with a host of other white flowers, all open at sunset, distil their perfumes, and diffuse them through the damp air. Then come those other white flowers, which remain open during the day, but continue almost, or quite, scentless until recovered from the effects of the burning sun at nightfall. In the forest many trees bear insignificant-looking greenish-white flowers, hardly worth looking at. But, paddle along near the bank of the river at night, and you will be astonished at the different perfumes wafted from these poor little blossoms. Now it is an odour of the *Jasmine* type, so strong as to be quite sickly; and anon one of those half-aromatic scents which almost exhilarates. Where they come from, or to what tree they belong, it is impossible to say—perhaps they are being distilled by a tree close to the bank, or it may be by one of which we know nothing, a quarter of a mile away.

Perhaps the most interesting point in connection with these perfumes is, that they are distilled at certain times, and then only for short periods. Sometimes the flower opens, carries on its work for an hour or two, and then closes, either altogether, or in

FIG. 79.—PEONIUS PSEUDO-CERASUS, NEW VARIETY.

(Exhibited before the Royal Horticultural Society on April 7 (see p. 466, col. 3). The flowers are semi-double, white, with green shade; centre of flower, pale rose tint.)

of the fact that it is intended this season to plant a dell in the park with the graceful forms of Bamboos, adaptable for this purpose. J. B.

WESTONBIRT.

(Continued from p. 484.)

The *Hippeastrums* always have been a special feature at Westonbirt. There all the earlier introductions mentioned in Sweet's *British Flower Garden* found a home, and it is probable that the true strain of *H. Ackermanni* and *H. A. pulcherrimum*, and some

ford, who takes a keen personal interest in the matter, has introduced *H. Empress of India*, and a few other of Messrs. Veitch's robust crosses which bear the desired number of flowers on a spike, and the result has been to still greatly improve the Westonbirt strain without destroying its characteristic features. Probably in no other private garden has there been such a brilliant display of gorgeous colour in *Amaryllis* as that which Mr. Chapman has for some time past had in the large span-roofed *Hippeastrum*-house where the whole of the centre bed is filled from end to end with fine flowers, varying from clear

a few cases, to repeat the process at the same hour next day. These latter are, however, the exceptions; as a rule the flowers remain open, but apparently quiescent, until the time comes round to resume work. This is beautifully exemplified in certain Orchids, and sometimes causes great disappointment to their owners. Perhaps you have been telling a friend of the delicious perfume of Burlingtonia fragrans, that it brought to your memory a pretty lane in the old country, where as a child you used to go and smell out the sweet Violets when they were so hidden among the leaves that you could hardly find them otherwise. "Come along!" you say, and take him to the flower. "Is it not delicious? Does it not bring up the old memories? What a close resemblance!" Your enthusiasm carries you away, and you expect an eager response. But no, not a word does he say, although his politeness prevents him from contradicting you. The fact is, the flower has already done its work for the day, and not the slightest trace of perfume lingers on its beautiful petals.

This is by no means uncommon; in fact, intermittent distillation is almost general in the white flowers of the tropics. Even in temperate climates there is a striking difference between the perfume given out at different times, but rarely are the flowers quite scentless at any time. It might be thought at first that these alterations were erratic; but close observation shows that they are nearly true to the minute, and, if carefully timed, would almost certainly be found to coincide with the period when the fertilising agent is on the wing. For this is the simple explanation: the flower can only be fertilised by a particular kind of insect, and all its efforts are put forth when that insect is likely to be hovering around. Without the flowers the bee could not exist, and without the bee no seed would be produced. That this interdependence is complete can be easily proved in our gardens, as indeed it is also patent to everyone who has a conservatory in other countries. Without some particular insect the plant flowers over and over again without producing a single perfect seed, and as this agent does not exist away from its native habitat, the plant remains barren.

That there should be such a nice arrangement appears more than mere coincidence, and even shows design in the plant rather than the animal. We may perhaps say that the insect fixes its dinner-hour at the time when its food is ready; but in the case of many perfect insects, their life is so short that preparation would have to be made in the pupal stage. It is therefore easier to suppose that the first choice was made by the plant. The interdependence is, however, so very close that it is just as hard to decide in favour of one as of the other.

The shapes of flowers, like their perfumes and colours, also show wonderful adaptations of means to a particular end. The great tubular flowers are just deep enough to allow the long proboscis of the humble bee or moth to explore their depths.

Again, we are met with the question, was the contrivance of the flower or the bee adopted first? We can conceive that in some past age this deep funnel was but shallow; probably made up of fine separate petals, and as wide open as a Buttercup. Bees kept up a continual irritation in their search for nectar, and caused the sensitive stigma to recoil, as it were, and bring its petals closer together. Only the bees with the longest proboscis could now reach the reservoir, but there were still enough of these to keep up the irritation. As generation after generation passed, the deepening and elongation still continued, until now we have flowers with tubes 6 inches or more in depth, and humble bees, the proboscis of which are able to sip nectar from the very deepest, at the same time performing the necessary work of fertilisation.

A great deal more might be said of flowers, but we are unable to deal with other than a few of their contrivances, and must proceed to the fruit. Here also the interdependence of plants and animals is beautifully exemplified. But, instead of insects, we now have to deal with birds, bats, rodents, monkeys, and even fishes.

The fruits of the tropics have succeeded in protecting themselves against insects, and are consequently never subject to the attacks of wasps like their consins of more temperate climes. It is true that beetles make sad havoc among them, but otherwise their thick skins are impenetrable to anything smaller than birds or bats. The Orange family seems to have even gone further, and by means of bitter secretions and stinging essential oils kept off all comers. Other fruits have not gone so far, although many of them try their best, with thick skins impregnated with tannin, and in some cases poisonous milky juices, to preserve their edible seeds from destruction. Few, however, succeed in this—the animals have learnt to peel them and get their share.

On the other hand, a large class of fruits is obviously intended to attract. It is not to the advantage of a tree that its seed shall lie round the trunk and be lost in the struggle for existence. It has therefore followed that efforts have been made to provide something to feed the animals, but at the same time to protect the life-germ from extinction. This is often done by covering the seed with a hard shell, outside of which comes the luscious pulp which forms the attraction. Birds sometimes carry food to long distances, to eat at leisure or to feed the young, and thus the seeds are dispersed in every direction. Sometimes they are eaten and ejected without injury; in fact, rather with benefit as far as can be judged—most of the Figs and Loranthus are examples of this. Where there are bats their lurking places are often strewn with fruit, more or less disfigured on the outside, but really never injured as far as the germinating power is concerned. These little creatures hang in large numbers about the festoons of creepers which border the creeks, or inside hollow trees, and do a great deal towards dispersing the seeds by bringing them within reach of the flood. As nearly all of them float, they are carried down the stream and scattered in a thousand places which otherwise they could never reach, even finding their way to the shores of Africa, Portugal, and England.

Without the flowers and fruit the forest would be entirely deprived of animal life, and in the absence of the clouds of insects not a seed could be perfected. The interdependence is so close that they appear as if striving with each other to see which can get ahead. Trees secrete poisonous juices to keep off larvae, but the caterpillars do not mind that. They only develop a greater power of digestion and assimilation, so as to be able to thrive on the poison. However dry and harsh, thick and leathery, hairy, scaly or bristly, the leaves may be, some insect can be found capable of devouring them without injury to itself. It would never do for a plant to lay itself open altogether to their attacks, as then its extinction would be certain, therefore it tries its best to ward them off. Those which do not put on armour, generally protect themselves by acrid, bitter, and poisonous secretions. No doubt they succeed to a certain extent, but it always happens that some of their foes still get the better of them. *J. Rodway, in "The Guiana Forest."*

## ORCHID NOTES AND GLEANINGS.

### ABNORMAL CYPRIPIEDUM HIRSUTISSIMUM.

I SEND you an interesting example of *Cypripedium hirsutissimum*, where the pouch of the lip in the course of growth divides itself into two fairly well-formed slippers. It is from the collection of Richard Ashworth, Esq., Ashlands, Newchurch, Mid-Lancashire. The flower is not so large as many I have seen, but it is compact and normal in all its parts, barring the labellum. The dorsal sepal is blackish-brown, clouded, merging into a yellowish-green margin; the inferior sepal, in which the pouch rests, is of similar colour. The petaliferous limbs, towards the base and for half their length, are bright yellowish-green with minute blackish-brown spots, which go well with the gaufered edging of the top outline; the extremity of the petaliferous limbs are of beautiful shining heliotrope; the pouch

is of similar colour and shading to the dorsal sepal; the staminode is very prominent as in all *Cypripedes*, although in no way abnormal. The foot-stalk of the flower with the prominent swelling ovary is corrugated and bristling with hairs. *J. A.*

### M. PYNÆERT VAN GEERT'S ORCHIDS.

M. Ed. Pynaert van Geert has now in bloom a splendid *Cypripedium Rothschildianum*, a hybrid between *Stoneii* × *Spicerianum*, with three very dark flowers, the standard and lower sepal delicate rose; also *Lycaste Skinneri*, pure white, with a very dark lip; *L. S. delicatissima*; another variety, with lilac, purple-veined sepals, the petals and lip very dark; *Odontoglossum nebulosum*, a splendid large-flowered variety; several fine *Anacochilus*; *Dieffenbachia Fernieri*, one of the sturdiest species known; *Liparis elegantissima*, with a peculiar metallic sheen; and *Draconia Desmetiana*. *D. B.*

## THE FRUIT CROP OF 1895.

The fruit crop of 1895 was unusually abundant in respect of some kinds of fruit, and upon the whole it may be said to have been of excellent quality. The heat and drought appeared to suit Plums fairly well, and Damsons and Apples extremely well, although rather too intense for the later Strawberries and for Raspberries (the yield of which was not very large by reason of the dry weather), Red Currants, and Black Currants on some soils. Pears, as a rule, were not a good crop. The unusually hot weather in March forced out the blossoms, which were nipped by the frosts and cold wind in April.

Gooseberries were generally plentiful, but the quantity of Red Currants was not nearly so great as in 1894, when the bushes were literally covered with fruit. Black Currants were not more than an average crop, except on the best soils.

Throughout Kent, the premier Cherry county, and in other places where Cherries are grown, the crop was large and of first-rate flavour. It was thought that the very dry weather in May and June would make the Cherries fall before they ripened, but comparatively few did so, and the heat of the sun gave them unusual quality and size.

In the famous orchards of East Kent, the Cherry trees were perfect pictures during the time of blossom in May, as well as in the summer, when they were literally covered with red and white clusters of fruit.

Plums, though plentiful in places, were not generally a full yield. Some varieties were short in parts of Kent, Cambridge, and other counties; but in Worcestershire, especially in the famous Evesham district, there was a very large crop of most varieties, notably of Rivers' Prolific, early and late Orleans, Czars, and Victorias.

Damsons were abundant in quantity throughout the country, and many thousand bushels did not pay the expenses of picking, carriage, and commission, while some were not picked at all.

The produce of Cob-nut and Filbert trees was so large in 1894, that it was considered probable there would be a great falling-off in 1895, as the trees would be materially weakened; but in spite of this, their yield was more than an average amount.

In every part of the country, and, it may be said, in every orchard and garden, there was an abundance of Apples of all varieties. Growers had great difficulty in disposing of much of the fruit at prices that gave any profit, especially the early sorts, which do not keep, and later sorts of common quality. Thousands of bushels were not picked, but knocked off the trees with sticks, and packed in sacks for smashing, cider-making, and other uses, at ridiculously cheap prices.

Strawberries sold well at rates ranging between 2d. and 6d. per lb., and Cherries made capital prices at from 3s. 6d. to 7s. 6d. per 24 lb. They began at the lower rate, but very soon improved in price, as it was seen that the imports of foreign Cherries were much less than usual, and the hot weather was favourable for their consumption. The importation of Cherries during May, June, and July, 1895, amounted to 193,499 bushels, against 310,263 bushels and 341,527 bushels, respectively, in the corresponding months of 1894 and 1893.

Gooseberries sold at from 1s. 3d. to 4s. per half-sieve of 28 lb. A good many were sold at rates which left but small profit to the producer. Red Currants brought from 1s. 6d. to 4s. 3d. per 24 lb., and Black Currants sold better at from 3s. 3d. to 7s. per 24 lb.

Foreign competition does not interfere much with Raspberries, for which there is always a strong demand for jams, jellies, and culinary purposes. This fruit, of which there was only an average crop, made good prices—from 25s. to 40s. per cwt. Fine Raspberries, packed in punnets for dessert, brought 6d. per lb. without much trouble.

Plums had a wide range of values. Some early sorts made specially good prices because of the smaller imports from abroad, particularly in the first part of the season. For instance, in July, 1895, the importation of Plums was only 59,040 bushels, compared with 165,134 bushels and 355,725 bushels respectively in July, 1894 and 1893. The total importation of Plums during 1895 only amounted to 401,080 bushels, contrasted with 777,411 bushels and 777,142 bushels respectively in 1894 and 1893.

Prices for Plums varied between 2s. 6d. to 7s. per 28 lb., the mean price being about 3s. 9d. per 28 lb.

Prices for Damsons were between 1s. and 3s. per 28 lb., and much of this fruit was sold at a loss. Picking, railway rates, tolls, and commission more than balanced the prices made for many consignments, though Damsons were retained in very many towns at the rate of 3s. 6d. to 6s. per 28 lb.

Equally unsatisfactory prices prevailed for Apples. Early sorts, such as Lord Suffield, Keswick Codlin, and others that do not keep, made only from 1s. to 2s. 3d. per sieve or bushel, or from 42 lb. to 46 lb. Many of these Apples were wasted. Prices for Apples during the season ranged from 1s. to 5s. per sieve or bushel; only fine dessert Apples making the latter price. Exceptionally choice Cox's Orange Pippins, Margils, Ribstons, and other famed varieties, made a shilling or two more per sieve. It was rather the heavy crop at home, and not the importation of Apples from abroad, that made prices so very low, for it will be seen from the Trade Returns that the quantity of Apples imported in 1895 was 3,292,562 bushels, while, in 1894, 4,968,669 bushels were imported, and 3,459,984 bushels in 1893. It may be that the reports of the heavy British crop prevented importation to some extent.

Pears, being scarce, made high prices—from 6s. to 16s. per sieve or bushel, and even more for very fine specimens. This fruit was also scarce throughout all the Pear-exporting countries, as only 407,146 bushels were imported into the United Kingdom in 1895, against 1,310,074 bushels in 1894, and 915,212 bushels in 1893.

Cob-nuts and Filberts sold well at between 3½d. and 5d. per lb., giving a good profit to growers, and compensating them somewhat for the bad prices of 1893 and 1894. Taking the plantations throughout, the crop is estimated to have averaged between 7 and 8 cwt. per acre.

On the whole, the past season would appear to have been a profitable one for fruit-growers, at all events for those who grow various kinds of fruit.

The question of a more economical method of distribution of home-grown fruit is now receiving a good deal of attention. To get the full advantage of reduced railway rates, growers will probably find it necessary to alter the shape of their fruit packages so as to economise space. The round sieves and half sieves, though admirable in other respects, take up unnecessary room. Foreign fruit packages are, for the most part, square or oblong baskets and boxes, which fit into corners; and these packages go, in most cases, direct to the retailers, all the fruit being graded, sorted, and packed so that it can be depended upon by purchasers. British fruit consigned to markets also reaches the retailers in its original package, which is charged for if not returned, and it would be well if at least the best fruit, or even some of it, were graded, sorted, and placed in special packages, not returnable, in quantities to suit the convenience of customers.

The sieves, or their square or oblong substitutes, required by the railway companies, would be used for the main consignments as at the present time. *Journal of the Board of Agriculture.*

## TREES AND SHRUBS.

### RHODODENDRON LUSCOMBEI ×.

THERE is a section of *Rhododendron* (to which *R. Aucklandi*, *R. Thomsoni*, and several others belong) which is distinguished by the few-flowered lax inflorescence, and by larger, shallower flowers than are characteristic of such species as *R. arboreum*, *R. catawbiense*, &c. This section is but poorly represented among the hardy species, but is being gradually enriched by hybrids, of which *R. Luscombei* is one of the most beautiful. It was raised by Mr. Luscombe about 1880, its parents being *R. Thomsoni* and *R. Fortunei*. There are two specimens in flower in the open at Kew, one of which is 7 feet high, and as much in diameter, every branch bearing a truss of from eight to twelve flowers. Each blossom is 3½ to 4 inches across, and is of a lovely shade of soft, rich rose, with cinnamon-coloured spots near the base. The leaves are oblong, and from 3 to 5 inches long, bright green above, paler beneath, and smooth on both surfaces. This hybrid is perfectly hardy at Kew, and its distinctness and beauty render it a valuable acquisition to the early-flowering group of *Rhododendrons*.

### BERBERIS BUXIFOLIA (SYN. B. DULCIS).

This is one of the earliest of all the Barberries to come into flower, and although not so showy as either *B. Darwini* or *B. stenophylla* ×, is a charming and useful shrub. A large bush at Kew about 8 feet high has for some weeks past been covered with blossoms. The leaves are small, and are produced in tufts along the branches, each tuft being armed with spines. The flower is of a clear, bright-yellow colour, and larger than that of most Barberries. It is borne singly on a slender, drooping stalk, which

springs from the axil of the leaf. This evergreen species is a native of Chili, and is said also to come from the Magellan Straits region. It was introduced about 1830. Propagation can be easily effected by seeds, which it ripens freely in this country.

### RHODODENDRON NIVEUM.

Although this is far from being the showiest of the Himalayan *Rhododendrons*, it is worthy of notice as being one of the few that are really hardy in the London district. Two or three bushes, 4 to 5 feet high, are in flower in the *Rhododendron* dell at Kew, some of which were unprotected many years ago. The lanceolate leaves are 4 to 6 inches long, and at this season are dark glossy green above, but covered beneath with a pale brown felt. When young both surfaces are clothed with this felt-like substance, which is then almost pure white, but it afterwards disappears from the upper side. The flowers are closely packed in rounded compact trusses that measure 4 inches across. The corolla is bell-

FIG. 80.—*JUNIPERUS DRUPACEA*.

shaped, 1½ inches in diameter, and of a clear, unspotted, purplish-lilac colour. The species is one of Sir Joseph Hooker's introductions from Sikkim. *H. J. B.*

### THE SYRIAN JUNIPER (*JUNIPERUS DRUPACEA*).

In several respects this species must be considered as one of the most interesting of the Junipers. It is of bold, upright growth, with a well-formed tree-like stem, and produces large Plum-like fruit, quite distinct from any other of the family. The Syrian Juniper (fig. 80) is often said to grow very slowly, and to be small, but in this country at least this is not the case; for a specimen that has long been under my observation has, in thirty years, attained to a height of 21 feet, the stem girthing 25 inches at one yard from the ground. No doubt this particular specimen is growing in a moderately sheltered situation, and in a strong, rather unctuous clayey loam. Perhaps the worst fault of this species of Juniper is the early loss of the lower branches after a height of 12 feet or thereabouts is reached, and this loss of branches is general, and it was noticeable in every specimen that I know of. In general, the habit of the Syrian Juniper is upright, not stiffly so, but just sufficient to impart a neat appearance to the tree. The branches incline upwards, and the branchlets slightly droop; the foliage is thickly produced—crowded, in fact. The leaves vary much in length, according to their position, but they are, for the

greater part, three-quarters of an inch long, stiff, sharp-pointed, and of an uniform grey-green colour, and quite wanting in the various tints of silver or frosted appearance possessed by many species of Juniper. The fruits are sparingly produced even on old specimens; but when in any quantity, the tree has a beautiful appearance from contrast between the large blue-black berries and the light green foliage. The fruits are almost spherical, except at the apex, which is deeply cleft or indented, are fully three-quarters of an inch in diameter, and often become suffused with a glaucous bloom just before they ripen.

For ornamental purposes, in sheltered spots, and in stiff soils, I would recommend *Juniperus drupacea* to be planted, as being a tree of robust and stately growth. *A. D. Webster.*

### EARLY-FLOWERING SHRUBS AT FINNIART, N.B.

The flowering of *Magnolia conspicua* has been referred to by your correspondents in various parts of the country south of the Tweed; and I would mention that there is at present a plant flowering most profusely on the south wall of Colonel Marryatt's house, Finniart, Loch Long, N.B. The plant is nearly 30 feet high—in fact, almost covering one end of the house; and hard by, on the porch, a double red-flowered *Camellia* is carrying at least one thousand buds and blooms. On the west front *Berberis Darwini*, 15 feet high, is clothed with its golden-yellow flowers. The white *Camellia* is scarcely as profuse in its flowering as the red, not being as favourably situated; *Pyrus japonica* was very pretty too—in fact, the house is literally covered with flowering shrubs and climbers. These consist, besides those named, of white and yellow *Jasmine*, *Roses*, and *Clematis*, vieing with each other in making the place attractive, being a source of delight to the residents of Finniart. Many of the *Rhododendrons* at the time of my visit were and had been in bloom for a long time. Hardy *Azaleas* are splendidly set, and will be fine later on. Few persons who have not visited the district have any idea how luxuriantly these subjects grow in this sheltered spot so far north. *Tropæolum speciosum* has been green all the winter, and last season's *Calceolarias* are still to be found in the borders. *Desfontainia spinosa* grows and flowers freely on a wall in the district; and *Escallonia macrantha* is equally at home.

The houses at Finniart were gay with several good varieties of *Cattleya Mendelii*, one, in particular, a dark variety, I noted in the stove. Orchids are not a specialty here, although several species are represented, and all equally well grown. Mr. Peters, the gardener, prides himself on his success with the *Souvenir de la Malmaison* varieties of *Carnation*, Mr. Marryatt's favourite flower, and which he cultivates by the hundred. I saw no sign of the dreaded *Carnation* diseases, and the various batches of plants were all equally healthy and vigorous. Two fine plants of greenhouse *Rhododendrons* were nearly past; zonal *Pelargoniums* are very fine; and *Cyclamens* particularly good. Another plant too seldom seen in gardens, *Streptosolen Jamesoni*, formed a very pretty object; and a fine batch of herbaceous *Calceolarias* in one of the houses will help to make a fine show very shortly, besides numerous other subjects coming on. *Anglo-Scot.*

### EARLY VEGETATION IN THE SOUTH OF SCOTLAND.

The Rev. David R. Williamson, the publication of whose letter has been deferred, writes from Kirkmaiden Mause, Wigtonshire:—"Trees in this parish have at present the appearance they presented last year in the beginning of May. This statement is especially expressive of the *Sycamores* and *Chestnuts*, which in many places are already exhibiting their virginal leaves.

Beneath sheltering hedges of Hawthorn I have found—*mirabile dictu!*—the pink *Campion* in bloom. The *Periwinkle* is unfolding its luminous blossoms, white and blue. I have not yet observed the tender flowers of the *Wood Sorrel* (*Oxalis Acetosella*), but I anticipate that, under the influence of the all-penetrating sunlight that prevails, it will ere long appear.

A Fig-tree in Logan Gardens, a few miles from this Manse, has fruit not only formed, but considerably grown; it is growing on a warm, greatly sheltered south wall.

In my own garden, which enjoys perfect immunity from withering winds, the Almond-tree, which I have never seen flowering elsewhere in Scotland, is in exquisite bloom. So also are the Czar and Early Rivers Plums, the Pitmaston Duchess and Doyenné du Comice Pears, the Black Eagle and May Duke Cherries, and Denniston's Superb Green Gage. The Duchess of Oldenburg, Irish Peach, and Beauty of Bath Apples are not far behind these, and are rapidly preparing to follow in their train.

*Narcissus poeticus*, Queen of Spain, (*Narcissus Johnstoni*), and *Narcissus albicans*, the supremely beautiful Spanish Daffodil, silvery-white in colour, but suffused with pale lemon in its primary stages of development, have been in flower for nearly a week, though the Poetic *Narcissus* usually flowers here in the beginning of May. For *Narcissus albicans* (*moschatus*), I must express my acknowledgments to Mr. F. W. Burbidge, of Trinity College Gardens, Dublin, who sent me this impressive variety in December last, with the assurance that I would be delighted with its beauty when April came. His prediction in both cases has been fulfilled; for it has come with the—

"Sweet, uncertain weather,  
When gloom and glory meet together;"

and I find it as beautiful as the bright anticipations which were inspired by his words.

Almost equally artistic in aspect is its primrose-hued companion, the charming Queen of Spain. Somewhat later than this graceful Daffodil, but not less appreciated, are *N. Barrii conspicuus*, and *N. Burbidgei*, of which the former, raised by Mr. Barr, of Covent Garden, is the most pre-eminently attractive of all hybrid *Narcissi*. To the lover of this fragrant family of vernal flowers its first appearance is a veritable revelation.

## THE ASHLANDS, NEWCHURCH.

Among the many charming sights along the crest of the hills rising on each side of the Rossendale valley is The Ashlands, the residence of Richard Ashcroft, Esq., a gentleman who takes great pleasure in gardening pursuits. All along these valleys of Mid-Lancashire there are many business men who are enthusiastically attached to gardening. Beginning with border flowers, shrubs and trees, and modern parterre gardening, many—indeed, most of them—have built sets of greenhouses, and from *Pelargoniums*, *Cinerarias*, *Fuchsias*, *Camellias*, and *Azaleas*, the bent of the inclination has turned to Orchids. So has it been with Mr. Ashcroft, who has a capacious mansion, surrounded by—first, the grass parterres, then by borders of the waving outline common to most villa residences, and guarded by a fringe of evergreen shrubs, and then of deciduous trees, which at one time must have been a portion of a wooded glade, now transformed into tenements for the housing of the workmen employed in those busy hives of industry round about Newchurch and Waterfoot. The site of the residence is 760 feet above sea-level, and commands a wide view of pastoral and woodland scenery, with multitudinous chimneys of factories, &c.

There are, in three different ranges of greenhouses an ornamental range of considerable extent, in which a domed conservatory forms the centre; a subsidiary range, in which cool Orchids find a home, attached to a potting-shed; and one of span-roofed houses, in which flowering Orchids in the one compartment, and the *Cattleya* family chiefly in the other, fill the whole space.

The conservatory, which is entered from a walk which is bounded by a very handsome stone balustrade, is very gay with *Azaleas* of many varieties, *Camellias*, a gay lot of *Cinerarias*, and flowering plants suitable for cutting. The adjoining division is a vinery, but judging by the number of Orchids standing about and suspended, it will in time be

otherwise utilised. Adjoining these, again, is a houseful of Tea Roses, than which none was more beautiful in bud or more telling in colour than the red *Gloire de Dijon*, or *Reine Marie Henriette*. In the house in the other wing of the conservatory is the general collection of *Dendrobiums*, comprising some of our finest species, and also some of our finest crosses. No variety seems to be more popular at the present time than the pure white *D. nobile*, which goes under the name of *Amesiae*, and undoubtedly it is a beauty differing in some varieties as to breadth of segments and purity of colour. Here half-a-dozen suspended plants are going along well, and there are a great many of the best of the importations of the *D. nobile* section, which still holds front rank. Among the best crosses I have seen this season, is *D. × splendidissimum illustre*, quite a red *splendidissimum* when at the earlier stages of its development, and a flower of large size, equalling, in this respect, either of its parents—*nobile nobis* and *splendidissimum grandiflorum*. The pretty *D. nobile Balleannum* was in flower here; it appears to have come over with the *Lang Tang D. nobile*, but it is clearly, from its pencilled chocolate-rayed blotch at the base of column, a natural hybrid. *D. Wardianum* is now everywhere abundant, and there seems to be no scarcity of the pure white variety of this species. It still is a prince among *Dendrobes*, and it is to be hoped that growers will have found out the proper way to keep the plants alive, say, after two years' cultivation. It has not always been so. There is a very choice lot of *Cypripediums*, one of the most striking set of well-cultivated plants being *C. bellatulum*, which is doing grandly in masses in pots suspended from the roof. The white one is going along well, as also *C. insigne Sanderæ*, which, by the way, is a rapid grower—different altogether from *C. callosum Sanderæ*, which is still worth its weight in gold pot, compost, and all! I noticed a particularly splendid raft of *Cattleya Acklandiæ*, with about fifty bulbs, nearly all leaved and in rude health. *C. maximæ* strong; and how distinct-looking is *Chamberlain's* ruby variety of *Lælia anceps*! There have been thrips among the *Cypripeds*, but they have been got completely under by the specific called "Excel," which kills the insects and the larvæ without affecting the most tender Orchid—so, at least, various parties who have used it advantageously, say. Another thing which apparently helps the vigour of the plants suspended from the roof, is the gross foliage and the moisture arising therefrom of several large-leaved stove plants in the flat below.

Another range is filled with cool-growing plants. The lot of *Odontoglossum crispum* is very choice here, and many of them were in flower at the time of my visit, comprising both white and spotted forms. There is such a variety in this, the queen of *Odontoglossums*, that commands universal admiration. The *O. Pescatorei* is also fine. There were several *O. Andersonianum* in flower—very good in their way, but the flower I saw of Major Massin's variety, which had a First-class Certificate the other week at the Royal Horticultural Society's meeting at the Drill Hall, by far eclipses any form that has come within my cognisance; the one I flowered more than twenty-nine years ago was a poor thing in comparison. *Odontoglossum triumphans* is always notable from its clear-yellow ground and Indian-red blotches; the yellow and bronze *O. scepterum* was in flower; and the yellowish or citron-coloured *O. humeanum* with its flushed segments adorned with spots at the base, is very pretty. *Oncidium macranthum* is in quantity, bristling with its trailing flower-spikes, delighting in the cool moist climate. *O. serratum* was in flower, and useful it is in a collection. *O. cucullatum*, with its violet spots so densely placed on labellum contrast well with its olive segments; and the *O. olivaceum Lawrenceanum* is after the same character in its flowers, but much more minutely spotted. The fine scarlet hue pervading the flowers of *Cochlidium Roeziana* tells well in a group.

In the adjoining house were quantities of *Celogynæ*, now so plentiful and so cheap, *cristata* and its forms. *Cymbidium Lowianum*, with its hand-

some curving racemes, is here in fine style, and is becoming a greater favourite than ever—for designers it is useful in framing their conventional forms. *Brassia verrucosa* is another of the useful sort in the same way, and whose grotesque flowers take immensely with visitors. The plants of *Miltonia vexillaria* are in fine order, quite clean, vigorous in health, and comprise some of the finest forms and colours. The collection of *Masdevallias*, both the bella and *nycterina* and *macrura* section, and the *Harryana*, *Veitchiana*, and the tiny lot of which *Shuttleworthi* is one of the more primæval, are all well cultivated in this same climate.

In the third range, which stands on a position more elevated than the others, stands some very choice plants. *Dendrobium × Venus*, for instance, is in magnificent health, and has had over forty flowers on it, with many still remaining. This remains still one of the finest of the earlier crosses, and varies—at least, I have noted four distinct varieties of it; it is a good grower, if kept clear of red-spider and thrips. *D. thyrsoiflorum*, in good variety as here, brightens up a miscellaneous group. Some of the forms of *Cattleya citrina* are admirable; and one here with the deep citron-coloured segments and the gorgeous yellow lip with the varnished-looking finish, was admirable. *Lycaste Skinneri alba* is always nice to look at, as is *D. primum*, with its pendent pseudo-bulbs covered with cream-coloured flowers. *Cattleya Trianaei delicata* has a soft loveliness, which contrasts well with the hairy-punctured, weird-looking coloured *Cypripedium hirsutissimum*, of which several were in flower. *Epidendrum vitellinum* was strongly grown, suspended from the glass.

In the *Cattleya*-house adjoining were several choice plants; the plants of *C. Lawrenceana* grow well here. There is a splendid piece of *Cattleya Hardyana*, which like all the *Dowiana aurea* section, seems to grow freest with the air moving about roots and pseudo-bulbs, which it can do best when the plants are suspended. *C. Trianaei alba*, *C. Skinneri alba* in several plants, some of the best forms of *C. Mendelii C. labiata*, and others were remarked. There are many hybrid seedlings being nursed along; the collection of *Lælias* is a choice one, including the best form of *tenebrosa*, *elegans*, and the *anceps* section. *Brassavola*, or rather *Lælia Digbyana*, is coming into flower, and seems to do well in a smallish pot along with the *Cattleyas*; the *Sobralias* were doing well, treated as terrestrial Orchids, the best among them being the white-flowered *Kienastiana*. It has often been said by several writers on Orchid culture that there is no royal road to success. Some get it one way, some another. Here, for instance, there is no double staging, no extraordinary provision made for the holding and giving off of moisture supply, no pet system of house-building or of ventilation, and yet Mr. Pidsley, Mr. Ashcroft's able gardener, manages to cultivate his plants, and improve their condition, the *Odontoglossums* and the *Cattleyas* in particular catching one's eye. Strict attention to the wants of each plant, and general cleanliness, are the main factors towards success, and a notice to that effect might be usefully placed on the inside of every botchy door. J. A.

## COLONIAL NOTES.

### JAMAICA.

The *Bulletin of the Botanical Department, Jamaica*, for March, edited by Mr. William Fawcett, includes, among its contents, papers on the "Agricultural Chemistry of the Sugar-cane," by T. L. Phipson; "Cultivation of Tomatoes," by W. Cradwick; "Notes on Oranges and Lemons," "Pasteurisation of Milk," "Orchids at Hope Gardens," and Mr. Jenman's "Synoptical List of Ferns" (continued). The Appendix I. of the *Bulletin* contains "Elementary Notes on Planting and Care of Woodlands," chiefly from Schlich's *Manual*; "Report on the Colonial Herbarium for the Year 1895," by J. Medley Wood, Durban.

FIG. 81.—PSESTIS, AS CULTIVATED AT ROUND OAK, ENGLAND. GREEN  
See Cultural Notes by the Gardener, Mr. A. Sturt on p. 47 April 11.

## THE ROSARY.

### NEW ROSES FOR FORCING AND CUTTING.

WE note in a German periodical the following varieties are praised by some commercial Rose growers as being excellent forcers:—Maman Cochet, Madame Caroline Testout, Kaiserin Auguste Victoria, White Maréchal Niel, Golden Gate, Fiametta Nabonnand, Hippolyts Barreau (hybrid Tea), Paul's Early Blush, Grace Darling, The Bride, and Augustine Guinoisseau.

## THE WEEK'S WORK.

### FRUITS UNDER GLASS.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

**CUCUMBERS.**—These plants being now in full bearing, copious root-waterings, with alternative applications of liquid-manure, and an occasional sprinkling with some artificial fertiliser, such as Clay's or Thomson's, should be afforded. Air-moisture will need to be afforded by damping the paths and borders, and the foliage should be syringed in two directions at closing time. Shading will not be needed before the plants begin to flag during bright sun, when some light scrim may be put over the glass. If there is much flagging, the state of the soil as regards moisture ought to be examined, for although the bed may appear wet on the surface, it may be dry below. Plants for succession should be planted as pits or houses become cleared of French Beans, Potatos, &c. For summer Cucumbers, the soil should be strong and retentive, roughly chopped up, and have some rich, rotten manure added to it. Should green or black aphid or thrips put in an appearance, gently fumigate the house several times. Cucumbers planted on dung-beds should have the daily waterings or sprinklings done sufficiently early in the afternoon to permit the foliage to become dry before nightfall. A good bottom-heat should be maintained in these beds by renewing the linings. Close early in the afternoon to husband sun-heat and employ thick coverings whilst the nights remain cold. Woodlice may be trapped in 5-inch flower-pots filled with hay, and placed with the mouth next the side of the frame or pit, a slice of Potato being put into each pot as bait.

**FIGS.**—As the fruit on the earliest trees approaches the ripening state, free ventilation should be afforded them whenever the weather is favourable, leaving a small opening during the night. The supply of water and atmospheric moisture must be somewhat reduced. Whilst the fruit is swelling freely, the trees, and especially those in pots, can scarcely have too much water at the root, liquid-manure being, provided the drainage is good, frequently afforded. Keep up a moist atmosphere by syringing and sprinkling the house twice a day; close early, but giving a small amount of air at 75°. Planted-out trees will benefit much by mulchings of half-decayed rich manure. The ammonia arising from this manure will greatly assist in keeping red-spider in check, as well as add vigour to the trees. Later crops, as soon as the trees are in full leaf, may be allowed a night temperature of 60° to 65°, rising to 75° in the daytime, with a further rise of 10° by sun-heat. Young trees in pots should be re-potted into larger-sized pots as may be required, but these shifts should not be large ones, it being better to re-pot three or four times till they get into 12-inch pots, than to give too much space at one time. In re-potting, afford plenty of crocks, and as a potting-soil, use a rich turfy loam, not too heavy, to which one-sixth of old mortar rubbish should be added, a little well-rotted manure, and a sprinkling of half-inch bones, pressing it firmly about the roots.

### THE FLOWER GARDEN.

By HEDLEY WARREN, *Gardener, Aston Clinton, Tring.*

**GARDEN-WALKS AND LAWNS.**—Garden-walks should now be in good condition, if due attention has been given to rolling them after rain has fallen. Continue to mow grass lawns, and continue the trimming of grass verges. Any of the lawn which has been lately sown with grass seeds should not be cut too close for some weeks to come; in fact, it is better to mow such parts with scythes only, until a close sward is obtained.

**FLOWER-BEDS AND WALLS.**—Give support to all bulbous plants in cases where the spikes of bloom are liable to be snapped off or displaced by wind or rain. Take notes of the particular arrangement of the plants in the beds this season, and of any improvements which may appear desirable to make another season. Creepers on walls and verandahs will require attention, in order to prevent the growths from becoming entwined, which would cause an amount of labour and waste of time later on.

**BEDDING PLANTS.**—Preparations should be completed for hardening these off, and the pricking out of various seedlings, such as Zinnias, Stocks, Asters, Marigolds, Pyrethrums, &c., continued. There is still time to pot off quick-growing plants, such as Coleuses, Iresines, Heliotropes, Petunias, Verbenas, Zeas, &c. Hardy annuals may yet be sown, and successional sowings of Mignonette, Sweet Peas, Virginian Stock, &c., made. The dividing up and planting of Violet roots ought to be completed as soon as possible, so that growth may commence before dry weather obtains.

**HERBACEOUS AND CARNATION BORDERS.**—These should be kept clean by the use of the Dutch-hoe, taking great care not to injure any plants that may be just appearing above the soil. Borders intended for early-flowering Chrysanthemums should be enriched by the addition of a good dressing of rotten manure, and a sprinkling of soot added. Afterwards well dig the ground, as the plants may shortly be put out, if due attention to the hardening off of the latter has been given. Seedling Carnations intended for beds or borders should be potted on as occasion requires. For border culture, seedlings obtained from a good strain are quite equal to named sorts, and they afford a larger quantity of bloom. The Marguerite and Grenadin sections are now mostly used for early flowering.

**ISOLEPIS GRACILIS.**—It may not be generally known that this useful sedge, which is mostly used for indoor decoration, makes an admirable plant for beds. In raised beds and borders it makes an excellent edging plant. A sunny position suits it best, and if dry as well, it will thrive, and bring out the beautiful blue tint seen only when freely exposed. It associates well with most bedding plants. If old plants are now divided, and grown on in gentle heat, they will be suitable for bedding-out at the time they are required. It is also easily raised from seed, but this should be sown early in the season.

**FUNKIA SIEBOLDI** is one of our most showy plants for the open border, and it affords excellent spikes of bloom. The plants should be divided when growth has commenced, and then planted in a moist and shady position.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Burton-on-Trent.*

**STRAWBERRIES** on warm borders are now pushing up their trusses of blooms, and if the ground between the plants was cleaned of weeds, and afterwards mulched with a dressing of half-rotten manure, as was advised on p. 46, there will probably be sufficient clean material remaining to protect the fruits from contact with the soil. If more is required, add a little of the lough stable-litter, which should be worked well round the crowns, at the same time being careful not to bury any of the foliage. If a little of the straw-like material be taken from the alleys and laid lightly over the trusses of bloom in the evening, when sharp frost is expected, it may be the means of saving the best part of the crop, as the first trusses of bloom invariably produce the finest fruit. Plantations two or three years old may be greatly strengthened during the flowering period if one or two soakings of manure-water, taken from the cesspools attached to the stables or cow-sheds, are given, diluting it according to the strength of the liquid. Nitrate of soda also, if broken up finely, passed through a sieve, and sprinkled evenly over the beds at the rate of 2 lb. to the square rod, will be found very helpful, especially if the season be a dry one. Such a stimulant must be kept from touching the foliage. If, owing to pressure of other work, the beds have not yet been attended to in regard to trimming off the old leaves, clearing off runners and weeds, and putting on a mulching of manure, let nothing interfere with the effecting of such work at once. A good dressing of soot dusted well into the crowns is one of the best remedies against slugs and other insects, besides being very beneficial as a manure.

**GRAFTED TREES.**—Where clay has been used for covering the grafts, it should be examined every few days during dry weather, and if it is at all likely to crack, rub some soft clay into the cracks, and well damp the whole mass. If some moss be tied over the clay and kept damp, it will, in a great measure, prevent cracking. Attend to the removal of any growths from the stocks as soon as they appear.

**PROTECTION.**—If two or more thicknesses of fish-netting are being used in the protection of the blooms of Apricots, Peaches, and Nectarines, a portion of this may now be removed, leaving one thickness only for a while longer. As soon as the foliage is sufficiently abundant to cover the fruits, the remaining portion may also be taken away.

### PLANTS UNDER GLASS.

By JNO. MCINTYRE, *Gardener, Woodside, Darlington.*

**WINTER-FLOWERING CARNATIONS.**—The propagation of these should now be commenced. The following method has proved very successful here: Prepare a frame in which to plant out the old stock plants, and then carefully layer them. Use loam which is free from wire-worm, and add leaf-soil and river-sand. As soon as the layers are well-rooted, pot them into 3-inch pots, and plunge them to the rims in sifted leaf-soil for the purpose of protecting pots and young roots from the hot sun.

**TUBEROUS BEGONIAS** sown in February, and having been pricked-off into pans or shallow boxes, will now be ready for potting singly. Use thoroughly clean 3-inch pots, and drain well. Good loam and leaf-soil in equal parts will suit them well. For plants to be used for bedding purposes, this sized pot will suffice until they are planted out, but those required to flower in pots, must be re-potted as soon as the plants are well rooted. Place them on shelves near the glass where there is a night temperature of 60°.

**BERTOLONIAS.**—These plants are far too delicate to be used for ordinary decorative work, they should be grown in a corner of the stove, and if rockwork is used, and a few dwarf trailing plants or Selaginellas are interspersed, they may be made most attractive for the summer, and can be returned to the cases in winter.

**DRACÆNAS** raised from eyes last season ought now to be ready for removing into 5-inch pots, and this is the most useful size for all purposes. D. Goldieana requires dense shade in order to develop and retain the decorative markings in the foliage. All Dracænas are best potted in two parts peat, one loam, one leaf-soil, and a good sprinkling of coarse Reigate-sand. Water containing much lime should not be used for syringing Dracænas, as to renders frequent hand-sponging necessary; in such a case it is better to damp the surfaces in the house only.

**ZONAL PELARCONIUMS.**—Good cuttings will now be available from plants which have flowered through the past winter; these should be taken in order to furnish a stock of plants for next season. The best method is to fill thumb-pots with sifted loam, leaf-soil, and river-sand, and insert one cutting in each. Place them on a shelf near the glass in the greenhouse, and give them a good watering, after which little water will be required until they are rooted. Remove all flowers as they appear. Specimen plants will now have made good growth. Continue to remove all flowers as they appear until within six or seven weeks of the date they are required to be in full bloom. At every other watering use liquid-manure, and there is none better than guano for these plants. Fill a muslin-bag with this, and when watering simply wet the bag in the watering-pan and squeeze it until the water is nicely coloured.

**FUCHSIAS.**—Spring cuttings of these will now require shifting into 4 and 5-inch pots. Use good loam, leaf-soil, and spent Mushroom-manure, in equal parts, and add a little river-sand. Give Fuchsias a moist atmosphere while young, and pinch all side-shoots until within six weeks of the time they are required to flower. Pinch all side-shoots regularly from specimen plants also. Water regularly with liquid-manure, that obtained from sheep droppings preferably. If the plants are wanted for show purposes, remove all flowers as they appear until within eight weeks of the time they are wanted. In dry weather much labour is saved in watering if the pots are plunged.

**CROTONS.**—These are making rapid growth, and are now beginning to colour a little. The collection should now be looked over and all plants given their final shift for the season, so that they may fill the pots with roots, and afterwards have a long period for colouring. If it is desired to obtain as large plants as possible in one season, repeated shifts may be given at the expense of colour, for I have found that if Crotons are kept growing fast, the leaves colour unsatisfactorily. Crotons should never be shaded, exposure to sun is a most important factor in producing well-coloured plants. The house may now be shut up early each day at a temperature of 100°, keeping at all times an abundance of moisture in the house. Syringe the plants when shutting up the house with soft rain-water. Specimen plants, if healthy at the roots, will be benefited by being watered twice a week with liquid-manure from the farm-yard, or a weak solution of one of the many good chemical manures.

### THE KITCHEN GARDEN.

By C. HEARIN, Gardener, Drogheda, Maidenhead.

**CELERY.**—Plants from the earlier sowings to furnish the main crop of Celery will be large enough to be pricked off into cold frames stood on a hard bottom of coal-ashes. Over the coal-ashes, a layer of spent Mushroom-bed manure should be spread to the depth of 3 inches, and on this a 2-inch layer of moderately fine soil. The whole should be made firm by lightly trampling it, and a fine surface given it with a rake. The plants should be pricked out at 3 inches apart, affording water with a fine rose can, and the lights kept rather close, and shade from bright sun given until the plants have become partially established; air being given after that time in sufficient quantity to prevent the least spindling. A small sowing of Celery may be made, choosing a variety that is adapted for late use, of which, I may remark, Standard Bearer is a good example. Sow the seeds in a frame, or under hand-lights; or, in lack of these, in a warm corner, and after sowing, cover the seed-bed with a mat till it germinates. If the seeds are thinly broadcasted, the plants in this bed may be transplanted direct into the trenches when large enough to be readily handled. Plants raised in frames, &c., will in most cases require to be pricked out.

**CARDOONS.**—Seeds may now be sown three in a 4-inch pot, three-quarters filled with a moderately light kind of soil. When up, thin out the weaker, leaving one plant to a pot. Stand the pots in a frame, and keep close until the seedlings appear above-ground. The plants should be strong enough for planting out in about a month after sowing. Trenches for Cardoons should be similarly prepared to those in which Celery is grown, planting at 18 inches apart in the row, and if a number of rows of plants are grown, the rows should not be nearer together than 4 feet.

**CHICORY.**—If roots are required for affording winter salading, seed may now be sown on ground prepared as for other root-crops. For convenience of cleaning the ground it is advisable to sow in drills, which should be drawn half-inch deep and 12 inches apart. The large-leaved Brussels or Witloef is the best variety.

**VEGETABLE MARROWS.**—Plants from the earliest sowing will be now ready for planting out, and in view of cold nights they should be covered for a time with hand-lights. A sowing may be made in pots placed in mild heat, and also in the open ground, dibbling in the seed where the plants are to remain to fruit.

**PEAS.**—Early-sown transplanted Peas have made good progress, and the sheltering with mats on cold nights should still be followed up. Efforts should be made to forward these as much as possible, early dishes of Peas being always appreciated. The common sparrow has been troublesome here of late, eating the young growths of the Pea-plants, compelling me to use netting to protect the dwarf varieties, and often sprinkle the taller ones, which have their sticks put to them, with soot. Successional sowings of Main Crop Peas should continue to be made at intervals of ten days or thereabouts. Assuming that the land was heavily manured and trenched, broad drills, with a flat bottom, and 6 inches deep, should be drawn, sowing the seeds thinly therein, covering them to half the depth of the drill, so that the plants when they come up will be 3 inches below the ground-level, for convenience of watering and mulching in dry weather. If the Pea crop must follow another where the ground has

not been properly prepared, a trench 2 feet wide and deep should be taken out, some rotten manure incorporated with the soil, and the seeds sown in the above manner. As a tall variety, the old Ne Plus Ultra is still one of the best garden Peas.

**VARIOUS ITEMS.**—Owing to the mildness of the winter, a large percentage of Cabbage has bolted, and their places should be filled up with plants drawn from the autumn seed-beds. The Potatos that were the first planted are several inches high, and have had some soil drawn over them as a protection against frost; and where too high to allow of this being done, they are covered lightly with litter. Heads of Broccoli should be protected from sunshine and frost; and Lettuce tied up to blanch it when in a dry state. Hick's harly White Cos and Brown Cos have afforded us solid Lettuces for some weeks past. Any of the Brassicas running to seed should be removed without delay, trimming off the tops and digging them in the land if not wanted for other crops being planted with Potatos. The stumps of such flowering plants should be burned.

### THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorset.

**CELOGYNE CRISTATA** and its varieties thrive well in either a Cattleya or cool intermediate-house. When the plants are in a strong, healthy condition, some of the bulbs soon get beyond the limits of the pot or pan in which they are grown, and having no material to root in, they become deficient in size and unable to produce strong flower-spikes. In order to remedy this, the leading pieces around the plant may be severed with several older bulbs attached, and made up into small compact specimens; the original plant, if not disturbed, will soon send out strong young growths. Large specimens that have grown beyond a convenient size, or any that may have fallen into an unhealthy condition, may be safely divided at this season, and re-potted again into various sized pots as required. For re-potting, use a mixture of peat and sphagnum-moss, also a few lumps of turfy loam, and give plenty of drainage. After the plants have been re-potted, they require careful treatment, or it will take a considerable time to bring them to their former condition. Any root-disturbance usually causes the pseudo-bulbs to shrivel slightly, but do not deluge them with water at the roots to preserve their plumpness; rather give them an occasional syringing overhead, damp well between the pots twice or thrice daily, and shade them from strong sunshine. When well rooted into the compost, and the growths are developing favourably, the plants delight in almost unlimited quantities of water poured through the compost; and if they are given plenty of light without actual sunshine, they will make strong, healthy, flowering growths. Other species of *Celogyne*, as *C. Massangeana*, *C. tomentosa*, *C. flaccida*, *C. conferta*, *C. speciosa*, *C. elata*, *C. barbata*, *C. ocellata*, *C. Rossiana*, *C. corugata*, *C. graminifolia*, *C. Thuniana*, *C. odoratissima*, are now commencing to grow, and those plants which require it may now be re-potted. Basket culture is advisable for the first three named species, as the flowers are produced on long pendulous racemes; they are seen to the best advantage suspended from the roof. Shallow suspending pans are to be preferred for the dwarf-growing varieties, as *C. odoratissima*, &c. *C. asperata* Lowii is also making growth, but as the flower-spikes are produced simultaneously, re-potting must be deferred until the flowers have faded. All these *Celogyne*s grow well in ordinary compost. During the work of re-potting, it is important that thick pieces of crock be inserted in the compost to allow the copious supplies of water these plants require when growing to pass freely away. With the exception of *C. asperata*, a species which requires a hot moist atmosphere, all the varieties will grow thoroughly well in an intermediate temperature.

**THE CATTLEYA-HOUSE.**—Such plants as *C. Trianei*, *C. exoniensis* ×, *C. Percivalliana*, *C. amethystoglossa*, *C. Leopoldi*, *C. Harrisoni*, *C. Gaskelliana*, *C. Schofieldiana*, *C. speciosissima*, the autumn-flowering *C. labiata*, *Laelio-Cattleya elegans* and its many varieties, are in various stages of growth. Some of them are commencing to emit new roots from the last-made pseudo-bulbs, others are starting into growth, and the young breaks will quickly produce fresh roots. Such plants, providing they need room for further development, may now be re-potted, as the young roots will in a very short time establish themselves in the fresh compost. Plants

of *C. Mendeli* that have failed to produce flower-sheaths, or specimens that have deteriorated through loss of roots or other cause, will be sure to make roots at this season, and may therefore be re-potted and started afresh. Unhealthy plants should always be relieved of their flower-sheaths previous to re-potting. The pots for these *Cattleyas* and *Laelias* should be filled at least three parts with drainage, over which it is customary to place a thin layer of rough sphagnum-moss. Keep the rhizomes of each plant elevated a trifle above the rim of the pot, and tie a bulb here and there to neat stakes to hold the whole firmly in its place. Over-potting must be strictly avoided. Pot the plant firmly, using a compost of good fibrous peat and living sphagnum-moss in equal proportions, and freely mixing with it some thick pieces of crock. When the plants have been re-potted, place them on the shady side of the house, and for a few weeks water should be given the roots with great care, but the surroundings may be kept fairly moist by syringing between the pots several times each day.

### THE APIARY.

By EXPERT.

**HIVE EXAMINATION.**—The month of March is regarded by bee keepers as the beginning of the season, and it is necessary for all who wish to have a good honey harvest to thoroughly examine all their hives, and ascertain the strength of each. As this has been such a mild winter, most stocks have come through fairly well—in fact, better than for several years past; but it is most important that all bees should be fed at once (except in cases where stocks are strong, then they are better left alone), to stimulate them, and so encourage the brood, as colonies often die in the spring for the want of a little judicious feeding after wintering well. In a mild season like this, it is a good plan to commence feeding about the end of March or beginning of April, and continue till there is a natural supply of food. I find the best and easiest way is to take 10 lb. of pure cane-sugar, 7 pints of water, 1 oz. of vinegar, 1 oz. of salt, and 1 oz. of salicylic acid solution, and boil for a few minutes. The solution is made by mixing 1 oz. of salicylic acid, 1 oz. soda borax, and 4 pints of water; this should always be kept near at hand, as it is most useful for cleaning hives, spraying combs, &c., and as a safeguard against foul brood. Flour-caudry, made soft, can also be used as a spring food. A small quantity of Pea-flour mixed with a few shavings or small pieces of cork, &c., put in a small box or tin, and placed in a warm, sunny corner, will serve the bees for pollen till the natural supply comes in, after which they will discard it.

**QUEENS.**—On a warm day each hive should be examined to see if there is a good fertile queen, which can readily be ascertained by the presence of sealed worker brood; but if there are neither eggs nor brood, there is little doubt that the stock is queenless, or the queen aged and useless; in that case it is better, if the bees are in a healthy state, to unite them to one of your weakest stocks, and so strengthen them. On the other hand, if the combs are old and dirty, and the presence of foul brood is suspected, I should certainly burn them out of the way, as this disease in inexperienced hands is very dangerous. Great care should be taken after touching foul comb to wash the hands and all appliances before going to another hive.

**UNITING STOCKS.**—Uniting bees should be done on a warm day, after the hives have been placed as near together as possible; and this is best done by moving a few feet at separate times. I should then fumigate the bees slightly, and sprinkle a little flour or thin syrup, and gently brush off the bees from the combs into the stock you wish to strengthen; or, if there is space, insert a frame or two with the bees on, if the combs are clean. It should not be forgotten that water should be kept near the hives in a shallow pan or tin, with a few tea-leaves or pieces of cork placed in them, to prevent the bees from drowning. This saves the bees a good deal of time in flying in search of water, of which they consume a large quantity, especially in the spring. I would strongly recommend all bee-keepers to place on each hive a register-card, about 5 inches by 3, stating age of queen, when fed, number of frames, &c.; it can then be seen at a glance what is the state of the stocks, when last examined, &c. April is a good time for thoroughly over-looking and cleaning out all hives, burning old combs (which if kept breed wax-moth), and painting the outsides, also repairing the same.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturalists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

## APPOINTMENTS FOR THE ENSUING WEEK.

FRIDAY, MAY 1.—Geneva Exhibition opens.  
SATURDAY, MAY 2.—Dresden International Hort. Exhibition (9 days); Isle of Wight Hort. Association; Soc. Franc. d'Hort. meet.

## SALES.

TUESDAY, APRIL 28.—Imported and Established Orchids, at Protheroe & Morris' Rooms.  
WEDNESDAY APRIL 29.—Palm Seeds, Hemerocallis, Herbaceous Plants, Amaryllis, Dahlias, &c., at Protheroe & Morris' Rooms.  
FRIDAY, MAY 1.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—51.7°.

The Horticultural Season.

IN reviewing the work of the week, it will be seen that the busy season has decidedly set in for horticulturalists in the metropolis, as well as in the provinces. The Tuesday meeting of the Royal Horticultural Society was crowded, alike with exhibits and spectators. The special show of Primroses, Auriculas, and allied plants, was unusually large and brilliant. If some, who are not specialists, see little novelty in the case of the Auriculas, that is all the more interesting to the naturalist. Those, and they are but few now-a-days, who decline to accept the notion of evolution as a factor in the production of new species, who demand proofs of the development of new from old forms, and urge the necessity of putting the matter to the test of experiment, have surely overlooked the fact that for ages the gardener has, in his way, been making those very experiments. As a rule, he has not been influenced by scientific considerations, but for all that the fact remains, that he has succeeded in producing new forms which, speaking broadly, are as stable as natural productions, so long as the conditions of "environment" are not altered, and making allowance for the short time the gardener has been at work. Take the garden Auricula as a case in point. If it were not known to be of garden origin, it would be ranked by botanists as a "good species"—at least, as good as the majority of those he has to deal with. The very fact that there is no important novelty among them may surely be taken that the "species," if we may so call it, is getting "fixed." The gardener all this time has, in his attempt to raise new and improved forms, been working on the same lines as are operative under natural conditions. The parallel is doubtless, not complete, and objections may

be raised of various kinds to this view, but if all the requisite allowances be made there can be little doubt of the general truth of the proposition. For the detailed account of this interesting meeting, with its wealth of flowering shrubs, herbaceous plants, Orchids, &c., we must refer to another column.

A very pleasant incident in the day's programme was afforded by the presentation of a testimonial by Dr. MASTERS, on the part of the subscribers, to Mr. BARRON, the ex-superintendent of the gardens at Chiswick. This took the form of a cheque for £500, and was subscribed by a large body of his old pupils, his associates, and friends, who gladly took this opportunity of recognising not only his ability as a gardener and organiser, but in particular, those qualities of loyalty, fidelity, and straightforwardness, often under prolonged circumstances of depression and uncertainty, which have been such marked characteristics in the career of ARCHIBALD BARRON. The greatest cordiality, and no slight enthusiasm, prevailed. Those who took part in the matter felt a sense of satisfaction at having been privileged to render to their old friend this mark of their appreciation and sympathy.

Mr. WARD'S lecture on "Pine-apple Culture" had, unfortunately, to be read by deputy. In spite of the large importations of excellent fruit at a low price, there is no doubt that a good English Pine can more than hold its own in the competition, and, as its production puts to the test the skill and watchfulness of the gardener, it is to be hoped that those who are not tied by mercantile considerations, will still continue to cultivate the king of fruit. When the electric light comes into use in gardens, as sooner or later it will, the time required for ripening Pines will be materially lessened.

The death of M. LÉON SAY, whose portrait we give in the present issue, deprives the National Horticultural Society of France of its honoured President. The world knew M. SAY as a statesman and an economist; few in this country, at least, knew of his association with horticulture; but those who were present at the last Ghent Quinquennial, will remember his important speeches on the subject. Since the centenary celebration of the Institute of France last November, many of those who took part in those imposing celebrations have been removed by death, and among them none more distinguished in his way than M. LÉON SAY.

Whilst we are thus commenting on the events of the week, we may fitly notice the appearance of some NEW BOOKS, all of which are of great moment to horticulturalists, and to all of which we must allude at greater length on another occasion. Prof. SARGENT has issued another volume of his monumental work the *Silva of North America*, devoted particularly to the Willows and Poplars. It is only necessary now to say that the present volume presents all those characteristics which have placed the previous ones in the first rank of horticultural literature.

Less ambitious, but appealing to a larger community, is a dainty little volume entitled the *Bamboo Garden*, by Mr. A. B. FREEMAN MITFORD. Those who have read Mr. MITFORD'S contributions to the *Garden*, the *Journal of the Royal Horticultural Society*, and to those columns,

will welcome the publication in a revised and orderly form of the valuable information which Mr. MITFORD has got together, and will admire the judgment, skill, and literary facility he has shown. The little volume is much too important to be thus summarily passed over. We can now only mention its publication by Messrs. MACMILLAN & Co., and advise those interested in hardy Bamboos to make themselves possessors of the work.

Another work, of which an instalment is before us, is the *Flora Capensis*, originally begun by the late Drs. HARVEY and SONDER, but, which, unfortunately, has been allowed to remain incomplete for many years. Now that the publication has been recommenced under the editorship of the Director of the Royal Gardens, Kew, it may be hoped that it will be brought to as speedy a conclusion as the necessities of the case will permit. The area now dealt with is much larger than was the case in the earlier volumes, so that we shall ultimately have a complete flora of South Africa from the Cape to the tropics, where it joins on to the territory whose flora is dealt with in the *Flora of Tropical Africa*, a work also unfortunately discontinued for many years. We may trust that this *Flora* will also be completed as soon as possible. The large accession made to our knowledge by the Germans will necessitate a revised and completed edition of the earlier volumes of both the works we have mentioned—or, at least, a full supplement. The part of the *Cape Flora* before us is of particular interest to horticulturalists, as it deals with Cape bulbs of all kinds, in other words, with the Iridaceæ as a whole, and with the Amaryllidaceæ in part. Subsequent issues will therefore be devoted to the Lilies, Orchids, and other allied plants. The present part is entirely the work of Mr. J. G. BAKER. The publishers are Messrs. L. REEVE & Co.

BAMBOOS IN GENERAL HUTCHINSON'S GARDEN, BOURNEMOUTH.—In the illustration on the opposite page (fig. 81) is seen depicted a fine group of *Arundinaria japonica* or *Bambusa Metake* at Owthorpe, Bournemouth. The group consisted originally of four clumps about 6 feet high and 2 feet wide, which were planted in a sheltered situation with a sandy bottom, about nine years ago, and they are now a dense brake reaching 15 feet in height, and 60 feet in length. Behind them is a small clump of *Bambusa aurea*, together with *Camellias*, which in their season bloom well. Now that it is ascertained beyond doubt that several species are sufficiently hardy to endure our winters without protection, the plants should find a place in gardens, the soil of which is naturally porous, warm, and not too poor. To preserve the full beauty of the foliage of the plants, they should occupy a situation sheltered from the prevailing cold winds.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The monthly meeting of this society was held on Tuesday, April 14, at 25, Westgate Road; Mr. JOHN BELLOCK occupied the chair, and there was an excellent attendance. Mr. RUSSELL, Bensham, Gateshead, read a very able paper on "The Cultivation of the Lily of the Valley," embracing its ordinary garden culture, forcing, &c. Mr. RUSSELL also explained how, by means of having the crows stored in refrigerators, &c., bloom can be had many months of the year. A lengthy discussion followed, from which emanated much useful information.

THE ROYAL GARDENS AT LAEKEN.—The royal conservatories at Laeken, near Brussels, are now opened to the public during the end of April and the beginning of May. On the 20th of April, the members of the Société Royale d'Horticulture of Antwerp were admitted to Laeken, and also paid a visit to the houses of l'Horticulture Internationale.

**SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.**—The monthly meeting was held at the Parish Room, Shirley, Southampton, on the 20th inst., when Mr. B. LADHAMS, F.R.H.S., presided, and the attendance was very good, which was especially encouraging as this was the first meeting of the third financial year. A capital paper on the Culture of Tomatos, was given by Mr. CURTIS, The Gardens, Springhill, Southampton. Mr. CURTIS sought to impress his remarks on his audience by exhibiting

Mr. Prince rendered to Rose growers throughout the kingdom in popularizing the growth of the Tea-scented Rose, by establishing a fund which shall be devoted to a prize to be annually competed for at one of the exhibitions of the National Rose Society, for the class of Roses for which he did so much. The form which it will take will be determined upon at a meeting of the subscribers, which will be held at some future time; the project has already received the approval and help of many of our leading professional and amateur Rose-growers, who valued him not

10s. 6d.; Rev. A. Foster Melliar, 10s.; J. D. Pawle, Esq., 10s.; J. T. Strange, Esq., 10s. 6d.; Edward Mawley, Esq., 10s.; Messrs. Geo. Bunyard & Co., 10s.; S. P. Bull, Esq., £1 1s.; Rev. H. H. D'Ombraim, £1 1s.; and the Rev. H. A. Berners, £1 1s.

**GARDENERS' REFERENCES.**—It is a matter of common knowledge that gardeners when seeking new situations part with the originals of the references and testimonials. Now this is always a risky proceeding, as owing to inadvertency, lack of time, and

FIG. 81.—CLUMP OF BAMBOOS, IN THE GARDENS AT OWTORPE, BOURNEMOUTH. (SEE P. 524)

plants, seedlings, &c., crowded, starved and neglected, whilst others sown at the same time showed the difference which care and timely attention would make, by their short and sturdy growth. Not favouring the planting-out system, Mr. CURTIS thinks Seakale-pots better than the ordinary po's, the plants grown in them not requiring to be watered so frequently, as the former are so much thicker. Strict attention to atmosphere and ventilation, Mr. CURTIS thinks, would prevent disease appearing. A hearty vote of thanks to Mr. CURTIS was accorded at the close of the discussion which followed his reading.

**THE GEORGE PRINCE MEMORIAL FUND.**—It is proposed to commemorate the services which the late

only for his enthusiasm as a rosarian, but also for his kind and genial character. Subscriptions will be received by the Rev. H. H. D'Ombraim, Westwell Vicarage, Ashford, Kent; Edward Mawley, Esq., Rosebank, Berkhamsted, Herts, hon. secretaries of the National Rose Society. The following have been already received or promised: the Very Rev. the Dean of Rochester, President of the National Rose Society, £5; Miss Slay, £3 3s.; Messrs. Veitch & Son, £2 2s.; C. J. Grahame, Esq., £2 2s.; E. B. Lindsell, Esq., £1 1s.; H. V. Machin, Esq., £1 1s.; Messrs. Paul & Son, £1 1s.; Mr. B. R. Cant, £1 1s.; Mr. Frank Cant, £1 1s.; Rev. J. H. Pemberton, £1 1s.; C. E. Shea, Esq., £1 1s.; Messrs. Prior & Son, £1 1s.; Mr. J. Burrell, £1 1s.; Rev. F. R. Burnside, 10s.; Joseph Hanbury,

downright disinclination sometimes, we fear, on the part of employers to undertake the trouble of returning these credentials, the senders never see them again. A correspondent writing on the subject insists that young gardeners and others, when they have spare moments should make a few copies of their testimonials, and when applying for a situation, send these, unless the originals are asked for. Were this more commonly done, we should hear fewer complaints concerning the retention of valuable papers.

**GENEVA.**—We learn from Geneva that the exhibition of hardy plants will be of unusual magnitude and interest. Conifers and alpine plants will be largely represented.

**THE SURVEYORS' INSTITUTION.**—The next ordinary general meeting will be held on Monday, April 27, when a paper will be read by Mr. R. F. GRANTHAM (Associate), entitled "Rivers Conservancy and Pollution." The chair to be taken at 8 o'clock.

**THE ABBÉ DELAVAY.**—We regret to hear from the *Journal of the Horticultural Society of France* of the death of the ABBÉ DELAVAY, to whom botany and horticulture owe the introduction of so many interesting plants from Yunnan.

#### A SUMMER SCHOOL OF ART AND SCIENCE.

—A prospectus is to hand of the arrangements for the meeting to be held next August at Edinburgh, in connection with which lectures will be given by competent authorities. In the section devoted to Biology, ten lectures on Applied Botany will be delivered by Mr. ROBERT TURNBULL; and a similar number of addresses on The Biology of the Seasons, by Mr. J. A. THOMSON. Mr. ROBERT TURNBULL has also arranged to hold meetings devoted to Practical Botany, the first to be devoted to the study of Fresh-water Algae, the next four to various Marine Algae, the sixth and seventh to Mosses and Ferns, the eighth and ninth to Typical Tissues of Monocotyledons and Dicotyledons, and the tenth and last to the Histological Study of the Diseases of Plants. The meeting will be held in the University Hall; the first part from August 3 to 15; the second from August 17 to 29. As various branches of other sciences and of arts receive as much attention as does botany, it will be well understood that the various classes and lectures offer an excellent opportunity to students able and willing to attend them. The executive committee contains the names of Professor GEDDES, Professor WENLEY, J. A. THOMSON, J. C. GOODCHILD, Miss JANE HAY, and F. R. MARR, Secretary.

**WEED-KILLER FOR CIDER.**—A mason named TURNER died at Stockland, near Axminster. Becoming thirsty, he drank from a jar what he supposed to be cider. At the inquest a verdict was returned that he died through accidentally drinking weed-killer from a stone jar in mistake for cider. The jar was labelled poison.

#### THE BIRMINGHAM GARDENERS' ASSOCIATION.

—On Tuesday, April 14, a very interesting exhibition of Auriculas was held in the society's room at the Athletic Institute in competition for the prizes offered by the committee; Mr. WALTER JONES in the chair. Prizes were likewise offered for Polyanthus, but none was represented, except single pips of that still perfect good old variety, "George IV.," with its exquisite gold-laced edging. The three prizes offered were worthily awarded to that well-known amateur grower and successful exhibitor of the Auricula, Mr. Clements, of Harborne, for plants of "Duke of Wellington," "Negro," and "Minnie." He also showed—not for competition—examples of alpine Auriculas. A short but practical treatise was furnished by Mr. JOHN POPE, King's Norton Nurseries, who was unavoidably absent. It dealt principally with the older varieties of the Auricula and Polyanthus. An interesting discussion was taken part in by several of the members, and hopes were expressed that the show Auriculas and Polyanthus would again attain ere long to the position they formerly enjoyed among Birmingham growers. *The Birmingham Daily Post*.

#### PRIZE ESSAYS ON HARDY FRUIT GROWING.

—The prize essays of Mr. LEWIS CASTLE and Mr. S. T. WRIGHT on this subject have been reprinted as a separate pamphlet, together with the report of the Fruit Conference, held under the auspices of the Royal Horticultural Society at the Crystal Palace in September last.

**THE "BLUE" PRIMROSE.**—Visitors to the spring meetings of the Royal Horticultural Society for years past have been familiar with the "blue" Primroses raised by Mr. G. F. WILSON, and the stock of which has now passed into the hands of Messrs. VEITCH & SON. These gentlemen lately exhibited some of

these flowers before the National Horticultural Society of France, where they excited great attention. Does not this delay show that the relations between the two Societies should be much more intimate than it is?

**EVERYBODY'S GUIDE TO POULTRY-KEEPING:** By DENZIL SHERRATON. (London, Saxon & Co.)—"Everybody" is supposed to be familiar with the series of little books of which this is one. The *Poultry-Keeping* issue is quite worthy of its predecessors: it contains a maximum of reliable information in a minimum space, all so arranged as to be handy for reference, and well indexed. Its size, completeness, and cheapness bring it within the reach of all poultry-keepers, the poorest of whom have now no excuse to offer for ignorance or mismanagement of their charge.

**PUBLICATIONS RECEIVED.**—*Proceedings of the Agricultural and Horticultural Society of India.*—*Canadian Horticulturist.*—*Tropical Agriculturist.*—*Journal de la Société Nationale d'Horticulture de France.*—*Bulletin de la Société Royale de Botanique de Belgique.*—*Le Jardin de l'Herboriste*, par H. #### AUSTRALIAN WILD FLOWERS.

The collection of 100 water-colour drawings by Mrs. F. C. Rowan, on view at the Dowdeswell Galleries, Bond Street, is one which no lover of flowers or artist in flower-drawing or painting ought to miss seeing. They form but a small part of Mrs. Rowan's collection, and in accuracy of delineation and colouring, and graceful and withal natural posing, they do not come second to the renowned collection of the late Miss North, now located at Kew. Many of the plants delineated are new to botanists, and come from parts of Australia hitherto not trodden by the white man; and, as is observed in the preface to the catalogue, they have been "obtained at great personal risk, and nearly always under most trying circumstances." Many of the species and varieties depicted were named by Baron Sir Ferdinand von Mueller from dried specimens which the artist sent him from time to time, and some few are still unnamed. We will take some of those which come from Western Australia first, viz., *Kenodrya coccinea*, a large bunch of rosy-crimson tinted, Pea-shaped blossoms having a greenish-yellow centre. In No. 5 we have a group of Stylidium, plants worthy of garden culture for their well-furnished racemes of pink-coloured flowers. The everlasting of this part of the Continent offer some pretty species, in much variety of colouring; and the Goodenias, especially *cœrulea*, should make good garden plants, being of moderate growth, and possessing pale blue flowers, bearing much resemblance to *Pimeleas* set terminally on slender stalks.

*Eucalyptus ficifolia*, a forest tree, with brilliant scarlet flowers, and black-blue seed-vessels, 1½ inch in diameter, must be a splendid object. A beautiful *Dillwynia*, possessing blue and white flowers, and Heath-like foliage, would add a charm to our greenhouses. The *Hovea chorizemifolia* has blossoms not so dark as those of *H. Celsii*, but they are of about the same size, and similarly disposed on short panicles; good for the greenhouse. *Calythrix muricata* is a small bush, and fit, therefore, for pot-culture; the flowers

are variously white, red, purple, violet, disposed in corymbs, and the leaves are small and pinnatifid. *Marianthus ringens* would make an excellent creeper for the warm house; the flowers are orange-coloured, and we do not remember any plant in cultivation that it resembles. An unnamed myrtaceous plant from this region has brilliant pinkish-red flowers closely set as terminal and axillary corymbs or sprays, a fine warm greenhouse plant, growing about 3 feet high. Another is *Huegelia* species, a plant with Malva-like blossoms in various colours, and, as Mrs. Rowan informed us, very free to flower. *Aster Exsul* (= *Olearia rudis*) grows to a height of 3 feet, has lilac-coloured rays and a yellow disc, the diameter of the blossom being 3 inches; it should succeed in our greenhouses.

The *Verticordias* are evidently favourites with the artist, often met with in the collection, and we had the wish that the plants were equally liked by our gardeners, the colours of the flowers being bright and cheerful, and the habit of the plants neat. The *Melaleucas* from W. Australia are so far new to gardens. The species were unnamed, and we can only remark on the beauty of the flowers, and their peculiar form. The habit is said to be neat, fitting them eminently for glass-house culture here. Of *Hibbertias* (*Candollea*), there were several species; and of *Pimeleas* several species, red, white, rose, and yellow-coloured flowers were pretty, especially the yellow one.

*Tetradlea nuda* is a pretty greenhouse plant with variously coloured flowers, so we may assume these represent varieties. A gorgeous flower of light purple broadly expanded, the lower half of each petal suffused with white, is seen in *Hibiscus Huegeli*; *Kenodrya nigricans* is a singular-looking species with yellowish-green and black flowers, and furnished with trifoliate leaves. *Andersonia cœrulea* is a neat flowering greenhouse plant, the colour of the blossoms blue. *Noytia floribunda* is the Christmas-tree of Western Australia. It exhibits masses of orange-coloured flowers in huge spikes, each flower an inch in diameter, and consisting of narrow petals flatly spread out. *Calythrix* variable is another plant which might make an excellent greenhouse subject. *Balaustion pulcherrimum* is a neat-habited scarlet-flowered shrub (*Myrtaceae*).

Plants which are natives of Queensland form an important part of the collection, and we will indicate some of the more striking and remarkable of the in. Some beautiful varieties of *Epacris impressa*, well drawn and arranged. *Bombax malabarica* is a gorgeous flowering tree, the flowers consisting of five somewhat reflexed petals of fleshy consistency, of a scarlet colour, with purple anthers; it reaches to a height of 90 feet. *Erythrina indica* has a dense spike of flowers of pinkish apricot-yellow, and if the plant could be cultivated in the stove or intermediate-house, it would be a nice addition to those species from cooler countries grown in the cool greenhouse. An excellently-drawn example of *Nymphaea stellata* was remarked; the unnamed species of *Tecoma* is *T. jasminoides* of English gardens. Close by was a pretty form of *Passiflora* with yellow flowers. A capital figure of *Asclepias curassavica* was remarked, in vigour greatly exceeding what one is accustomed to see here under glass. The Cotton-tree of Queensland, *Cochlospermum Gillivraei* (*Bixaceae*), has rich orange-coloured flowers and large seed-vessel, resembling in shape those of *Eucalyptus* generally, but, unlike those, the shell is soft. When the pods burst, the cottony substance in which the seeds are embedded is exposed. A species called *Cerbera* (specific name not given) has tubular flowers of a yellow colour, and long attenuate leaves; is a showy plant, but probably too large for ordinary glass-houses.

New South Wales furnishes a contingent of flowering plants better known in English gardens, and we will mention a few of the more remarkable:—The evanescent *Patersonia glabrata* (*Iridaceae*), a number of varieties of *Epacris*, some of the gay-flowered and singular-looking (*Grevilleas*, *Araujia albens*, *Gossypium Sturtii*, and *Clematis aristata*, a very floriferous plant, the flowers white, and bearing a great resemblance to

those of *C. lobata*. A beautiful *Hibiscus rosa sinensis* came from New Guinea, also several pale-coloured Orchids; a brilliant flowering *Erythrina* from Murray Island, unfortunately of too large a growth for our glass-houses.

## HOME CORRESPONDENCE.

**BITTER ORANGES.**—In a report of the proceedings of the Scientific Committee of the Royal Horticultural Society, I observe a mention of "bitter Oranges." The subject is interesting, and M. Alphonse de Candolle, in his work on the origin of cultivated fruits, maintained a theory that all Oranges were originally bitter, and that it was probably after centuries of cultivation in its native home, which he

If growers can only have patience to delay their budding until a warmer time, the probability that the crowded shootlets and leaves will aid in saving the fruit crops is very great. I do not assert that this kind of protection will suffice against April and May frosts; but covering and enveloping them on the outer or exposed side, the foliage forms an excellent kind of protection, often proving of great use when ordinary copings, fish-nets, canvas blinds, Fir boughs, &c., without them would have failed. Plums, Pears, and Cherries, are hastening into abundant blossom, that will expand almost momentarily. Apples have withstood the allurement of the weather better than most fruit trees, the cold snap of the last few weeks having held them back, and this notwithstanding the almost summer warmth that held through April and March. Many of my readers will have noticed that Apples are the least excitable of

fruits. Of Pears, trees of *Bemré de l'Assomption*, *Glou Morecan*, *Dunmore*, *Beurré d'Amanlis*, *Pit-maston Duchess*, &c., are sheets of bloom, and Apple trees in general give promise of being sheets of rosy-pink shortly. If the frost will only keep away, bountiful crops of fruit will be harvested in due time. *H. W. W., Wilts.*

**THE WINGED ELM** (see p. 453, fig. 66).—I have often wondered that this distinct and useful *Ulmus alata* is not more generally grown. A year or two ago I saw it plentiful in the forest at Fontainebleau, and last spring I saw it often used as a shelter belt or hedge in the Scilly Islands. Here and there it is met with in Ireland, as at Carton and in co. Wicklow, where at some time it must have been planted in demesnes and woods. The soft rough two or three-year-old shoots are very pretty, and make capital pen-holders, or brush-handles for artistic uses, as they are soft to the touch, and light, and afford a firm and agreeable grip to the fingers. The "Winged Elm" is far from uncommon, and I saw a group of it in a hedgerow between St. Alhans and North Mimms the other day. This Elm is now and then confounded with *U. snberosa* or "cork-barked Elm," and it is one of the very few trees that can withstand the wind and sea-spray of the Scilly Islands and south coast. *F. W. Burbidge.*

M. LÉON SAY. (See p. 524.)

**STRAWBERRY STEVENS' WONDER.**—In your last issue (p. 496) your correspondent, Mr. Coomber, in speaking of the above variety, asks for information as to its behaviour for forcing purposes. I will gladly state my experience of it. We forced 100 this season, and it has far exceeded my expectations. It forces most easily; one great advantage, it throws its flower-trusses well above the foliage, sets its fruit well, and swells most freely. We commenced picking the first week in March. The fruit is large, somewhat ugly in shape, and for the season the flavour very good. During the summer it is a robust grower, but under glass with us the foliage produced is very small. Whatever the origin of this Strawberry, I believe it is destined to take a very prominent position for forcing. With us *Vicomtesse Héricat du Thury* does not force well; the flower-trusses never throw up sufficiently above the foliage, but they do all right as a second early. I am aware many growers depend on this as a first early, and do it remarkably well. *La Grosse Sucrée* has done wonderfully well here this season; in fact, I have never before had it so good. *Edwin Beckett, Aldenham House Gardens, Elstree.*

**BROCCOLI.**—It is seldom that we have such a season as the present one for the growth of this vegetable, there having been no frost to prevent a continuous supply being cut from the open ground since the autumn, and where a number of varieties was planted this could readily be accomplished. Broccoli, as a rule, is a very uncertain crop, and many of the varieties are not of the best quality, not being of that delicate texture and the end of a nice colour; but there are some whose heart-leaves completely cover the end, and protect it from frost and sunshine. Last autumn was not a good time for those late planted out ones, the hot dry weather in September checking growths. Those early planted were enabled to get well-rooted before the drought came, and did not suffer so much. The soil here is of a stiff nature, and Broccoli are badly clubbed in some places, even where no Brassicas have been grown for some years. Last season I planted a batch of a dozen varieties on July 3. The frequent showers during that month were just the thing to give them a start, and when the roots had fairly taken to the soil, a heavy dressing of super-phosphate of lime was afforded them, which prevented clubbing to a great extent. The best were *Veitch's self-protecting*, *Sutton's Vanguard*, *Snow White*, *Safeguard*, *Lymington*, *Veitch's Main Crop*, and *Model*, all of which are now over. *Standwell*, *Late Queen*, and *Mayflower* have not yet turned in. The last is one of the finest of late Broccolis I have grown, coming in after all of the others are over, of dwarf, compact habit, with pale green foliage, which completely covers the flower. When planted in a shady place, they will continue to give a supply till the Cauliflowers are ready for use. *H. C. Prinsep.*

refers to China, that a sweet Orange was accidentally produced; this was propagated by grafting, and the cultivation of the tree then spread westwards. The cultivation of the Orange in Europe he considered to be comparatively recent. In support of this theory, it is generally believed by gardeners, though I do not know whether it is invariably the case, that Oranges raised from a seed of a sweet Orange, produce bitter fruit, unless grafted on a sweet Orange-tree. Perhaps some one has tried the experiment, and will tell us. *C. Wolley Dod, Edge Hall, Malpas.*

**FRUIT PROSPECTS.**—We are not yet out of the wood, but seldom have our fruit prospects been brighter at the end of April. The cold at the commencement of this month has not done any harm. There have been slight frosts on the grass here and there, but none has reached so high as to have injured the fruit trees, unless it be ground cordons. Apricots, Peaches, and Nectarines have set their blossoms perfectly, and every day adds to the size and the hardness; and that in this connection is equivalent to the hardness of these fruits.

our hardy fruits. Bush fruit is almost as promising as other kinds. It would hardly be true to say that these small fruits have wintered well; for virtually we have had no winter weather, and so far but few insects have appeared to threaten our cheering fruit prospects. As to vegetables, one cannot, but note the violent contrast between 1895 and 1896. Last year hardly a Broccoli escaped the frost, and there was very little late Celery; this year hardly a plant has been lost. *Per contra*, many early Lettuces, and fully 50 per cent. of the earliest autumn-planted Cabbages, have "bolted." *D. T. P., Suffolk.*

**FRUIT PROSPECTS IN SOUTH WILTS.**—The prospect of a good all-round crop of fruit is, promising. Our Apricot, Peach, and Nectarine trees have set very heavy crops of fruit, and consequently these will require to be severely thinned forthwith. The crop of Greengage and other varieties of Plum, such as *Diamond*, *Sultan*, *The Czar*, *Belgian Purple*, *Goliath*, *Early Prolific*, and *Coe's Golden Drop*, is highly satisfactory. And the same may be averred of Pears and Apples, Cherries and small

**THE DOUGLAS FIR.**—I have sent you a few twigs of *Pseudotsuga Douglasii*, which are of some interest. You will see by specimens that male and female flowers are growing on the same tree, and in other cases there are female flowers only. Our experience here is that it is unusual to have the male and female flowers so plentiful on the same tree, indeed, very uncommon, and many of our trees are looking very

beautiful in this, their very early flowering stage. *D. Crombie, Powerscourt Gardens, Enniskerry, Ireland.* [The specimens sent were very beautiful. Our experience tallies in the main with that of our correspondent. Ed.]

**ROLLESTON HALL.**—I read with interest and pleasure your article on Rolleston Gardens which appeared in your issue of the 4th inst., but it struck me rather forcibly that in mentioning the improvements that had been effected during the last few years, no share of praise was given to the late head gardener, Mr. Albert Smith, who had charge of the gardens for five years, during which time he effected a great many improvements, including some you mentioned in your article. I do not write this in any antagonistic spirit, as I believe the present head gardener, Mr. Woodgate, is worthy of everyone's respect and good opinion, and about whose ability there is no shadow of doubt, but simply in the spirit of giving honour where honour is due, as all the local gardeners know that Mr. Smith considerably improved the gardens, both outside and under glass. *Equity.*

**HEATING GLASSHOUSES WITH STEAM.**—The application of steam to heat water-pipes in glass-houses is not new (see p. 493), for to my knowledge it has been in existence at J. Stanning, Esq.'s, Broadfield, Leyland, near Preston, for over fifteen years, and a few years ago I thought the system worth chronicling in a contemporary gardening journal, not only on account of its novelty, but that it was done without cost. Mr. Stanning's works are only a short distance from the glasshouses, and one of the waste steam-pipes from the works is conducted into the stoke-hole and connected with a cylinder in which the water is heated. The works are kept going night and day, from Monday morning until Saturday at noon, when a fire has to be lit under the boiler. The steam heater is, of course, connected with the same hot-water pipes as the boiler, and the volume of steam is regulated to a nicety by a valve in the stoke-hole, and the water circulating through the various houses may be had lukewarm or of an unbearable heat, and, of course, there is no variation in the temperature of the water as in ordinary stoking. I have noticed the thermometers attached to our Cornish boilers here fall from 5° to 15° from the time the doors have been opened for clinking and charging afresh until the fresh fuel has burnt through, or from twenty to thirty minutes, and the temperature of the water will fall rapidly after banking up, not to rise again until the fire is attended to in the morning. There is no variation with steam-heated water-pipes. If frost should set in after ten o'clock, the night-watchman has only to admit more steam. Mr. Stanning's method differs a little from that noticed at p. 493. *H. P. R.*

**THE LARCH DISEASE.**—I think your readers are entitled to ask if Mr. C. Y. Michie (p. 434) and Mr. Michie (p. 494) are one and the same? The first Mr. M. assigns the Larch disease to the Peziza, and said the disease attacked the tree, from one-year seedlings upwards, at all stages; and the second Mr. M. tells us that he could never detect the disease in one-year plants, and from the way he discusses "the producing causes" of the disease, no one would so much as guess that he had ever heard of the Peziza as one of the "causes." He lays much stress upon facts and the marshalling of them, but I detect neither the one nor the other. "It is patent to every one," he writes, "that all trees with a smooth, thin, and tender bark, are most liable to disease." I deny it, and ask him for proof. He classes the Birch, Wild Cherry, Oak, and Spanish Chestnut, as corky-barked, compared to the Larch and Ash, which, stage for stage comparatively, are nothing of the kind. There are excrescences on the older limbs of the Birch, as on other trees, but I could send you sheets of bark from limbs of all ages perfectly fine and smooth, and which at times, in the outer skin, can be stripped off like fine tissue-paper. As for the Cherry, its smooth, glossy bark is what chiefly recommends it for walking-sticks. Moreover, the Larch disease does not progress with the young limbs and young bark only, as Mr. M. states, or implies, but sometimes starts in the middle of an old tree at some wound where the corky bark has been long formed. There are one or two remarkable examples of this on some of the oldest Larches in England on one of our estates in Wensleydale, where the trees are 1200 feet above the sea, and tall for the lofty altitude. One of the worst examples of the disease in Scotland is on a small group of oldish

trees at a railway station this side of Perth, and the blister is confined almost wholly to the corky trunk. I forget the name of the station now, but the trees are very noticeable from the train. The Elm, according to Mr. Michie, is one of the corky-barked trees "singularly exempt from disease," whereas it is notorious for its fungus-eaten limbs, which drop off without notice. I have felled trees that were one mass of fungus from the bark inwards. *J. S., W.*

— If Mr. Michie's explanation of the cause of the Larch-blisters be the correct one, the American Red Larch ought to be more liable to it than the European Larch. Almost the only way in which I can distinguish the trees of Red Larch from the common ones, is by their having a much smoother bark. I have just now about 1000 seedlings of the Red Larch, and when they come to be planted out with others of the common Larch, I shall be glad to record the result in the matter of blister in the bark. *C. W. Strickland.*

**ANTHURIUMS AT SHIPLEY HALL, DERBY.**—The plants which form this fine collection are of an enormous size, and the foliage spotless, and thousands of spathes are now fully expanded. The plants are arranged on the middle stage of a span-roofed house, formerly used as a Palm-house, and they represent all of the leading varieties, including *Anthurium Wardii*, *A. sanguineum*, *A. Mundayanum*, *A. Palmeri*, &c. The Orchid-houses, fruit-houses, and kitchen gardens are in every way worthy of the highest praise. *Geo. Burrows, Berwick House, Shrewsbury.*

**PROFITABLE LAND.**—We shall hear a good deal now of the "relief of agriculture;" but does agriculture help itself all it might do? To get everything possible out of the land that can be got is what we as gardeners should aim at. But how to do it? The writer ventures to think that not enough notice is taken of the chemical manures, especially nitrate of soda, 1 cwt. of which contains as much nitrogen as 1½ ton of rich farm-yard manure. There may be in some minds a prejudice against them because they are called artificial, but if results following their use were carefully studied, and such results found good, no prejudice should stand in the way. Recently, some interesting experiments were made on Potatoes, and a member of the Ripley Agricultural Association, in growing them, applied, in addition to the dung put in the ground at the time of planting, 1½ cwt. of nitrate per acre when the Potatoes were ridged-up, and had the pleasure of lifting 5½ tons more Potatoes to the acre than he did on that part of the ground to which no nitrate had been applied. Most things, except Peas and Beans, gain much by a few applications of nitrate. Asparagus will double itself in weight, and benefit in quality. Tomatoes will increase 30 per cent.; and it is of much use to those who grow early Cabbages for the market. It can be profitably applied to Strawberries and other fruit, and a small quantity (½ oz. to the gallon) can be dissolved in the water occasionally for the plants in the greenhouse. The nitrate comes from Chili, where there are large deposits. The Continent of Europe takes a much larger quantity than the British Isles; but nevertheless, 120,000 tons are consumed here each year. Fifty or sixty years ago scarcely any use could be found for the out-turn of less than 1000 tons, and last year the total exports from Chili reached 1,300,000 tons! Mr. Arthur Robottom, of Mincing Lane, London, claims to be the first man who had to do with its use in agriculture; and Mr. Robottom, whose name is well known in connection with borax, was a few years ago in Chili, inspecting the borax land there, and incidentally the nitrate deposits. *P. D.*

## LAW NOTES.

### WILLIAMS v. VAVASOUR.

At the Clerkenwell County Court on Friday, the 17th inst., before Judge Meadows White, Q.C., Henry Williams, nurseryman, of Victoria and Paradise Nurseries, Upper Holloway (trading as B. S. Williams & Son), sued Sir William Vavasour, Bart., of 16, Vicarage Gate, South Kensington, to recover £6 10s. 3d., the price of a quantity of flower and vegetable seeds supplied to the defendant.

Mr. Charles Butcher, solicitor for the Nursery and Seed Trade Association, was for the plaintiff, and Mr. Johnson, barrister, for the defendant.

The plaintiff's case briefly was that during 1890-92 he supplied Sir W. Vavasour, who was then residing at his Yorkshire estate, Hazelwood Castle, Tadcaster, with seeds in

compliance with requirements signed by his head gardener, Walter Cornwall. Mr. Butcher contended that it was a well-recognised custom for head gardeners to sign such requisitions, liability for which was never repudiated by their masters.

Walter Cornwall said he had been head gardener to Sir William during two separate periods. He first entered defendant's service in 1887, but left in 1890. He did so of his own accord and went to work for the plaintiff, whom he had known for the past twenty years. He had been recommended to Sir William by the plaintiff. Two years after he was re-engaged by the defendant, and remained with him for about two years, after which he was discharged on the ground that Sir William was reducing his establishment. Witness had always signed orders for garden seeds, and sent plaintiff the orders, which formed the subject of the action, shortly before he left Sir William's service for the second time. He had then planted some of the seeds; the remainder would have been used all through the season had he remained. Cross-examined by Mr. Johnson: witness used to pay for the seeds which were supplied to his order, and recover the money either from Sir William or his agent. Sir William used to issue printed orders, signed by himself, for coal, coke, and flower-pots, but not for seeds, which were customarily signed by the witness. During his second engagement, he did not remember a conversation with Sir William in which the latter said the witness was never again to order seeds from the plaintiff.

Henry Williams, examined by Mr. Butcher, said that during the season, quite half of the orders received by nurserymen all over the country were signed by head gardeners. This was a well-established custom recognised by the principals. The latter rarely sent personal orders, except in the case of small estates. Witness had never received any instructions from Sir William not to supply seeds except to his written order. Had witness received such an instruction he would have entered it in his book.

Cross-examined by Mr. Johnson.—He had never received a letter dated January 27, 1887, purporting to warn the witness not to supply seeds except to Sir William's personal order. He had had some trouble with Sir William in 1892, but sued him in the County Court, and recovered the amount of his claim. This was in respect of orders which had been signed by Symes, Cornwall's successor, in 1890.

Sir Wm. Vavasour, Bart., said he now lived almost entirely in London. He had settled at Hazelwood Castle when he engaged Cornwall. He never authorised Cornwall to send orders on his account without his (witness's) signature. That was a liberty he never allowed even his agent to take, as being a business man he knew the value of being methodical; moreover, his orders on the subject were well known to everybody about the place. When Cornwall returned to his employment after he, Sir W. Vavasour, had been sued by Williams, he asked witness if he should get seeds from the plaintiff, and witness said, "Certainly not, after the way in which they have treated me." He never knew that Symes had issued orders for seeds. It was the price of those seeds which formed the subject of the former action. This he would have defended, but for the fact that his affairs at that time were not in his own hands.

Mr. Johnson argued that there was no such custom as that for which the plaintiff contended, viz., that head gardeners may issue orders on behalf of their employers. The question here was one merely of evidence, and not of custom. Where, as in this case, a servant got specific instructions from his master not to get goods on credit, he had no right to do so, and those who dealt with him did so at their own risk; were it otherwise, there would be no limit to the number of actions which might be brought against masters.

Mr. Butcher contended that as Cornwall had originally asked the defendant whether he could have seeds from plaintiff, and defendant had consented and sent the order to him without any directions not to execute orders sent by his gardeners, except upon his written authority, and as numerous previous orders had been sent by the gardeners and executed, and defendant had paid for the same, it was not sufficient for him to forbid Cornwall sending further orders to plaintiff, but that he should have given plaintiff notice not to execute further orders sent by his gardeners; and the defendant was bound by the orders given by his servants within the scope of their employment.

His Honour, while agreeing that this was a question of evidence and not of custom, was of opinion that the plaintiff was entitled to recover on the ground that the long course of dealing between the parties showed that, in respect of garden seeds, the head-gardener had authority to send to the plaintiff for them. He thought the plaintiff was justified in considering that defendant's gardener was the person who, from time to time, indicated what seeds were wanted, and who was deputed by the defendant to order them. His Honour accordingly gave judgment for the amount claimed, with costs.

## TRADE NOTICE.

MR. WILLIAM TODD, for 19 years in the service of the firm of W. Tait & Co., Seedsmen, Capel Street, Dublin, now R. Simpson, has severed his connection with that firm, and become general manager of the old-established firm of Sir JAMES WM. MACKAY (Ltd.), 23, Upper Sackville Street, Dublin.

## SOCIETIES.

## ROYAL HORTICULTURAL.

APRIL 21.—The meeting on Tuesday last, held in the Drill Hall in James Street, Westminster, was an unusually good one. Part of the success of the meeting was due to the holding in connection therewith, of the annual Southern exhibition of the National Auricula and Primula Society, the display of Auriculas being generally satisfactory to the experts. This circumstance was no doubt responsible in some measure also for the exceptional attendance, which during the afternoon quite thronged the Hall. That the usual type of exhibits were by no means few will be seen from the subjoined report. Orchids were numerous, Roses were exhibited in large quantities, and were of surprising excellence. Novelties in plants of various kinds were awarded as many as twelve Certificates and Awards of Merit combined. Spring flowering shrubs, others with ornamental foliage, and hardy plants generally are now becoming more general, but on the other hand Daffodils are passing out of flower, and this is probably the last occasion for the season that a tolerable display of such flowers will be made. Exhibits of Fruit were few, but there were some good vegetables. The presentation to Mr. Barron, alluded to in our leader, was made at the Windsor Hotel, Mr. Burlidge, Mr. Wynne, and a number of Mr. Barron's old pupils were present, together with a large gathering of friends.

## Floral Committee.

Present: W. Marshall, Esq., in the Chair; and Messrs. H. B. May, H. Herlitz, J. H. Fitt, Geo. Stevens, John Jennings, Jas. Hudson, J. F. McLeod, Thos. Peed, J. D. Pawie, Chas. E. Shea, H. J. Jones, Ed. Beckett, Robt. Owen, Geo. Paul, H. S. Leonard, Jno. Fraser, R. M. Hogg, J. Fraser, Geo. Nicholson, Chas. Jeffries, and Jas. Walker.

Messrs. PAUL & SON, The "Old" Nurseries, Cheshunt, staged a bright collection of hardy plants and sprays from hardy flowering shrubs. Among the former were *Doronicum australe*, several good varieties of *Caltha* as *C. monstroza plena*, *C. pilustris plena*, a perfectly variegated *Strawberry* (*Fragaria variegata*), a purple foliaged *Astilbe* (*Spiraea reticulata purpurea*), *Gentiana acaulis*, *Pulmonaria arvensis*, a comparatively new species, growing ten inches high and bearing deep blue flowers, and other things. Amongst the shrubs represented were the different varieties of *Ribes*, including the very fine *Ribes sanguineum* and *R. hybridum*, several varieties of *Lilacs*, and a fine lot of the cream flowered *Genista pinnatifida*. Several very pretty standards of the latter were shown, and a golden form of *Juniperus communis*, named *aurum*, which was awarded a 1st class certificate.

*Cheiranthus* var. *Harpur Crewe* (also exhibited by Mr. Wm. Marshall), is also a dwarf growing very erect variety, with small glaucous green foliage and double flowers of golden yellow colour. The inflorescence is more densely flowered than the ordinary wallflower (Award of Merit). A similar award was recommended to *Myosotis Kehstneri*, an exceedingly dwarf species, with small pale blue flowers. A Silver Flora Medal was awarded this group.

A collection of hardy flowers was exhibited by the DUKE OF RUTLAND, Belvoir Castle, Grantham (gr., Mr. W. H. Divers). Most of the plants represented were seen in fresh good specimens—*Berberis Darwinii*, *Spiraea Thunbergii*, *Kerria japonica*, *Amelanchier vulgaris*, an excellent variety of *Rhododendron campanulatum*, *Amelanchier botryoides* (rose coloured), *Lonicera fragrantissima*, a very fragrant and early flowered plant, *Azara microphylla*, a vanilla-scented plant with inconspicuous yellow flowers, *Camellia corallina*, *Spiraea prunifolia*, fl. pl., a few varieties of *Iris*, *Magnolia*, *Pieris*, &c., were noticed (Bronze Banksian Medal).

In addition to a fine collection of Daffodils, Messrs. BARR & SON, King Street, Covent Garden, W.C., exhibited flowers of a number of varieties of *Tulips*, also plants in flower of *Sanguinaria multipetala*, and the prettier and finer *S. canadensis* major, with large white flesh-tinted flowers in which the decidedly yellow anthers are very effective. Several varieties of *Saxifraga* and *Androsace* were shown, also the pretty violet blue flowered *Phlox divaricata*, and *Iris pumila* var. *Count Androssy*, *I. Olbiensis*, sulphurea *grandiflora*, the compact habited *Tiaretta cordifolia*, and other things (Bronze Banksian Medal).

A miscellaneous exhibit from Messrs. J. CHEAL & SONS, Lowfield Nurseries, near Crawley, contained sprays of many species and varieties of hardy flowering or ornamental foliage shrubs, sprays of *Viola* flowers, and a few coloured *Polyanthus* plants in flower. Among the first-named were noticed several good varieties of *Cerasus*, also *Berberis aquifolia*, *Philadelphus coronarius aureus*, *Pyrus malus-floribunda*, *Pyrus Halleana hort.*, *Amelanchier botryapum*, *Genista scoparia*, *Akebia quinata*, &c. (Silver Banksian Medal).

An excellent group of hardy plants was exhibited on the floor of the hall by Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham. *Primula Sieboldi* in a variety of shades, and grown in pans, were very fine, a variety known as *P. S. Halicna marginata*, being especially delicate. Several varieties of *Iris pumila* were exhibited, also the white-flowered *Saxifraga Composita*, the white-flowered *Dielytra* (*D. spectata*

*alba*), several hardy Orchids, a number of Daffodils, *Fritillarias*, and other pretty things (Silver Flora Medal).

A group of double-flowered Ghent Azaleas was the exhibit of Messrs. Wm. Curcush & Son, Nurserymen, Highgate, London, N. Each of the following varieties were represented by a number of plants containing plenty of flowers. *Graf von Meran*, Major, Raphael de Smet, suffused rose in greater or less degree, *Arctusa*, *Chromatella* and *Ophirio arpa* pale yellow or cream-coloured, and *Dector Streiter* is a good decided yellow (Silver Banksian Medal).

A group of interesting plants was exhibited by Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, Chelsea. The following are some of the plants contained in this collection, *Epiphyllum Russellianum Gaertneri*, one of the very best of the *Epiphyllums* was represented by a few well flowered plants. A very ornamental *Tillandsia* (*T. Zahnii*), with leaves about two feet long, very prettily lined with red on the under surface. *T. Lindenii* tricolor, a variety with green leaves producing many showy flowers of purple-blue, and white, the bracts being pale flesh coloured. A fine group of *Spiraea astilboides*, *Anturium Scherzerianum atropurpureum*, with many flowers, the fine yellow flowered *Calla* with variegated foliage (*Richardia Elliottiana*). A perfectly variegated *Hydrangea hortensis* in flower, *Spiraea opulifolia aurea*, *Hydrangea japonica rosea*, a variety with pretty flowers decidedly rose-coloured, distinct and very noteworthy. *Wistaria sinensis* flowering in pots, and profusely flowered sprays of *Prunus pseudo-cerasus* (Waterer's variety). The last named plant, which bears large semi-double rose and white coloured flowers, was recommended an Award of Merit. A similar Award was recommended to a very pretty *Rhododendron* described as perfectly hardy (*R. Schlippenbachii*). The leaves as shown are small and bronzy green like those of *Azalea mollis*. The flowers are funnel-shaped, pale rose coloured, with a few small spots at the base of the upper segments; the plant was figured in *Gardeners' Chronicle*, April 14, 1894, p. 469. An Award of Merit was recommended to *Maranta major*, a plant about 3½ feet high, with very long petioles and pretty leaves of various shades of green. Messrs. JAS. VEITCH & SONS also exhibited a group of the blue-flowered *Primulas* with abundance of flowers (Silver-Gilt Flora Medal).

A group of choice Ferns came from the establishment of Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, London, N. One of the prettiest of these was *Pteris serrulata gracilis*, a most graceful form of the well-known *P. serrulata*, *Pteris cretica* *Wimsettii*, *Pteris bauriana argentea*, and *Pteris tremula elegans*, a narrow fronded variety, heavily crested, and others are very good. *Adiantum Earleyense* and several other varieties of *Adiantum* with tinted fronds were included, and in addition were exhibited a few plants of *Spiraea astilboides floribunda*, and a group of the new golden yellow *Tropeolum* (*T. Coolgardie*), a distinct and exceedingly effective plant (Silver Flora Medal).

Messrs. JNO. PRED & SONS, Rompell Park Nurseries, Norwood Road, London, S.E., were again represented by a bright group of miscellaneous flowering and ornamental foliage plants. This group contained some good *Cleives* and a plant in bloom of *Azalea mollis* var. *Anthony Koster*, a very fine large flowered yellow variety, figured in *Gardeners' Chronicle*, April 29, 1893, p. 513 (Silver Banksian Medal).

*Gloxinias* were exhibited tastefully amid Ferns by Messrs. JEO. LANG & SONS, Forest Hill Nurseries, London, S.E.

For so early a date the display was very fine, the flowers being large and of very bright colours (Silver Flora Medal).

An Award of Merit was recommended to *Anthurium Rothschildianum elegans*, shown by Sir TREVOR LAWRENCE, Bart. (gr., Mr. Bain). The spathe vary a little in shape, and the mottling is very pretty.

A Silver Banksian Medal was recommended Mr. F. W. MOORE, Botanic Gardens, Glasnevin, for a small collection of sprays of flowering or ornamental shrubs, &c. These included *Pyrus spectabilis rosea*, *Prunus* (*Padus*) *cornuta*, *Acer pseudo-Platanus roseo-variegata*, *Cytisus biflorus*, described as being hardy at Glasnevin, *Paeonia cretica*, &c.

The Hon. F. D. SMITH, Greenlands, Henley-on-Thames (gr., Mr. Perkins), exhibited two very fine seedling varieties of *Hippastrum*. The better of these (Viscountess Hambledon) was recommended an Award of Merit. The large, bold flowers were very bright scarlet, with green and white throat.

Mr. CHAS. TURNER, Royal Nurseries, Slough, was recommended an Award of Merit for a self-coloured, yellow Carnation named *Countess Carrington*, apparently a very desirable variety. Mr. TURNER also exhibited a group of *Primula Sieboldi* in variety, for which he was awarded a Silver Flora Medal.

An Award of Merit was recommended to a very large, double-flowered *Cineraria* (for strain), with remarkably small foliage. The colour of the flowers violet rose, and they are exceedingly large in size. The plant was exhibited by Sir HENRY Peto, Bart., Chedington Gardens, Crewkerne, who had grown it from seeds supplied by Messrs. SUTTON & SONS, Reading.

Messrs. J. SILVER & Co obtained an Award of Merit for *Primula* Dr. Jamieson, a form of *P. viscosa* (?), but as the plants were taken from the Hall before the usual time, we are unable to describe it.

Mr. FRANK CANT, Braiswick, Colchester, exhibited cut Roses, in four boxes, of twenty-four blooms each. Some of these flowers were uncommonly good, whilst others were deficient in size and finish. Fine blooms were shown of *Baroness Rothschild*, *Heinrich Schultzeiss*, *Madame G. Paul*, *Ernest Metz*, *Ulrich Brunner*, *Duke of Edinburgh*, *Caroline Testout*, *Madame Buis*, *Comtesse de Nadaillec*, *Mrs. John Lang*, and *Madame Hoste*. These and some other varieties

were found in duplicate in all of the boxes (Silver Flora Medal).

Mr. G. MOUNT, Rose Nurseries, Canterbury, exhibited a large collection of Roses (cut) in boxes in good quality, exceeding in most instances those of Mr. F. Cant. Some of the finest were *The Bride*, *Catherine Mermet*, *Innocente Pirola*, *Ulrich Brunner*, *Madame Montet*, *Baroness Rothschild extra fine* (a boxful of flowers), *General Jacquemont*, *Souvenir d'un Ami*, *La France* (a boxful of superb flowers), *Niphetos*, &c. (Gold Flora Medal).

Messrs. WALLACE & Co., Colchester, showed *Erythronium Johnsoni*, a new species of dwarf stature, with the usual spotted foliage, and a scape 5 inches in height; the colour is of a bright rose pink. There were also shown *E. Smithi* with white flowers; *E. giganteum* with yellow ones, fading off to white at the tips of segments.

Messrs. B. S. WILLIAMS & SON, Paradise and Victoria Nurseries, Holloway, N., exhibited a number of *Hippastrum* varieties in pots, mostly of shades of crimson, scarlet, and striped with white or green. The segments of the flowers of this type are rather narrow, and pointed, but one called *Hon. Maurice Gifford*, a crimson self, was of different form, the segments being broader and more reflexed; it received an Award of Merit. *Leviathan*, *Mrs. Nottage*, *W. Young*, *Emperor Frederick*, *President Harrison*, were notable varieties. The firm showed *Moutan* Peonies in pots, viz. *Cardinal Antonelli*, pale flesh colour, and double; *P. M. maxima plena* of a deep rose tint and fragrant; *P. M. La Ville de St. Denis*, of a light mauve colour, and very double; *P. M. Madame Stuart Low*, cherry red. A Gold Banksian Medal was awarded for the entire group.

The GUILDFORD HARDY PLANT NURSERIES, Millmead, Guildford, showed an unique specimen, ten years grown in a pot of *Trillium grandiflorum* which formed a mass two-and-half feet in diameter of white blossoms and healthy foliage, an admirable plant, showing what the species is capable of (Cultural Commendation). From the same place came a sloping bank of Alpines, tastefully arranged. We remarked neat masses of *Epimedium niveum*, *Polygala Chamæboxus purpurea*; *P. C.* the type, with yellow, white, and crimson flowers; a Daisy with single flowers, the rays crimson and disc yellow—it was very showy for so small a flower; *Cyclamen repandum*; a pigmy Conifer, *Juniperus hibernicus compressus nanus*; *Armeria caespitosa*, *Gentiana* in variety; *Erica Foxii*, *S. Valdensis*, and *S. Aizoon*, *Primula ciliata* var. *Balfouriana*, a plant of very dwarf habit, with deep purplish-red flowers; and *P. Scandneri*. The whole collection as arranged had a good effect. A Silver Flora Medal was awarded.

Mr. J. WALKER, Nurseries, Thame, Oxon, showed a large quantity of cut Roses, one box being filled with flowers in bunches of *Duchesne de Caylus*, *Perle des Jardins*, *Devoniensis*, *Souvenir d'un Ami*, *W. A. Richardson*, *Lamarque*, *Souvenir de la Malmaison*, all excellent at that stage as button-hole flowers. Three show-boxes were filled with a fine even lot of bloom of *Marchal Niel* Roses, and one with excellent blooms of *Niphetos* (Silver Flora Medal).

Messrs. DOBBIE & Co., Rothsay, showed a new *Wallflower*, *Eastern Queen*—faded-looking blooms, in buff, pale yellow and pinkish-brown.

## Narcissus Committee.

Present: J. T. BONNETT-POE, Esq., chairman; C. R. SCRABE-DICKENS, Esq., secretary; Miss Willmott, Rev. G. H. ENGLEHEART, Messrs. A. Kingsmill, J. Walker, P. Barr, P. R. Barr, C. Cowan, F. W. Burlidge, and others.

The Auricula festival has usually found Narcissi in full tide, and an imposing display of their flowers, but on the present occasion the exhibits were neither many nor large—so much so that the Silver Cup and other prizes offered by the Society were not competed for. The probable explanation of this shortcoming is the extreme earliness of the Narcissus season in the southern counties. Even by April 7, the Trumpet Daffodils were waning, and it was difficult for amateur growers to find sufficient variety for a stand of some forty or fifty varieties.

Messrs. BARR & SON occupied their customary quarters in the hall, with a handsome bank of all available kinds, of which, however, the later sections of short-crowned flowers and the several kinds of *N. poeticus* in cultivation made up the chief part. Amongst these such fine flowers as *Crown Prince*, *D. E. Wemyss*, and *Gloria Mundi*, of the *N. incomparabilis*, and the bright-crowned *N. poeticus poetarum* were distinct features of merit.

The Rev. G. H. ENGLEHEART had a small stand, which drew much attention throughout the day, of his new hybrids and seedlings. A very striking flower named *Mars*, with broad, beautifully-shaped divisions of soft yellow, and a widely-expanded shallow crown of brilliant flame colour, won the prize for the best seedling of the day. *Spitfire*, with narrow petals of brighter yellow and orange-scarlet crown, is quite distinct and valuable as a late kind, as are some others shown with vividly-coloured cups. Most of this stand was filled with new varieties of *N. poeticus*, selections from the new and greatly-improved strains which Mr. ENGLEHEART has obtained by intercrossing such kinds as *N. p. ornatus*, *poetarum*, and *recurvus*. The last-mentioned sort, crossed with the much earlier *ornatus*, has yielded large and so-called-petalled flowers, intermediate in form and date of blooming, while many of the seedlings exhibited had the red eye of *poetarum*, broader and intensified in colour, together with largely-increased size, and the round outline of *ornatus*. Of these *Horace*, *Coelus*, *Sonnet*, *Carmen* were very noticeable. Mr. ENGLEHEART's exhibit gained the 1st prize and a Silver Banksian Medal.

## Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. Geo. Bunyard, Jos. Cheal, H. J. Pearson, A. H. Pearson, Wm. Pope, A. F. Barron, T. H. Crisp, J. Wright, Alex. Dean, S. T. Miles, Jno. A. Laing, J. Willard, W. Farr, Chas. Herrin, G. H. Sage, H. Balderson, Robt. Fife, F. Q. Lane, J. Smith, G. Norman, and W. H. Divers.

A very fine collection of vegetables was exhibited by Mr. Empson, gr. to Mrs. WINGFIELD, Amphill. Veitch's Model and Chelsea Favorite Broccoli, The Lyon, and Prizetaker Leeks, and Ellam's Early Cabbage, Rochford's Market, and All-the-Year-Round Cucumbers, French Beans, Sharpe's Victor Potato, and Connover's Colossal Asparagus, were some of the dishes represented by first quality exhibits (Silver Banksian Medal).

From Mr. Jno. Crook, gr. to W. H. EVANS, Esq., Forde Abbey, Chard, was exhibited a dish of Onions (Forde Long Keeper) from seeds sown in the Autumn of 1894. The bulbs were perfectly sound; also a dish of Apple Sturmer Pippin which had been stored in cases for six months.

Radishes White and deep Scarlet Olive-shaped extra early, exhibited by Messrs. VILMORIN & Co., Paris, France, were each recommended an Award of Merit. They had been grown at Chiswick from seeds sown in cold frames on March 5th last.

Mr. T. MARSH, Priory Nursery, Warwick, showed Apple Countess Warwick.

A collection of Apples was shown by A. W. WRIGHT, Esq., Halstree Gardens, Whittington (gr., C. Roberts). The fruits consisted of Lanc's Prince Albert, Seedling Crab (three dishes), Gooseberry Pippin, French Crab, Bramley Seedling, and Norfolk Beauty. Most of these were in a state of good preservation, and were the produce of heavily-cropped standard trees.

THE FRENCH FLINT GLASS BOTTLE CO., G. V. De Luca, Hill & Co., 6 & 7 Long Lane, Aldersgate St., London, E. C., showed bottles of Cherries, Strawberries, Damsons, Pineapples, Cauliflowers, Peas, French Bean, Asparagus, Tomatoes as sauce, Honey, Milk, Soups, Carrots, &c.

These were preserved by the process of boiling in a Bain Marie in bottles fitted with a patent cap of tinned steel and a thin indiarubber ring. The bottles are specially made, and the metal covers are kept in position by simple steel clips during the process of cooking, the pressure of the outer air fixing the caps on securely on the contents cooling. The sweets, &c., preserved in bottles are prepared in a cold chamber. The whole process is cleanly and cheap, and the goods shown were of excellent quality. There is nothing but what any person, with a few simple instructions which the company supply with the bottles and caps, can carry out. It is likely, for household use, to supersede the unsatisfactory and troublesome parchment covers, and corks, and caling-wax, &c. A Silver Banksian Medal was awarded.

EARL FENBY, Syon House, Brentford (gr., Mr. Geo. Wythes), exhibited a very commendable collection of early spring vegetables, and a few choice varieties of Broccoli, viz., Late Gem, Leamington, Miller's Late Dwarf, Cattell's Eclipse, Veitch's Model, and Sutton's Bouquet, the last-named being an exceptionally small-flowered variety. Of other vegetables we noticed Early Offenham Cabbage, Connover's Colossal, and Battersea Giant Asparagus, Syon House Cucumbers, Sharpe's Victor, and Wythe's Seedling Potatoes, Lauder's Broadleaf Spinach, Purple Seakale, Early Milan Turnips, French Beans, and Mushrooms. A few bunches of ripe Grapes from Vines in pots were shown, and some very fine Royal Sovereign Strawberries (Silver Banksian Medal).

## Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. J. O'Brien (Hon. Sec.), S. Courtauld, J. Douglas, W. Cobb, E. Hill, Chas. Winn, W. H. Protheroe, H. J. Chapman, W. H. White, H. Ballantine, J. Gabriel, F. Hardy, T. Statter, H. M. Pollett, and De B. Crawshaw.

Although the exhibits were not so numerous as at the last three meetings, still a very fine show of Orchids was staged, and in the allotment of spaces Mr. WRIGHT, the Superintendent, did all that was possible to further the general effect.

Sir TREVOR LAWRENCE, Bart., Burford, Dorset (gr. Mr. W. H. White), showed a pretty and interesting group of rare plants, some of which have been but seldom exhibited at previous meetings. Of these, the singular Dendrobium cymbidioides, whose growth somewhat resembled that of *Maxillaria picta*, bore several upright spikes of cream-white flowers with a few purple markings at the base of the lip. One spike bore nine flowers loosely and prettily arranged. Other species were *Cymbidium tigrinum*, a dwarf plant with large flowers having greenish sepals and petals and white lip spotted with purple. A fine plant was shown which received a Cultural Commendation, and the same Award was given for a charming plant of *Dendrobium capillipes* well furnished with pretty yellow flowers; and the small white flowered *Sarcophilus Hartmanni* received a Botanical Certificate. In the group were five plants of *Masdevallia* × *Caudato-Estrada*, M. Armini and M. caudata and M. C. Shuttleworthi, covered with flowers; the richly coloured *Odontoglossum triumphans nigratum*, a fine plant of the delicate white, rose, and yellow, *Dendrobium crepidulum labelliglabro*; a cushion-like mass of the pretty white *Polystachya Ottobiana*, with over one hundred flowers; the graceful *Eria zerdostachya*, a tall, graceful plant with racemes of flowers. *Epidendrum arachnoides* (Botanical Certificate). *Cochlidia Noezliana*; the handsome *Cypripedium* × *Chas. Rich-*

man and C. × Wilton-house hybrid; the fine yellow and purple *Maxillaria prestantis*.

Among hybrids were *Dendrobium* × *Wigania* (signatum ♀ noble ♂) which was first raised in Sir F. WIGAN'S garden, and shown by his grower, Mr. W. H. Young, but the plant being then immature, no award was made. Since that time, plants have flourished with Sir TREVOR LAWRENCE and Messrs. J. VEITCH & SONS. The flowers of this cross vary from yellowish white with a narrow coloured eye to white tinged with rose, and with dark purple and yellow base to the lip. The plants exhibited on this occasion received an Award of Merit. When in course of time Lady Wigan's *Dendrobium* becomes mature it will become a favourite with many people. A Silver Banksian Medal was awarded for the group.

A Silver Flora Medal was awarded to Messrs. J. VEITCH & SONS, Chelsea, for a charming group in which the varieties of the delicately tinted and fragrant *Cattleya Schroderae* were remarkable. One very distinct white form, C. S. aurea, with an orange-coloured blotch on the lip; and C. S. eximia had a glowing dark rose coloured lip with under-tint of orange lighting up the centre, were the more striking varieties. The latter received an Award of Merit. *Epidendrum* × *Androsia-Wallisii superbum* in point of beauty excels the original in the rich purple violet and clear white of its flowers. It secured a First Class Certificate. Other remarkable plants were the above-mentioned *Dendrobium* × *Wigania* (Award of Merit), *Cypripedium* × *Druryi-Hookeri*, wax-like in substance and singular in colour; *Angrecum metallicum* (Botanical Certificate) with small roundish leaves, and pendent sprays of white flowers with curved and slender spurs; the pretty pink *Disa* × *Laegleyensis*; *Laelio-Cattleya* × *Pallas*; *Laelia* × *Latona*, *Cymbidium* × *eburneo-Lowianum*, some fine *Cattleya Lawrenceana*; *Cirrhopetalum picturatum*; *Maxillaria Sanderiana*, *Dendrobium veratrilium*, varieties of *Laelia purpurata*; *Laelia Boothiana*, *Cypripedium caudatum*, and other *Cypripediums*, *Odontoglossums*, *Oncidiums*, &c.

R. BROOMAN-WHITE, Esq., Ardarauch, Garrothead, N.B. (gr., Mr. Roberts), was awarded a Silver Banksian Medal for flower spikes of his fine strain of *Odontoglossum crispum*, and many remarkable and handsome forms of *O. Andersonianum* type, of which there was a bewildering collection. Three of the more distinct ones received an Award of Merit—viz., *O. crispum*, Ardarauch variety, a heavily blotched flower of the *O. c. apiatum* class; *O. × Andersonianum candidum*, a milk-white form, with spots nearer to those of *O. crispum* in shape than usual; and *O. Andersonianum*, Ardarauch variety, a beautiful flower, in colour creamy white, its entire surface covered with small red-brown spots.

Messrs. F. SANDER & Co., St. Albans, staged a good group of the chief showy Orchids of the season, and among which were varieties of *Cattleya Schroderae*, C. Mossiae, and C. citrina, the pretty *Dendrobium O'Brienianum striatum*, *Colognye Dayana*, *Spathoglottis Lobbi*, *Epidendrum Wallisii*, fine varieties of *Oncidium varicosum* and *Lycaste Skinneri*; five forms of *Odontoglossum crispum*, *O. Pescatorei* and *Miltonia vexillaria*, *Cypripedium hirsutissimum*, *Brassia Lewisii*, and a singular little *Phalaenopsis*, said to be new, with yellowish flowers barred with brown, and round front lobe to the lip (Vote of Thanks).

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr., Mr. Aldous), staged a very effective group of *Odontoglossums* and other showy Orchids, among which were noted the rose-purple *Vanda Parishii*, *Marriottiana* (Award of Merit), *Miltonia vexillaria*, and *M. Phalaenopsis*, *Epidendrum Wallisii*, *Laelia cinnabarina*, and some forms of *Odontoglossums*, &c. (Silver Banksian Medal).

WELBORN S. ELLIS, Esq., Hazelbourne, Dorking (gr., Mr. Masterton), showed a number of *Odontoglossum crispum* in variety, and other *Odontoglossums* in variety, among which were a massive branched spike of the Hazelbourne variety of *O. Pescatorei*; a noble dark variety of *O. triumphans*, and *Dendrobium Hildebrandi* in better form than it has been hitherto observed (Silver Banksian Medal).

Messrs. HUGH LOW & Co., Clapton, staged a group of Orchids, consisting of *Cattleya Schilleriana* C. Lawrenceana (C. L. grandis being a very fine and richly coloured variety); C. Mossiae, many varieties of *Odontoglossum luteo-purpureum* and other *Odontoglossums*, including the remarkable *O. × stelliticum* (Pescatorei × Lindleyanum); *Cypripedium* × *Masonii* (Stouli × *Speierianum*), *Dendrobium nobilissimum*, *D. Phalaenopsis Schroderianum*; *Laelia purpurata*, *Oncidium phymatocidium*, &c. (Vote of Thanks).

Mr. R. GULZOW, The Melbourne Nurseries, Bexley Heath, showed a tastefully arranged group of *Laelia purpurata*, with two very pretty *Cattleya Trianae*, C. intermedia, and fine varieties of *Oncidium Marshallianum* (Vote of Thanks).

G. W. LAW-SCHOFFIELD, Esq., New-Hall-Hey, Rawtenstall, sent *Cypripedium* × *Scheffeldianum* (*heliatum* × *hirsutissimum*), a very fine flower, partaking much of the characteristics and markings of C. *heliatum*. Its massive flower was cream-white, the petals having distinct uniform purple spots; the dorsal sepal a green centre and some fine radiating purple-dotted lines, and lip of rose-purple (Award of Merit).

MALCOLM S. COOKE, Esq., showed a group in which the central plant was a fine *Cymbidium Lowianum*, and some good *Odontoglossums*, &c. (Vote of Thanks).

C. J. LUCAS, Esq., Warnham Court, Horsham (gr., Mr. Duncan), sent two very pretty varieties of *Odontoglossum* × *excellens*; *O. Halli Lucianum*, with the sepals and petals almost wholly coloured brown; *O. crispum* "Dolly," a bluish white variety, with minute brown spots, &c.

DE B. CRAWSHAW, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed a fine form of *Odontoglossum lanceans*

*braicium*, Reich.f., and one of the best formed and marked varieties of *O. Andersonianum* named Rosefield variety.

Mr. JAS. DODOLAS, Gt. Bookham, Surrey, sent a fine *Platanus* × *Cooksoni*.

F. M. BURTON, Esq., Highfield, Gainsborough, showed *Cypripedium* × *Highfieldense* (Druryi ♂, Lawrenceanum ♀) in which the male parent was not evident.

J. BRADSHAW, Esq., The Grange, Southgate, N. (gr., Mr. Whiffen), showed *Cattleya Mossiae Whiffeni* like a pale C. M. aurantiaca.

W. G. SEDGER, Esq., Wilton Road, Wimbledon, showed the pretty and graceful white *Dendrobium lingueforme* from Australia.

Mrs. BRIGGS, Bury Bank House, Accrington, sent a good variety of *Dendrobium Darwinianum*; and F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent *Dendrobium barbatulum* and *D. caniferum*, the latter receiving Botanical Certificates.

## Lecture on Pineapples.

In the absence of Mr. H. W. WARD, of Longford Castle Gardens, Salisbury, a paper contributed by him on the Cultivation of the Pineapple was read by the Assistant Secretary.

Mr. WARD, whose success in the culture of these fruits is well known, commenced his paper by remarking that the Pineapple is a native of the West Indies, and that it is grown very largely in Jamaica, and other West Indian Islands. The mean temperature of these Islands is generally about 80 degrees. The plant was introduced to Britain in 1690, since which time it has been cultivated for its fruit, more or less, in English gardens. In reference to the tendency during late years to cease the cultivation of Pineapples in England owing to the expense connected with their culture, and to the fact that imported fruits can be easily obtained, the lecturer declared that the heavy expense necessarily incurred was more imaginary than real, was indeed contrary to facts. Also that the superiority in quality of British-grown fruits over any imported ones, was very considerable. No garden was complete without a Piney. To obtain success it was necessary that there should be proper accommodation, and that the grower should have a thorough knowledge of the plant's requirements. Given these, Pineapples could be grown with less trouble than any other fruit. Detailed information was then given as to the particular kind of houses preferred by Mr. Ward. In all cases the houses should be low, that when plunged the plants may be but little removed from the roof glass. A sufficient quantity of 4-inch pipes should be employed, that the necessary temperature may be maintained without unduly heating the apparatus; and the same care should be taken in regard to bottom-heat, that the material in which the plants are plunged shall be equable and sufficiently warm. During the colder portions of the year less expense from firing will be incurred if the plants are cultivated in a lean-to house, as there will be a surface of less extent exposed to the weather than would be the case in a span-roofed building. In such a house there should be one raised bed which need be only 3 ft. from the roof-glass. The house might run from E. to W., and the roof be given an angle of 34°. In span-roofed structures suitable for the cultivation of Pineapples during the summer months there should be one centre bed, and this surrounded by a path, separating centre bed from those at the sides. In both houses it should be possible to ventilate from the roof and side. Though Pines are cultivated with considerable success in old houses not specially suited to the plants, the grower in such cases was disadvantageously circumstanced as compared with the grower possessing a house of the modern type.

The lecturer emphasised the importance of obtaining clean stocky plants to commence with. Having got suckers of such a character the jagged ends should be cut off, and some of the older and bruised leaves removed so that the roots ready to push from their base might suffer no hindrance. The suckers should be potted up in sizes. If this operation be done in April, care should be taken to warm the soil thoroughly before it is used. Good drainage and absolutely clean pots must be used. Pot the largest suckers first, and plunge them in the same order, the top of the foliage being only a few inches from the roof glass. The soil should be rammed well and the sucker made perfectly firm. As soon as there are plenty of roots formed, the plants may be given liquid manure occasionally, also surface dressings with some reliable stimulating manure. This treatment can be continued until the fruits are well up. The plants must not be allowed to become pot-bound before they are transferred to those in which they are to fruit. For this operation, as favourable weather should be chosen as possible. Afterwards shade the plants from strong sun light for about three weeks, and then gradually lessen same, also increase daily the circulation of air in the house, when the temperature is from 80° to 90°. The bottom heat should be kept at about 85° during summer and autumn. In winter the fruiting Pines should be given a day temperature of 70° to 75°, or by sun heat 80° to 85°. The fruits should be made secure by ties. That the crowns may not become unproportionately large, care should be taken that no water is allowed to lodge in them. On the other hand, if the crown in any case appears to be unproportionally small, a little tepid water occasionally will be likely to induce growth in same.

As Queens are prone to produce numerous suckers, it is important that no water be allowed to rest in the axils of the leaves, but in varieties of an opposite character this would

not signify. The ripening of the fruits might be retarded a month, if, when colouring commences the plants be removed to an airyinery from which the grapes have been cut. The plant should be placed on an inverted pot in such cases as a guard against mice. The colour and flavour of fruits so treated will be superior rather than inferior to those not so treated.

The principal insects from which the Pine is liable to attack are scale and mealy-bug. Black scale can be got rid of with comparative ease, but Mr. WARD'S experience with white scale that obtained a footing owing to the introduction of suckers from another source was that, plants attacked with such pest were best thrown away, and a fresh start should be made. The lecturer had had no experience with mealy-bug, but he believed that this also was very troublesome if it once obtained a footing.

Mr. J. H. FISHER, who occupied the Chair, said that the decadence in Pine-culture in England was no doubt due to the abundance of excellent fruits of fine flavour that could now be obtained from the Canary Isles. He had bought splendid fruits from 5 to 7 lb. in weight at 2s. 6d. each. Undoubtedly, fruits produced in Britain, under such careful treatment as was described in the lecture, were superior in flavour and colour to any produced in the best condition out of doors in their native habitats. But the difference to an ordinary individual was hardly perceptible and was certainly not worth the difference in cost. The chairman also described the popularity of the fruit in Singapore, and remarked that it was the custom there to eat salt instead of sugar with them. Mr. FISHER believed that if his audience were to give salt a few trials they would prefer it, and it was certainly more wholesome. Perhaps it was not generally known that the bottom part of a Pineapple was decidedly better than the top. If any person was able to choose, however, he would recommend him to take a slice from the lower half.

## BRIGHTON AND SUSSEX HORTICULTURAL.

APRIL 14, 15.—Taken all round, the above was a very pretty show, and if we did not see any remarkable exhibits, it had the merit of containing few, if any, bad ones.

Messrs. BARR & SOSS' Daffodils were grand, as were also the miscellaneous subjects from Messrs. CUTRESH & SOSS nurserymen, Highgate, N.

Messrs. W. BALCHIN & SOSS, Brighton and Hassocks, again had a splendid stand of Azaleas, Boronias, Acacias, Anthuriums, Lilioms, &c., which made one of the grandest displays in the show.

For a group of flowering and foliage plants in the open division, Mr. G. MILES, Victoria Nursery, Dyke Road, Brighton, was 1st with a tasteful arrangement of mollis Azaleas, small Palms, Acacias, &c.; Mr. J. TURNER, gr. to Sir GREVILLE SMYTH, Wick Hall, Hove, following very closely.

In a smaller class, open to gentlemen gardeners only, Mr. G. SIMMS, gr. to C. J. INWOOD, Esq., Dyke Road, Brighton, beat Mr. F. RAPLEY, gr. to Mrs. VISICK, St. John's, Withdean; and Mr. J. LEWIS, 37, Preston Road, Brighton, was in front for a small group confined to amateurs only.

Tulips, Lily of the Valley, Spiraea, Deutzias, Cinerarias, Mignonette, Lachenaltes, Primulas, and similar subjects were numerously staged, Mr. E. MEACHIN, gr. to Mrs. AARSTRONG, Woodside, Withdean, coming to the front again in many cases, his Richardias, Deutzias, Azaleas, and Pelargoniums being very good. Mr. E. MEACHIN was also 1st for a table decoration of one stand.

Cut blooms of Narcissus were a feature of the show, Mr. JENNER, gr. to F. BARCHARD, Jr., Duddleswell, beating Mr. M. TONLE, gr. to F. BARCHARD, Little Horsted. There were no fewer than five Roses wrongly named in a box of twelve, in fact, cut Roses were a poor feature.

A class for six table plants found Messrs. W. MILES & Co., West Brighton, in front; Mr. L. WICKENS, gr. to Mrs. DAWSON-ROWLEY, Chichester House, Kemp Town, being 1st for a very prettily-arranged table of plants.

## NEWCASTLE-ON-TYNE.

APRIL 15, 16.—This society held its spring show in the Town Hall and Corn Exchange on the above dates, and it was one of the best spring shows it has ever held. The general arrangement of the show was all that could be desired, and in every way creditable to the Secretary, Mr. J. J. GILLESPIE, Jr., and his energetic committee. On the whole, the show was well attended both days. Perhaps the most important feature of the exhibition was the display of bulbs. There was quite a remarkable presentation of Hyacinths, the competition being so keen that in two or three cases the judges were compelled to resort to the record of points. Double Tulips also were worthy of special mention; as a matter of fact, there has never been such a fine show of this flower in the annals of the Society. Orchids, too, were more numerous, and of finer quality than usual, and the groups were the subject of great admiration.

The most striking exhibit of the show were the groups of miscellaneous plants arranged for effect, and here Mr. McINTYRE, gr. to Mrs. GURNEY PEASE, Woodside, Darlington, was deservedly placed 1st; the premier Medal being awarded him. The group consisted of choice exotics artistically arranged, and contained many fine novelties in

Orchids and other plants. The background was formed of Palms; and the groundwork of Ferns.

Mr. McINTYRE won the chief prizes for plants, such as Azalea indica, Dicentra spectabilis, and Spireas.

Mr. J. WOOD, Morpeth, was placed 1st for four pots of Hippeastrums.

The best six Cinerarias were those of Mr. W. PITT, 1st; and Mr. J. WOOD, Fenham, 2nd.

Primula sinensis, six pots, were well shown by Mr. McDONALD, gardener, Assot Hall, Dudley, 1st; and Mr. J. WOOD 2nd.

For Lily of the Valley, six pots, Mr. W. HANDSIDES, Newcastle, was 1st; and Mr. J. McINTYRE 2nd. The latter exhibitor took 1st prize for table decorations, and Mr. T. WHEELER 2nd.

Mr. Oliver, gr. to Lord RAVENSWORTH, Eslington, received a First-class Certificate for a sport from Count De Brazza Violet; and he was Commended for a collection of seedling Primroses. The Violet, which has the name Eslington Neapolitan, is of a pale blue colour, vigorous in growth, and floriferous.

Miscellaneous.—Mr. J. McINTYRE exhibited an excellent collection of clean stove and greenhouse plants, especially fine being the Rhododendrons and Clivias. Large Palms were placed sparingly among the flowering plants with good effect.

Messrs. FELL & Co., nurserymen, Hexham, exhibited a finely-arranged table of flowering plants, for which they were awarded a special prize. Mr. HILLIARD, Darlington, had a fine exhibit of pot foliage and flowering plants; Messrs. BROWN BROS., Uddington, N.B., exhibited a large collection of varieties of well-grown Narcissus, fine flowers, well staged.

Cut flowers did not form a large class, but such as there were, all of very good quality. Messrs. PERKINS, Coventry, and Mr. EDMONSON, Newcastle, divided the honours between them.

The exhibits of shower bouquets and sprays were better than in any previous year in regard to their forms, and the quality of the flowers used in them.

Auriculas.—In the classes for alpine and show Auriculas, Mr. PATTERSON, Ashburne Gardens, Sunderland, again took premier honours in most of the classes, with particularly fine examples. He was 1st for six, four, grey-eyed, white ditto, and self Auriculas. Other winners were Mr. T. E. HAY, for two Auriculas and one green-eyed variety. Mr. LEE, Millfield House, Newcastle, was 1st, and Mr. R. WILLIS 2nd, for six alpine varieties.

## SHEFFIELD CHRYSANTHEMUM SOCIETY, AND THE DAFFODILS AT TOTLEY HALL.

Mr. W. A. MULNER, J.P., of Totley Hall, kindly threw open his grounds and invited the public to see his charming collection of Daffodils on Thursday afternoon, and again on Saturday, the 16th and 18th inst., extending the invitation in particular to the members of the above Society, of which he is one of the Vice-Presidents. One hundred and thirty-three members took the opportunity to see this famous collection. Such varieties as Weardale Perfection, Madame de Graaf, Glory of Leyden, and Madame Plom, which are too expensive for the majority of people to cultivate, can be seen here in their best form. A few of the most noticeable varieties were Emperor, Empress, Horsfield, Sir Watkin, Barri conspicuus, J. B. M. Cann, Duchess of Westminster, Madame M. de Graaf, Titan, Princess Mary, Shirley Hibberd, Minnie Hume, Mrs. Langtry, Katherine Spurrell, Mr. J. Elwes, Maximus, C. J. Backhouse, Laura Wilson, Mrs. Vincent, W. P. Milner, Norse Bicolor, and many others. Noticeable was a very good seedling, very much like Glory of Leyden, which no doubt will be heard of again. It was a revelation to most of those who visited Totley. Some faint idea of the thousands of flowers to be seen can be given when we are told that 800,000, of 250 varieties, does not cover the quantity of bulbs; and some of the bulbs will throw three or four blooms each. The last few days' sunshine has brought the flowers forward; but there are still thousands of buds to open, and a few more days will see the collection in even greater perfection than it was on Saturday. M. H. W. S.

## THE NATIONAL AURICULA AND PRIMULA.

April 21.—The Annual Exhibition of the Society on Tuesday last was in many respects good, though scarcely so extensive as last year. As it was, there was considerable difficulty in finding room for some of the exhibits, the table space being restricted. The collections of Auriculas were so close together that difficulty was experienced in distinguishing the limits of the various classes, and then the placing in a continuous line of all the edged and self flowers, and a like disposition of the Alpines, imparted a monotonous appearance to the tables. It would be an easy matter, without in any way inconveniencing the judges, to break up the monotony by alternating the Alpines with the Show flowers, or by putting in panels of species as the showy Primroses by way of securing a little more effect. The old plan of arranging the classes to follow each other in the same sequence as in the Schedule, is still adhered to as if a custom never to be broken through. But what is badly wanted in this particular show is a person to take charge of

the arrangements, and see that the details are properly and expeditiously carried out. If judges were appointed beforehand and their work defined, the judging which on Tuesday was extended to nearly two hours, might be got over in less than half the time.

SNOW AURICULAS.—These possess the greatest value in the eyes of the florist, and are the leading feature on these occasions. They are the aristocrats of the Auricula community. They are clothed in jewelled garments, and in the case of the selfs, in blue, claret, or crimson, the golden tube, where it is present, and the zone of mottled paste, add distinction to the blossoms. They filled one side of the table, the monotony of the edged flowers broken only by an intermixture of the selfs. Perhaps never before were there seven collections of twelve varieties, and, it may be added, not a collectively inferior one among them. Some of the selfs were a little stale, but then they are generally the earliest to blossom. The foremost raiser of new varieties of the day, the Rev. F. D. HORNER, Lowfells, Bruton-in-Lonsdale, was 1st in this class, his collection containing the unusual number of five green-edged varieties, four of them being of his own raising—viz., Rev. Cecil Dalton, probably the most refined and best green-edge Mr. HORNER has yet raised; Orient, Kingfisher, and Dolphin—a quartette of which any raiser might well be proud; and Shirley Hibberd (Simonite), which greatly resembles the Rev. F. D. Horner by the same raiser, the latter one of the most popular and useful green-edges. Of grey edges, there were Lustre and Bulls-eye; Heatherbell, white-edge; and Favourite, Melanie, Iolanthe and Midnight, selfs, the last a large, dark, almost black self, faultless in pip and highly promising. It is rarely indeed that an exhibitor can stage eleven varieties out of twelve of his own raising.

Mr. A. J. SANDERS (gr. to Viscountess CHEWTON, Brookham Lodge, Cobham), was 2nd, and Mr. J. DOUGLAS, 3rd.

There were eight collections of six varieties. Mr. T. E. HENWOOD, Hamilton Road, Reading, taking the 1st prize with a superb green edge of his own raising, the large, solid, well-formed pips being edged with bright deep green, the other parts proportionately good; this variety was eventually selected as the premier Auricula in the Show, though some favoured Mr. HORNER'S Rev. C. Dalton as deserving of this honour. Mr. HENWOOD had Dinham, a bold green edge, and the ever popular George Lightbody; while George Rudd had quite a white edge on this occasion, and Acme and Mrs. C. Phillips, a rather small dark self of fine quality. The Rev. F. D. HORNER came 2nd with six of his own raising. Mr. A. J. SANDERS was 3rd with four plants. Mr. C. PHILLIPS, Bracknell, Berks, was 1st; he had the Rev. F. D. Horner, green edge, George Rudd and Dr. Kidd, grey edge, and Mrs. C. Phillips, self.

Mr. J. SARGENT, Cobham, came 2nd, and Mr. W. BADOCK, Reading, was 3rd; but with two plants the latter took the 1st prize, having The Rev. F. D. Horner, green edge, in excellent character, and Richard Headley, grey edge. Mr. J. SARGENT came 2nd with George Lightbody, as companion to The Rev. F. D. Horner.

Single Specimens.—Of these there was a goodly quantity put together in a somewhat irregular manner, from which the judges have to select about eight prize flowers. Such classes afford a little more prize-money to the exhibitor, but add little to the interest of the Show, or its effect, as no order is observed in placing the collections on the stage. The best green edges were the Rev. F. D. Horner and Horner's Day-break, small, and not yet developed, but decidedly promising. In the grey-edged class George Lightbody carried off the leading honours; Acme was the best white edge, Bean Blossom (Horner), taking 2nd place. The best self was Horner's Heroine, Mr. Potts taking the other prizes.

Collections of Fifty Auriculas.—Of these there were four, one coming from distant Sunderland. Mr. J. DOUGLAS who has generally taken the highest honours in this class had on this occasion to give place to The GUILDFORD HARDY PLANT COMPANY, who had the advantage of not contributing plants to any of the previous classes. In this group Old Lancashire Hero, in its green-edged character, was very good; also Buttercup, yellow self; other selfs in good character were Black Ross, and Mr. Potts; green edge, Abbe Lizst and the Rev. F. D. Horner; while Col. Champney's grey edge, now rarely seen, was very conspicuous with its violet body colour. Mr. DOUGLAS had white edge, Miss Prim, with a bright purple body colour; and Venus, also white edged, Buttercup, Ajax, grey, and Mr. Pott's self. This is a class which adds to the bulk of the Show, but it has little value as adding to its effect.

Alpine Auriculas.—These always attract by their bright and telling colours. The charm of the edged class of show Auriculas is that they are so chaste and unusual, with a quaint softness and demureness that irresistibly attract. The Alpines have striking combinations which afford brilliant colouring, and they at once attract the eye. But there were only four collections of twelve varieties, Mr. J. DOUGLAS being 1st with varieties generally of excellent character, mainly of his own raising. Dean Hole was one of the most vivid in point of colour in the whole Show. But there was generally throughout this section a lack of the fine finish which usually characterises them; and varieties of large size, strongly grown, are bound to show some coarseness. Mr. A. J. SANDERS was 2nd; he had Edith (Turner), a pretty cream-centre, in good character; Mr. C. PHILLIPS being 3rd.

There were seven collections of six varieties, Mr. C. PHILLIPS being 1st, mainly with seedlings of his own raising; Mr. J. DOUGLAS was 2nd; and Mr. A. J. SANDERS, 3rd.

With four Alpines, Mr. J. J. KEES, Southampton, as 1st, also with varieties of his own raising, but showing a good

deal of success in character; Mr. W. L. WALKER was 2nd, also with seedlings. Every exhibitor of Alpine Auriculas is also a raiser of seedlings.

*Single Specimen Alpines.*—Mr R. PATTERSON, of Sunderland, had the best gold-centred variety in Gertrude Jane, a production of his own; Mr. KEEN taking the three following prizes with seedlings. Mr. Harry Turner, shown by Mr. A. FISK, was the best white-centred variety. Mr. J. GILBERT came 2nd, with Victor; and Mr. KEES 3rd, with Theosus.

*Fancy Auriculas.*—These may be taken as representing curious breaks in the show section of Auriculas, appearing among the seedlings, and blooming in grotesque garb as if aliens to the race. Rich in colouring, yellow predominating, and of fine form of pip they are too good to be made out-casts, and so they are grouped as fancies, and a class is provided for them, to which yellow self, doubles, and laced varieties can be admitted. The best twelve came from the GUILDFORD HARDY PLANT COMPANY, Mr. J. DOUGLAS being a close 2nd, and Mr. R. DEAN 3rd.

*Giant Polyanthus.*—These were shown in pots and in baskets. The best twelve plants in pots came from Mr. DOUGLAS, who had large examples of attractive colours and highly effective. Mr. A. J. SANDERS was 2nd. The 1st prize for the best basket went to Mr. J. T. POE; the 2nd to Mr. DOUGLAS, but we think the order should have been reversed. Messrs. PAUL & SON were 3rd.

*Primroses, Single Varieties.*—Shown in pots of twelve, were striking patches of colour, but there was a drawn appearance about the plants and a coarseness observable in some of the flowers, as if too highly fed. Mr. J. DOUGLAS, who was 1st, had some bright colours; Mr. A. J. SANDERS was 2nd. The double varieties were in sixes. Mr. DOUGLAS had well-grown and flowered potfuls of the rich double crimson, late yellow, lilac, white, purple, and blush. Mr. R. DEAN was 2nd, with smaller plants.

*Groups of Species, &c.*—Mr. DOUGLAS was the only exhibitor of twelve specimens, generally large, nicely grown and bloomed, consisting of two varieties of japonica, three of Sieboldi, including the bright-bued laevis, verticillata, melis, obconica (a poor example), Forbesi (small, but very pretty), floribunda, intermedia, and Auricula. There was also a class for a group of species or varieties in a box or basket. Mr. J. DOUGLAS had his 1st prize lot in a box of rockwork. At the back of this were examples of japonica, verticillata, and Sieboldi, with show, Alpine, and fancy Auriculas, and small Alpine species. The GUILDFORD HARDY PLANT CO. came 2nd, with a similar arrangement in a small basket, having strong-growing forms behind, with small Alpine species, Auriculas, Primrose, &c., in the foreground. This we thought the more effective of the two, but it did not commend itself to the judges in that light.

With six species and varieties, Messrs. PAUL & SON, Cheshunt, were the only exhibitors, having types similar to those shown by Mr. Douglas.

*New Varieties of Auriculas.*—In the class for seedling white edges, a 1st prize was awarded to Mr. J. DOUGLAS for Vesta, a classic and pleasing flower, of a promising character; the Rev. F. D. HOBNER taking a 2nd prize with Snowflake. No group of grey-edges, or selfs of character, were shown. Mr. DOUGLAS'S Vesta was also awarded the special prize offered by Mr. W. SMITH for a white-edged variety, judged to be an improvement upon existing varieties.

Of seedling Alpines, Mr. C. PHILLIPS had, of gold centres, Pluto, which took the 1st prize; Mr. DOUGLAS coming 2nd with Lord Collingwood; but it would be difficult to say these are improvements on existing varieties. In the class for white centres, Mr. C. PHILLIPS had 1st and 2nd prizes for two unnamed seedlings.

*Miscellaneous Contributions.*—Messrs. JAMES VEITCH & SONS had a striking collection of Mr. G. F. Wilson's blue Primroses in many shades of colour, all profusely bloomed; and Mr. R. DEAN a collection of gold-faced Polyanthus, and yearling Primroses of bright colours, both from the open ground. Some blooms of a very large common yellow Primrose came from Hampton Court, Loominster; white Primroses and Polyanthus were to be seen in almost every collection of hardy flowers in the Hall.

## INTERNATIONAL HORTICULTURAL EXHIBITION at LEDEBERG, near GHENT.

APRIL 12-19.—This Exhibition, organised by the *Cercle Horticole Van Houtte* under the presidency of M. Gustave Botcheberg, was a great success. A great hall, specially built for the occasion, the sales des fêtes and de mariage, and the court-yard of the Hotel Communal, were literally crammed with plants. The following is a brief notice of the various groups:—

*1st Group.—Miscellaneous Plants.*—The Société Anonyme Horticole Louis van Houtte Féro won the first prize (par acclamation) for forty miscellaneous plants, including *Alceosa Thibautiana*, *Phyllotanium Lindenii magnificum*, *Anthurium crystallinum*, and *Schismatoglossis Robelini*.

M. DELARUYE and MM. DE SMET FRÈRES won success with groups of well-known and favourite decorative plants. Flowering plants from MM. DRIESSECH LEYS, and COLLIARDIEN were excellent. Among the noteworthy exhibits of the former were *Rhododendrons* Countess of Haddington and Edgworthii, and of the latter exhibitor *Acacia cordata*, several specimens of *Erica* and *Genista Andreana*.

An *Anthurium Scherzerianum atrosanguineum* superbum, from M. JULES DE COCK had an unusually large spathe.

*2nd Group.—New Plants.*—Among M. JULES DE COCK'S exhibits in this Section were *Myriolepis Scortechini*, *Juniperus japonica aureo-picta*, *Geonoma Schmiti*, *Eriocnema Sanderiana*.

M. A. DE SMET showed *Dianella Tasmanica*, fol. var., M. DELARUYE, *Nephtytis picturata* and M. A. RIGOUTS, *Dracena Rigoutsi*, raised from D. australis.

The Section for Seedling plants other than Azaleas, *Rhododendrons*, and *Orchids*, included *Dracena cannaefolia aureo-striata*, and *Corypha australis*, fol. var., from M. JULES DE COCK; *Pteris Buchneri* from M. A. VANDER HEDEDE, and *Dracena cannaefolia variegata* from M. A. DE SMET.

*3rd Group.—Flowering Orchids.*—An award was made par acclamation for seventy-five *Orchids* from M. CH. VUYLSTEKE; among which were *Odontoglossum triumphans*, luteo purpureum, tenticulatum, radiatum, macropodium, and mulis; *Cattleya amethystoglossa*, *Masdevallia ignea pulchra* (a new introduction), and other species.

M. JULES HYE won seven 1st prizes for his beautiful *Orchids*, among which were *Odontoglossum nobile*, much spotted; *Pescatorei album*, as rare as elegant; heterodon, very rare; *nevadense*, elegans, Andersoni; and nobiliss, a wonderful and successful variety; *Cypripedium triumphans* (Sallieri Hyeanum x *anethum superbum*), a hybrid, and very glossy; *C. Hyeanum*, with a bloom of unusual size and beauty; *C. Albertinum*, ornatum, C. Flamingo, C. Minerva; *Miltionopsis Bleui*, with twelve very large flowers, and a fine *Ephippionit Veitchii*.

MM. DE SMET FRÈRES exhibited fifty well-bloomed examples of *Odontoglossum crispum*; M. JULES DE COCK some fine *Cypripediums*, notably exul, *Haynaldianum*, *Elliottianum*, and nitens. I would further mention *Vanda Wallichii* from M. HYE; and a fine plant from the Beaucarne sale, and of which M. DE LA DEVANSAYE possesses a second example.

*4th Group.—Palms, Ferns, Cycads, Pandanus.*—THE BROTHERS DE SMET were highly successful here with their magnificent specimen *Palms*, *Ferns*, and *Cycads*. M. ALBERT RIGOUTS showed some fine *Palms*, among them *Kentia australis*; *Phoenix senegalensis*, and *Sabal Blackburniana*.

Among new *Palms* may be mentioned *Geonoma acaulis*, and *Arenga Wightii*; and *Calamus Alberti* from Messrs. SANDER & CO.

The Tree Ferns of MM. DE SMET FRÈRES; the herbaceous and the Ferns (greenhouse) from M. DESIRE VAN HERZELE were excellent, as were those from MM. DUYREZ FRÈRES; among the latter plants being a good *Adiantum macrophyllum*, fol. var. M. VAN HERZELE sent some fine *Selaginella*; M. ERNEST DELARUYE a fine *Pandanus Veitchii*; and M. PYNARST a good and well-grown plant.

*5th Group.—Store and Greenhouse Plants, non-flowering.*—*Anechthochilus*, *Bertolonias*, and *Sonerias* from M. VAN G. DALLIÈRE also this exhibitor's *Nepenthes*; *Bromeliads* from M. POELMAN-MANNOU, including numerous *Vrieseas*.

*6th Group.—Aroids.*—A very important group. M. A. DE SMET won the 1st prize with twenty-five flowering *Anthuriums*: *Secrétaria E. Fiensis*, *Comtesse de Kerchove*, *Souvenir de Lieven Spae* (with a large and bright red spathe), *carneum*, and particularly *Wm. Wallen* deserve special notice. The latter variety has a spathe which is first white, then shaded with pale rose, and lastly rosy salmon. The *Anthurium Scherzerianum* with red spathes from M. A. DALLIÈRE were good examples; so were those with white spotted and speckled spathes from M. A. DE SMET, notably the varieties *M. Regnier*, *Victoria*, *Mme. Wallen*, *Sung gaulois*, and *Reine des Pays Bas*.

M. VERVAENE-VERVAERT exhibited *Anthurium Scherzerianum* Louis De Smet, *Mme. Wallen*, *tigrinum* (with a greenish white ground), *La Reine* (beautiful and white), and *Congolais* (dark red). In the same group was a lot of *Caladium* from the Co. LOUIS VAN HOUTTE, the foliage handsome; the specimens well grown.

*7th Group.—Greenhouse and Open Air Foliage Plants.*—MM. JULES DE COCK and PIERRE PARRÉ showed fine collections of plants with variegated leaves; MM. ERNEST DELARUYE, BERNARD SPAK and THIENPOT ET CIE., collections of greenhouse *Arcturarias*, including the varieties *elegans compacta*, *Cunninghami*, *Rufei*, *Bidwillii glauca gracilis*, and *B. glauca robusta*.

M. PIERRE PARRÉ showed *Dracena Prince Albert*, with the leaves very narrow, gracefully curved, green in the centre, the edges whitish-yellow. The same exhibitor staged D. Donetti; MM. DE REYS FRÈRES, D. australis (variegated). M. MAERTENS BEYS obtained a 1st Prize for *D. cannaefolia*, fol. var., the petioles and edges of the leaf-blades of which were yellowish-white: a beautiful plant.

MM. C. KERCKVOORDE and F. BURVENICH FÈRE, staged fine collections of *Conifers*; the specimens were small, not more than 3 feet in height.

*8th to 10th Groups.—Flowering Specimens of Azalea indica and of Out Door Azaleas and Rhododendrons.*—The firm of D'HAENE and M. JOS. VERVAENE won each a 1st Prize for their groups of large and fine specimens, not necessarily new.

Among the seedlings (ten varieties), from M. J. VERVAENE the best were: *Merveille de Ledeborg*, double, dark carmine with black spots with a sheeny metallic lustre, very beautiful; *Spitfire*, flame coloured, double, with black spots; *M. Debulle*, carmine, single flowers with purple spots; *Prince Albert*, reddish lake, rounded in shape, delicately spotted with black purple, single; *M. Ker*, single, bright lake spotted with crimson. 1st Prize for a seedling *Azalea*, double, M. Millaut, very bright Bordeaux red, resembling A. Le Flambeau, the flower large, well rounded; very free-

flowering and strong-growing apparently. 1st Prize for a seedling *Azalea*, single, *Mme. Millaut*, bright cerise red with bluish and white shades over it when seen against the light. A fixed spot not in the market was, *Salmonea*, with a single, orange rosy flower streaked with red, with a wide white border.

M. EUGÈNE DE COCK obtained a 2nd Prize for an unnamed double seedling: the flower broad, well rounded, pure white, with two corollas within the other, the centre variegated with streaks of rose colour and greenish spots. Among the sports M. J. VERVAENE showed with success *Madame Carnot*, *Ami V. Cuvelier*, *Madame Romain De Smet* and *Madame J. Vervaeue*.

M. VERVAENE-VERVAERT among his six new hybrid *Rhododendrons* showed *Souvenir de Dominique Vervaeue*, rosy white with a deep black purple spot at the base, clearer above; *Printemps*, rather bluish white at first opening, afterwards turning nearly white, spotted with black; *Ch. De Bosschere*, bright rose with a black spot.

M. J. BAUMANN sent some beautiful Himalayan and hybrid *Rhododendrons*, among them *Dalouisia*, *Victorianum*, *Marchioness*, *Rosy Bell*, *Countess of Sefton*, *roseum odoratum*. The latter is not a Himalayan hybrid but a cross between an *Azalea* and a hardy *Rhododendron*.

M. V. CUVELIER staged R. *Tonkinense* grown from seed from Tonkin, the flowers white with a wide blue margin; *Dalouisia roseum* with rose-coloured flowers; *Annamense*, a species from Annam with moderate sized scented flowers, white with a golden yellow spot; *magniflorum*; *Bridal Bouquet*, a seedling with a large rose-coloured flower with a blackish spot, and highly perfumed.

R. *Jacconii* sent by M. MAERTENS BEYS is a pretty outdoor variety with white flowers which seems to remain dwarf and will be useful for bedding; apparently very free-flowering. There were many *Azalea mollis* but all unnamed.

*Camellias* were well represented by M. VAN DRIESSECH and by a specimen plant from M. J. VERVAENE; C. *Augustine superba*.

*11th Group.—Greenhouse Flowering Plants.*—In this group were some fine *Chivias* from MM. B. FORTIE and G. VAN HERZELE, with large rounded trusses and flowers of brilliant colouring.

In M. FORTIE'S collection were *Gust Botelberge*, *Martha*, *M. R. de Kerchove*, *Dr. de Ph. Blanquet*.

M. CH. VERMEIRE obtained the 1st prize for a seedling (*Chivia* which has a fine truss of large framing orange flowers with parallel pure white streaks down their centres, the base golden yellow).

Some good plants from the Cape and New Holland were shown, among them *Genista elegans*, *Grevillea rosmarinifolia*, *Acacia verticillata*, *paradoxa*, *Barkeri*, *cordata*, *Erica arborea*, *E. arborea cucullata*, *Grevillea alpestris*, *Boronia molini*, *Leptospermum bullatum*, *Brachycaea acuminatum*, *Diosma fragrans*, *Lithospermum fruticosum*, and other species. The finest entries were those from MM. J. DE COCK, L. VERVAENE FILS, E. COLLIMBIEN, G. FIETIN, G. DE SAEGHER; some remarkable *Boronia* came from MM. A. DIGOUTI and E. COLLIMBIEN, and a fine *Cytisus* from M. DE SAEGHER.

*12th Group.—Flowering bulbous and tuberous Plants.*—There was a good collection of fifty *Amaryllis* from M. C. VUYLSTEKE; of *Cyclamen* from M. L. BOTELBERGE FILS; *Gloxinias* from M. ERNEST DELARUYE; and *Hycacinths*, *Tulips*, and *Narcissus* from the SOCIÉTÉ LOUIS VAN HOUTTE FÈRE.

*13th Group.—Herbaceous and Perennial flowering Plants.*—*Pelargonium Odier* from M. DELARUYE; *Convallaria majalis* from M. L. COLLE; *Hydrangea* from MM. POL. WYCKAERT FILS, and VERVAENE-VERVAERT; *Spirea japonica aurea reticulata* from M. L. COLLE; *S. jap. compacta multiflora* from M. B. BOUCKBOU; and *S. palmata* from M. A. DE MEYER, were noteworthy.

*14th Group.—Out-door Plants and Forced Shrubs.*—This Group included some fine white-flowered *Kalmia* from M. J. DE COSTER and the firm of D'HAENE; a fine flowering specimen of *Andromeda* and a lovely white *Deutzia gracilis* from M. CARMONT.

*Unclassified.*—There were some fine specimens of *Asparagus Sprengeri* from MM. SCHURRER & CO., of Bonn; *Cochin-Chinese Pineapples* from M. F. BUYESSE; *Caraguata cardinalis* from M. DE LANGHE-VERVAENE; *Streitizia* from M. G. BOTELBERGE. Messrs. SANDER & CO. showed *Calamus Alberti*, *Ch. de Bosschere*.

## THINNING CHOICE FRUITS.

It is a bad practice to allow individual trees of the under-mentioned kinds, which have set heavy crops of fruit, to waste their forces in swelling up to the stoning stage three or four times as many fruits as it is intended should remain, there being no fear that healthy trees, whose roots are kept uniformly moist, will drop their fruits before ripening. In the case of trees the reverse of healthy, the practice is even less to be defended, seeing that the means employed to secure a fair crop of fruit are rather calculated to thwart the object in view by greatly exhausting the energies of the trees, by carrying fruit that will be sacrificed, as to render the tree incapable of carrying a fair crop to maturity. From this cause arises the dropping of the fruits left on the trees for a crop, which, had the surplus fruits

been removed at the outset, would have gone on without any loss. In the case of strong, healthy trees, the deferring of the thinning of the fruits till stoning has taken place is simply a wasting of the forces of the tree; but with trees the opposite of this it means loss of crop, if not absolute collapse. Hence the necessity for early thinning—that is, thinning the fruit to the proper distances from one another as soon as set. This remark applies equally to the same kinds of fruit when grown under glass, as well as to Grapes. Apricots should be thinned out to 6 inches (super.), allowing 6 inches more space every way between the fruits on Peach and Nectarine trees in robust health; but cropping less robust-growing trees lighter. This is sound practice and good advice, looked at from a commercial point of view—which is the all-important point, not only in horticultural and agricultural pursuits, but in most others. The result of judicious thinning of the fruit is that an equal weight of crop is obtained from less than half the numerical quantity of ordinary-sized under-thinned fruit, and which, owing to the fact of being extra large and handsome in appearance, command more than double the price per dozen.

GRAPES.

In determining the number of bunches of Grapes which a Vine should carry, the length and strength of the rods should be considered, as well as the size of bunch which the variety is capable of bringing to perfection with high cultivation, bearing in mind the fact that young vigorous Vines will produce larger-framed bunches than would result from the same Vines grown under favourable conditions when ten or twelve years old; consequently, fewer bunches should be left for a crop than would otherwise be deemed sufficient, in order to swell out the berries to the largest size, obtain fine colour, and ripen satisfactorily, without overtasking the energies of the Vines.

A fully-established and well-conditioned Vine of, say, 18 feet in length, of Black Hamburg, Madresfield Court, Muscat of Alexandria, Gros Colmar, Gros Maroc, Mrs. Pince's Black Muscat, Mrs. Pearson, Golden Queen, Foster's Seedling, Buckland Sweetwater, Black Alicante, and Alwick Seedling, showing fairly large bunches, likely, when ripe, to turn the scale at 3 lb., and colour well at the same time, should not be allowed to carry more than seven or eight bunches; and during growth, such Vines should have liberal supplies of tepid liquid-manure at the roots, alternated with dressings of artificial manure when affording clear water.

A greater or lesser number of bunches, according to their size and the length of the rod, may be safely retained for a crop, providing the weight of Grapes does not much exceed 1 lb. weight per foot run. In a general way, nine or thirteen bunches of Lady Downe's, weighing from 1½ lb. to 2½ lb. (thirteen of the former, and nine of the latter weight) each, may be left on each Vine of the length indicated for a crop.

In the case of large bunched varieties, such as Gros Guillaume, Trebbiano, and White Nice, mistakes are often made in leaving more bunches for a crop than the Vine is capable of finishing satisfactorily, cultivators forgetting that the larger the bunches the fewer the number. One twelve-pound bunch of Gros Guillaume, and two or three smaller, should be allowed for a crop in preference to leaving two large bunches. Three or four seven-pound bunches of Trebbiano or White Nice are sufficient for a Vine if its continued vigour is duly considered, and all surplus bunches should be removed as soon as it can be seen which are the best bunches; and the berries should be thinned very soon after they are set, so as not to unnecessarily waste the forces of the Vines, as is the case when Grapes are allowed to attain to the size of Green Peas before being thinned. The berries should be thinned-out at once to 1 inch from berry to berry as early as possible after they are set, retaining the crown or central berries. Those engaged in the work of thinning should, in addition

to a sharp-pointed pair of scissors, have a small-forked Birch twig with which to raise the shoulders of the bunches whilst thinning them. Loose shoulders are better cut off, single-stemmed bunches being preferred. A space of rather more than 1 inch from berry to berry should be allowed in thinning bunches of Gros Maroc and Gros Colmar; and in thinning bunches of Gros Guillaume and Buckland Sweetwater, all that is necessary in a general way is to cut out all the small berries, as these, being furnished with long footstalks, will have ample room to swell out to due size.

Large bunches of White Nice, Trebbiano, and Gros Guillaume should have the shoulders tied neatly and carefully out, suspending the points with a series of ties from the trellis, care being taken to afford additional support to the points and shoulders generally as they extend in growth, otherwise the increased weight of the extremities of the individual bunches will cause them to assume a perpendicular position, and to be cut through at the point of contact with the ties W. H. Ward.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending April 18, is furnished from the Meteorological Office:—

"The weather was very changeable during the greater part of the period, frequent showers of hail or rain alternating during the earlier half of the week, with intervals of clear sky. Towards the end of the week, however, the conditions became more settled, and the showers ceased.

"The temperature was either just equal to or a little below the normal over the greater part of the kingdom, but was slightly in excess in Ireland, S.; England, S.W., and the Channel Islands. The highest of the maxima were recorded on the 18th, and ranged from 65° in the Midland Counties, and 64° in England, S.W., to 58° in Scotland, N. and Ireland, N., and to 56° in the Channel Islands. During the earlier part of the week the daily maxima were somewhat low. The lowest of the minima were recorded, as a rule, on the 14th or 15th; they varied from 24° to 26° in

Scotland, from 33° to 37° in Ireland, and from 29° to 36° over England.

"The rainfall did not differ much from the mean value, being slightly in excess in some parts of the kingdom, and showing some deficiency in others.

"The bright sunshine was fairly abundant over the greater part of the country, but was again deficient in Ireland, as well as over the east, south, and south-west of England, and in the Channel Islands. The percentage of the possible duration ranged from 45 in Scotland, W., and 43 in England, N.W., to 31 in England, S., 27 in Ireland, S., and 24 in Ireland, N."

OLD POTATOES.

Good samples and quality in fair demand, inferior kinds unsaleable.

NEW POTATOES.

Arrivals from the Canary Islands this week were rather heavy, but demand being good, prices have been well maintained. Malta Kidneys, best, 12s. to 15s.; do., ordinary, 9s. to 11s.; do., small, 7s. to 7s. 6d.; do. rounds, 8s. to 10s.; Canary Kidneys, best, 12s. to 14s.; do. ordinary, 7s. to 10s. per cwt. J. B. Thomas.

## SEEDS.

LONDON: April 22.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market had an average attendance. There is now an active consumptive demand for the leading varieties of farm seeds, under the influence of which, combined with a daily increasing speculative inquiry, values all round exhibit considerable strength. Notwithstanding the recent advance, fine samples of Clovers and Grass-seeds can still be bought on most reasonable terms. Tares move off slowly. Canary-seed is lower than ever. The Hemp-seed market keeps steady. Wisconsin green boiling Peas readily find buyers for holding over. Haricot Beans are unchanged. Full prices are asked for Rapeseed.

## FRUIT AND VEGETABLES.

BOROUGH: April 21.—Quotations:—Onions, 4s. 6d. to 5s. 6d. per bag; Carrots, 2s. to 3s. 6d., and Turnips, 2s. to 2s. 6d. per dozen bunches; Cabbages, 2s. to 2s. 6d. per tally; Horseradish, 9s. to 12s. per dozen hundred; Apples, 4s. to 6s. per bushel.

SPITALFIELDS: April 21.—Quotations:—Bunch Greens, 1s. 9d. to 2s. per dozen; Parsley, 1s. to 1s. 6d. per dozen bunches; Mint, 1s. 6d. to 2s. do.; Spring Onions, 1s. to 2s. per dozen bunches; Kale, 9d. to 1s. per bag; Broccoli, 9d. to 1s. do.; Cabbages, 1s. 6d. to 3s. per tally; Cauliflowers, 4s. to 7s. do.; Carrots, 1s. 6d. to 2s. per dozen bunches; Turnips, 2s. to 3s. do.; Leeks, 1s. 6d. per dozen; Beetroot, 1s. 3d. to 1s. 6d. per bushel; Apples, cooking, 7s. to 9s. per bushel; dessert, 8s. to 10s. do.

STRAFORD: April 22.—Trade has been rather brighter, and better clearances effected. Quotations:—Cabbages, 2s. to 4s. per tally; Greens, 1s. to 2s. per bag; do., 9d. to 1s. per sieve; do., 2s. to 3s. per dozen; Cauliflowers, 9d. to 1s. 6d. per dozen; do., 3s. to 8s. per tally; sprouting Broccoli, 9d. to 1s. per bag; Beetroot, 4d. to 5d. per dozen; Horseradish, 1s. to 1s. 3d. per bundle; Parsley, 6d. to 1s. per dozen bundles; Rhubarb, forced, 1s. to 1s. 3d. do.; do., field, 1s. 6d. to 2s. do.; White Turnips, 2s. to 2s. 6d. do.; Leeks, 1s. to 2s. do.; Spring Onions, 1s. to 1s. 6d. do.; frame Cucumbers, 1s. 6d. to 2s. 6d. per dozen; salad, 1s. to 1s. 9d. per dozen punnets; Carrots, household, 20s. to 32s. per ton; do., cattle feeding, 14s. to 20s. do.; Parsnips, 4d. to 9d. per score; Mangels, 12s. 6d. to 18s. per ton; Onions, 5s. to 6s. per bag; do. Egyptian, 12s. to 130s. per case; Apples, Nova Scotian, 16s. to 24s. per barrel.

FARMINGTON: April 23.—Quotations:—Cauliflowers, 5s. per tally; Greens, 1s. per bushel; Cabbages, 2s. 6d. per tally; Onions, Spring, 1s. 6d. per dozen bunches; Horseradish, 1s. 2d. per bundle; Leeks, 1s. 6d. per dozen; Parsley, 1s. 6d. per dozen bunches; Asparagus, 2s. 3d. to 2s. 6d. per bundle; Tomatos, 1s. 9d. to 2s. per box; Cucumbers, 3s. per dozen; Apples, Tasmanian, Ribston, 15s. 6d. per case; Adams' Pearmain, 13s. 6d. do.; Pine-apples, 2s. to 3s. each.

## POTATOS.

BOROUGH: April 21.—Quotations, in a dull trade, ranged from 25s. to 8s. per ton for Old; and New Jersey were sold at 2d. to 3d. per lb.; Maltese at 10s. to 12s. per cwt.

SPITALFIELDS: April 21.—Quotations:—Bruce, Highlands, 40s. to 50s.; Main Crop, 40s. to 50s.; Sutton's Abundance, 45s. to 60s.; Imperators, 40s. to 50s.; Drones, 45s. to 50s.; Scotch Bruce, 40s. to 50s.; do. Main Crop, 45s. to 60s.; do. Dunbars, 70s. to 90s. per ton.

STRAFORD: April 21.—Quotations:—Dark soil, Bruce, 20s. to 25s.; light do., 25s. to 55s.; Reading Giants, 30s. to 60s.; Sutton's Abundance, 40s. to 60s.; Scotch Main Crop, 70s. to 85s.; do., Magnums (Dunbar), 55s. to 65s. per ton.

FARMINGTON: April 23.—Quotations:—Main Crop (Lincoln), 70s. to 80s.; do., Bed ords, 45s. to 50s.; Bruce, 35s. to 45s.; Magnums, 30s. to 40s. per ton; New Canary Is ands, 11s. to 13s. per cwt.

## HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 55s. to 87s. 6d.; inferior, 35s. to 69s.; hay, best, 60s. to 85s.; inferior, 30s. to 55s.; mixture, 60s. to 84s.; and straw, 20s. to 40s. per load.

## CORN.

Averages. Official statement of the average prices of British Corn, imperial measure (qr) for the week ending April 18, and for the corresponding period last year—1896; Wheat, 24s. 11d.; Barley, 23s. 1d.; Oats, 14s. 1895; Wheat, 20s. 6d.; Barley, 21s. 2d.; and Oats, 14s. 5d.

APPLE ANALYSIS: J. M. The analysis quoted is that of the ash of the fruit, consequently it could not contain the amount of water, which is nearly 98 per cent.

ASPARAGUS CULTURE.—Mr. Louis Gentil desires us to say that it is not the stocks (see p. 488) that are to be destroyed when the gathering is finished, but the hillocks.

BARBER BROS. ADDRESS: J. M. It is not known to us. Too indefinite.

BOOKS: *Constant Reader*. For a list of British plants, get the *British Flora*, by Bentham & Hooker, together with illustrations (separate vols.).

CRICKET GROUND: J. T. If the slope of the ground is regular, it should suffice to turn it as it were on its axis; that is, the ground level at the halfway point should be retained, and levels taken from a wooden peg at this point in the length and breadth. To do this with simple contrivances, put in stout wooden pegs around the central one, at say 12 feet distant in radial fashion, and obtain a dead level with the plummet and builder's "straightedge;" then with three boring rods, i.e. T pieces of wood, 4 feet high, fix the levels all over the piece of ground by taking sights with these, driving in stout pegs so as to have points to level up or down to. In the high portion of the ground, so called drifts or narrow trenches should be dug out, and the levelling pegs be placed in these, or simple holes dug out sufficiently deep, and a peg placed in each. Having two level fixed points, the level of the ground can be ascertained in all directions. The levelling may simply involve the wheeling away of the soil down to the ascertained level in the high part, and depositing it on the lower part, so as to bring that part up to the height of the pegs. Before commencing operations it may be advisable to skim off the turf, if it be fit for turving the pitch, cutting it into squares of 12 inches or strips of 3 feet by 1 foot, and laying it in heaps out of the way of the ground work. The upper spit should also be reserved for covering the surface after the levelling is finished, it being placed in ridges or heaps convenient for wheeling on to the ground. All slopes at the sides of the new pitch should be made very easy.

ERRATUM.—Page 486, April 18, article "Market Gardening under Difficulties," line 26, for "ten" read "two."

EUCARIS: G. M. There may be some disease in the bulbs. Can you send one or two, and a spotted leaf for examination?

FUNGUS: *Thos. Trollope*. *Peziza* (Lachnea) *Sumneriana*, figured in Cooke's *Mycographia*, fig. 111. Usually growing under Cedars. M. C. C.

HOLLYHOCK: W. P. There is no disease. The stem died down from frost or other cause, and a number of shoots proceeded from the base as a consequence.

MUSHROOM-SPAWN: D. Field. So far as we can tell, it is very good spawn; but, as you know, "the proof of the pudding," &c.

NAMES OF FRUITS: G. F. I. Pitmaston Golden Pippin; 2, Rymmer; 3, Mère de Ménage.

NAMES OF PLANTS: H. E. D. 1, Thuja (Biota) orientalis; 2, *Kerria japonica*; 3, perhaps the Mountain Ash, *Pyrus aucuparia* (a poor scrap).—*Notice*. 1, *Acer platanoides*; 2, *A. pseudo-platanus*; 3, *Lucumbe Oak*, *dentata* var.; 4 and 5, varieties of *Evergreen Oaks* (*Quercus ilex*); shoots without a number—*Viburnum Lantana*.—G. M. 1, *Dendrobium superbum*, often called *D. macrophyllum*; 2, *Phlox subulata*; 3, *Berberis empetrifolia*; 4, *Forsythia suspensa*; 5, *Berberis* (*Mahonia*) *aquifolia*; 6, *Berberis Darwinii*; 8, *Phyllirea latifolia*; no number, *Doronicum caucasicum*, yellow.—S. G. 1, *Pyrus malus spectabilis*; 2, *Spiraea prunifolia*; 3, *Amelanchier canadensis*; 4, *Pyrus salicifolia*; 5, *Prunus pseudo-cerasus*; 6, a Pear which we cannot name.—F. G. *Sambucus canadensis*; *Hippophae rhamnoides*.—*Vvmo*. 1, 2, 3, 4, probably forms of *Rhododendron Veitchii*, but how can we tell from single withered blooms? 5, *Diosma capitata* alba; 6, *Amelanchier canadensis*; 7, *Cornus mas*.—J. R. *Dicentra eximia* and *Litobrochia vespertilionis*.—J. B. N. *Dendrobium formosum*.—*Blackmoor*. The large one is *Dendrobium albosanguineum*, the other *D. crepidatum*.—T. J. C. *Teucrium fruticosum*.—L. F. (*Fern*). So far as we can judge, the specimen sent is *Blechnum cartilagineum*.—G. H. M. 1, *Cattleya Mendeli*; 2, C. Skinneri.—*Ignoramus*. 1, *Draecena rubra*; 2, *D. fragrans*; the Palm is *Chamaeops excelsa*; the other cannot be identified by the leaf, send when in flower.—G. H. G. Thanks for your letter. *Oncidium* and *Odontoglossum* may

occasionally be seen flowering as your sketch shows.—G. B. Small pink flower is *Pyrus Malus spectabilis*; the other *Cianthus puniceus*.—H. S. Send better specimens, more carefully packed; you do not appreciate the condition in which they reach us.—J. C. 1, *Citrus trifoliata*; 2, *Spiraea prunifolia*; 3, *Amelanchier canadensis*; 4, Japanese Maple; 5, *Odontoglossum citrosium*; 6, *Gnidia*, a mere scrap.

PEACH BLISTER: A. W. Smith. Due to the attacks of a fungus, often figured in the *Gardeners' Chronicle*. Careful spraying with the Bordeaux Mixture in the early season would probably check it.

PRESSING AND DRYING FERN FRONDS: F. W. Purchase any coarse—not too bihulous—paper, place your fronds between the sheets, place under pressure, and change the paper every other day till the fronds are dried; and when this has occurred, fasten them on to the paper with gummed strips of paper; write the botanical and the popular name, and place away in a drawer or case in a dry place.

PRUNING MARÉCHAL NIEL IN A GLASS-HOUSE: W. G. Cut it back severely each year after flowering, it will then make, after resting a short time, a number of shoots; lay-in the best of these, so as to cover the space allotted to the Rose, removing all weakly shoots entirely. Get this wood well ripened, and do not prune it again till it has flowered. Manure heavily, and top-dress the border with strong loam and bone-meal.

ROSES: C. R. T. Probably, water has been allowed to remain on the flowers, or syringing was done when the sun was shining.

SEEDLING CARNATION: A *Constant Reader*. Your Carnation has many desirable properties. The two most important ones are a non-splitting calyx, and the fine scarlet colour possessed by the flowers. It would be better were it a little larger and more full, but for ordinary purposes the flowers are capital. Reply, as to leaf, next week. C. W. sends a very similar seedling, but not so good.

SEEDLING PELARGONIUM: F. G. E. B. The flowers you send are of good quality generally, and the trusses are large. Evidently they have been well grown, but apart from this, though the colours are good, we are of opinion that they are not equal to many existing varieties in regard to the size or form of the individual flowers.

VALUES: J. K. E. The prices depend on size, beauty, and general conditions, and also the fancy of the purchaser.

VINE LEAVES: G. T., and H. K. Warts on the leaves are generally the result of too much moisture and deficient ventilation.

VIOLAS AND PANSIES: *Dobbie & Co.* A very nice selection of blooms in numerous colours, but to make sure what these plants are fit for, and how they look when planted out, it is not of much use to inspect single blooms—not the worst we may be sure. It is necessary to inspect them as plants growing in the open air, in clumps, buds, or masses.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of more than 90 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preferred for reference in all the principal Libraries.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, 48; Half Page, 44 10s.; Column, 43.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

### SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

## The BEST LAWN MOWERS

ARE THE "INVINCIBLE" AND The "VICTOR."

EDWARDS' PATENT

Winner of the Gold Medal at the National Lawn Mower Contest. A Customer writes:—"Dear Sirs,—I am pleased to say that the 24 inch works as well as ever it did. As you know, it was bought in 1874—that's a long time for a machine. I am open to back it now against any machine in the county, long or short, wet or dry, against any other machine of different makers."

Send for Last Free from Sole Makers—**JOHN CROWLEY & CO., Limited, SHEFFIELD.**

## ROBERT WARNER & CO.'S NEW PATENT WINDMILLS.

Prices from £17, including Pump and Timber Supports. May 27, 1893, The Dell, Englefield Green, Surrey.

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C. Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sill geared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder. R. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne.

## THOMSON'S VINE AND PLANT MANURE.

The very best for all purposes. The result of many years' experience. Largely used both at home and abroad.

Agent for London:—J. GEORGE, 14, Redgrave Road Putney, S.W. Agent for Channel Islands:—J. H. PARSONS, Market Place, Guernsey. Sole Makers:—W.M. THOMSON AND SONS, LTD., Tweed Vineyard, Clovenfords, N.B.

Price Lists and Testimonials on application. Analysis sent with orders of 3-cwt. and upwards. SOLD BY ALL SEEDSMEN.

## STANDEN'S MANURE.

ESTABLISHED OVER 30 YEARS. Exceeds all others in General Fertilising Properties and Staying Powers.

It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell. The highly fertilising properties of this Manure render it money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

### ESTATE SALES.

The Best County Medium for Advertising Sales of Estates.

## THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Hooks, and other property advertised in the columns of the "HERALD."

### Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

### Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

### Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

|  | Range of Hothouses at Waterpark, Castle Connel, Ireland.  |

WATER SUPPLY!! — WATER SUPPLY!!!

SEND FOR ILLUSTRATED LIST, No. 27, OF

## JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For RAISING WATER for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from 300 to 500,000 gallons per day. Will force to a height of 800 feet.

FIG. A.—This ram lifts part of the same water that works it. (Engraved from Photo. of Ram which raises 250,000 gallons per day of 24 hours to medium heights, with good working fall.)

This View represents a Ram worked by impure river water, whilst pumping pure water from a well or spring and forcing it to a small reservoir on the hill, at an elevation of 532 ft., and a distance of one mile, from which reservoir the water is gravitated for fire-extinguishing and general requirements of mansion, stables, farm, and village.

FIG. B.—This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

### TESTIMONIALS.

From T. FERNYHOUGH, Esq., Agent to the RIGHT HON. LORD HINDLIP, Braley, Ashbourne, Derby. March 17, 1894.

DEAR SIR,—Referring to the two Patent "B" Rams you started six months ago for the Right Hon. Lord Hindlip, on the Alop-en-le-Dale Estate, I am glad to congratulate you on the success of your attempt to raise the necessary supply of water under conditions so difficult, the height to raise the water being more than 63 times that of the working fall. The Rams are worked by water from the River Dove, with the small working fall of 8 ft. 3 ins., and issuing from the rocky bank close by is a copious stream of pure spring water, 8000 gallons per day of which the Rams force to a reservoir three-quarters of a mile distant, and at the extraordinary height of 523½ ft. above the Rams. The water is then gravitated from the reservoir to the several farms and houses on the estate, giving an ample supply to each, and still leaving a good overflow at the reservoir.

I am glad to add that the Rams lift more water than you promised, and seem to work with great ease and smoothness, notwithstanding the great elevation they force to.—Yours faithfully,  
T. FERNYHOUGH.

From the RIGHT HON. THE EARL OF HARROWBY, 44, Grosvenor Square, London. February 21, 1893.

I have pleasure in stating that the two Hydraulic Rams which you supplied and fixed for me last autumn, at Sandon, have proved so far most successful, and that the work gives every promise of durability, while the economy, compared with the former much smaller and intermittent supply by steam-pump, will be considerable.

With a fall of about 14 ft. from a previously-existing mill-pool, the Rams supply reservoirs 168 ft. above the brook whence the water is forced, through pipes 1½ miles in length. They sent up, as long as I required it, about 41,000 gallons per day. I now generally work the two Rams alternately (for a fortnight or so each), but can at any time work the two together, if the full supply of 41,000 gallons should be needed.

The business of this somewhat complicated water-supply was conducted by you with singular promptness and punctuality; and no local difficulties arose in the execution of the work, owing to the excellent and efficient men whom you sent from your works at Accrington.—I am, Sir, your very obedient servant,  
HARROWBY.

From T. DYNE STEEL, Esq., M.Inst.C.E., Past President South Wales Inst. of Engineers, Bank Chambers, Newport, Mon. April 24, 1891.

DEAR SIR,—In September of last year I applied to you for a Hydraulic Ram for the purposes of the Usk Waterworks, to be capable of raising 27,000 gallons per day, a height of 127 ft., with a working fall of driving water of 27 ft., and on your guaranteeing that performance, I gave you an order for the Ram. The machine you supplied has now been put to work, and I have much satisfaction in saying that it far and away exceeds in its performance my most sanguine expectations, and possibly yours also. I have just completed a series of exhaustive tests, with the following results:—Working fall of driving water, 30 ft.; vertical height raised, 127 ft.; length of rising main, 550 ft. from Ram to outflow; length of supply pipe 300 ft.; gallons per hour raised, 1,612; driving water used per hour, 8,136 gallons, showing the remarkable and gratifying result of 83 per cent. of efficiency. The tests were carefully made and repeated, the water measured and levels properly taken. Several trials were made, and I shall be glad to give any engineer interested in the subject facilities for repeating the tests at the spot. I may here state that for the rising main I used a large diameter of pipe, in order to reduce friction, with excellent effect.—Yours faithfully,  
T. DYNE STEEL.

From MARTIN CURTLER, Esq., Agent to the Right Hon. LADY NORTHWICK, Sansome Place, Worcester. Feb. 18, 1895.

I have great pleasure in informing you that the Hydraulic Ram which you put in for the Right Hon. Lady Northwick, at Northwick Park, last year, has worked, and is working, most satisfactorily. The water, as you know, had to be raised to the height of nearly 400 ft., with 1,900 yards of rising main pipe, to a large tank on the top of a hill, in order to supply several farms on the estate with water at a great cost.

The supply to the tank is most ample, and there is an adequate overflow left below the Ram. Altogether the work is a very great success.—Yours faithfully,  
MARTIN CURTLER.

JOHN BLAKE, Oxford Street Works, ACCRINGTON, LANCASHIRE.

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

**STRAWBERRY ROYAL SOVEREIGN** has again this year been awarded high honours for its splendid fruit, and thus for the third season, both at Shows and in the Market, proved itself the best. As a proof, great growers—Mr. J. Wood, Crockenhill, Mr. Sharp, Virginia Water, Mr. Kerr, Epom—have just purchased from us 25,000. We still have about that quantity and offer them at £1 per 1000; small pots, 20s. per 100; 8-inch pots, 30s. per 100.  
H. OANNELL AND SON'S, Swaleey, Kent.

**STREPTOCARPUS.—STREPTOCARPUS.**—Splendid strain, year-old plants, to flower soon, 12 for 1s. 6d.; 100 for 5s. Free on rail.—J. HUBERT GROGAN AND CO., Lallyway Nurseries, Worthing.

**LARGE PALMS & DECORATIVE PLANTS.** Immense Stock. All sizes up to 20 feet for Sale or Hire. Inspection Invited. Prices on Application.  
B. S. WILLIAMS AND SON, Victoria and Paradise Nurseries, Upper Holloway, London, N.

## For Present Sowing.

**SUTTON'S SUPERB POLYANTHUS.** Consisting exclusively of seed saved from large flowers of good form, handsome and varied in colour.  
Mr. R. T. B. Kerlake, Gardener to G. L. Matthews, Esq., says:—"The Polyanthus were simply magnificent, the varieties numerous, some a deep yellow, and some almost black. They were in bloom two months."  
Price of Seed, 1s. 6d. per packet, Post free.

SUTTON'S SEEDS GENUINE ONLY DIRECT FROM SUTTON AND SONS, THE ROYAL SEEDSMEN, READING.

**CARNATION SEED.**—Sow now for next year's bloom. Choicest English saved seed, 1s. 6d. to 2s. 6d. per packet. Send for Carnation Catalogue to—JAS. DOUGLAS, Great Bookham, Surrey.

**DICKSONS SPECIAL LAWN MANURE.** Composed of the best and most suitable materials for sustaining the finer Grasses. A moderate application will rapidly produce a rich growth of a beautiful dark-green colour. Priced circular on application.—DICKSONS, CHESTER.

**BEGONIAS** of the newest and most superb type, including many rare varieties, Double and Single, for Conservatory or Bedding. See R. R. Davis' Descriptive CATALOGUE, free. A handsome coloured plate of Six Double Varieties and a Treatise on Cultivation, free for 1s.  
B. R. DAVIS, Yeovil Nurseries, Yeovil, Somerset.

**JOHN NATHAN, Covent Garden Market,** is open to RECEIVE CONSIGNMENTS of strawberries, Peaches, Nectarines, Melons, Grapes, &c. Terms, 5 per Cent. References, London & County Bank, C. O. Branch. Sale accounts daily; cheques weekly. Telegrams: "Nuntiator, London."

The Sensation of the Century.  
**CROZY'S NEW FRENCH GLADIOLUS-FLOWERED DWARF CANNAS** produce gorgeous masses of brilliant colour, either in the flower garden or conservatory. Strong dry roots of best kinds. Free by Post, 9s., 12s., and 18s. per dozen.—B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, London, N.

**MORTIMER'S PRIZE MEDAL DAHLIAS.**—Strong, healthy plants of Show, Fancy, Cactus, and Pompon, in all the very best varieties, 4s. per dozen. CATALOGUES containing all the best novelties, on application.  
S. MORTIMER, Swiss Nursery, Farnham.

**KENT, THE GARDEN OF ENGLAND.**—GEOORGE BUNYARD & Co., The Royal Nurseries, Maidstone, are the largest growers and the best cultivators of fruit trees. CATALOGUE, six stamps. 800 kinds, true to name.

**THE BEST PEA for LATE SOWING** IS SHARPE'S QUEEN. Price 2s. per quart. Trade Price on application.  
CHARLES SHARPE AND CO., LIMITED, Sleaford.

Surplus Plants.  
**SOLANUM, "Weatherill's Strain."**—Strong plants, in large 60's, fit to pot into 48's, 12s. per 100.  
WILLIAM WHITELEY, The Nurseries, Hillingdon Heath, Uxbridge.

Hollyhocks.  
NOW IS THE TIME TO PLANT.  
**JOHN FRASER, The Nurseries, South Woodford, Essex,** offers a fine lot of HOLLYHOCKS, established in 48's. These are seedlings from named sorts, and are all named. If the seed is carefully saved they generally come true to name.  
A List of the sorts, with price, may be had on application.

**ALPINE, ROCK, and HERBACEOUS PLANTS.** Unique Collection. Catalogue Illustrated, Cultural Notes, on application.  
100 SAXIFRAGES and Dwarf PHLOX, 25s. per 100.  
STANFIELD BROTHERS, Southport.

**WANTED, specimen STEPHANOTIS FLO-RIBUNDA,** good variety for cash, or exchange for Odoatoglossum Crispum, imported plants of best type.—Particulars to DAVID W. THOMSON, 24, Frederick Street, Edinburgh.

**BARR'S SEEDS.—UNEQUALLED.** VEGETABLE SEEDS, best in the world for growth. FLOWER SEEDS.—Upwards of 2000 species and varieties. BULBS.—Gladioli, Lilies, Anemones, Ranunculus, Tigridias, &c. PLANTS.—Hardy Perennials and Alpines for beds, borders, rockwork, and to cut for vases and bouquets. DESCRIPTIVE CATALOGUES of above sent free on application.  
BARR AND SON, 12, King Street, Covent Garden, London.

**BOUARDIAS.**—Best named sorts, Cleveland, Mrs. R. Green, Vreelandi, &c., clean, well-rooted stuff, 10s. per 100, cash.  
CRANE AND CLARKE, The Nurseries, March, Cambs.

**NOW IS THE TIME TO PLANT GLADIOLI, DELPHINIUMS, PYRETHRUMS, & GAILLARDIAS.** Catalogue of KELWAY AND SON, Langport, Somerset.

Demy quarto, printed on fine paper ingres, gilt top. Price, £1 11s. 6d.  
**THE ART and PRACTICE of LANDSCAPE GARDENING.** By H. E. MILNER, A.M.I.C.E., F.L.S. With Etched Illustrations and Hand-coloured Plans. To be obtained from the Author, 7, Victoria Street, S.W.; or, from the Publishers, SIMPSON MARSHALL & CO., Ltd.

Seed Potatoes.

MR. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, May 6, at half-past 12 o'clock precisely. On view morning of Sale, and Catalogues had.

Wednesday Next, May 6.

71 Cases of LILIUM AURATUM, ALBUM, and others, in all about 8000 bulbs, just received from Japan. TREE CARNATIONS (all new varieties) 50 lots of POT ROSES, 50 lots of STOVE and GREENHOUSE FERNS, and ORNAMENTAL PLANTS, GLADIOLI LEMOINEI HYBRIDS, CALADIUM ESCULENTUM, extra choice BEGONIAS, HOLLYHOCKS, PRIMULAS, VIOLETS, LOBELIAS, VIOLAS, choice PINKS, CANNAS, CAMPANULAS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, May 6, at Twelve o'clock. On view morning of Sale, and Catalogues had.

Friday Next, May 8, 1896.

SALE OF ORCHIDS, by order of Messrs. F. SANDER & Co., St. Albans.

A GREAT VARIETY OF IMPORTED ORCHIDS, including many believed to be new. Also RARE AND CURIOUS ORCHIDS.

A consignment of the white and Roman red-flowered DENDROBIUM DRACONIS.

The rare and lovely DENDROBIUM SANGUINOLENTUM.

A DENDROBIUM SPECIES, very distinct. The old flower-spikes are upright, and the pseudo-bulbs have a very distinct appearance.

A CYPRIPEDIUM SPECIES; striking looking foliage.

GRAMMATOPHYLLUM MEASURSIANUM, flower marked with chocolate and purple borne on very long scapes.

DENDROBIUM SUAVISSIMUM. A few very fine plants.

DENDROBIUM CLAVATUM, DENDROBIUM FALCONERI, DENDROBIUM FORMOSUM GIGANTEUM. The very large flowered type.

DENDROBIUM DALHOUSIEANUM, among the largest-flowered and most stately-habited of all Dendrobies.

A CYMBIDIUM SPECIES from Upper Burma, plants in grand order, and the pseudo-bulbs bear a strong likeness to the imitable C. Traceyanum.

DENDROBIUM CRYSTALLINUM, D. DIXANTHUM, D. CAMBRIDGEANUM, D. PRIMULINUM, D. CREPIDATUM.

DENDROBIUM WARDIANUM GIGANTEUM, the gigantic-flowered Upper Burmese type. The finest of all.

D. INFUNDIBULUM, D. JAMESIANUM, D. PIERARDII, D. CRASSINODE, splendid plants, lotted to suit the Trade.

A CEGELOYNE SPECIES, with dark green bulbs; flowers white and orange-yellow.

CYPRIPEDIUM INSIGNE MONTANUM, a grand lot of plants, evincing great variety in the foliage and appearance; every probability of novel forms from among them.

AN EPIDENDRUM SPECIES, flowers said to be borne on long branching spikes, each flower nearly 2 inches across, lip rosy-purple and white.

DENDROBIUM NOBILE, LANG TANG VARIETY.—From the district which has yielded such grand forms as Amesiae Sanderi, Sanderianum, Ballianum, &c., &c. Cypripedium Curtisii, C. exul, &c., &c.

Also strong imported bulbs of an EUOHARIS SPECIES, probably E. grandiflora or E. subdentata.

Also 75 lots of ODONTOGLOSSUM HASTILABIUM (another property).

TO BE SOLD BY AUCTION BY

MESSRS. PROTHEROE AND MORRIS, at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, May 8, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

Tuesday, May 12.

SPECIAL SALE OF ORCHIDS IN FLOWER and BUD.

MESSRS. PROTHEROE AND MORRIS beg to announce that they will be holding a SPECIAL SALE OF ORCHIDS IN FLOWER and BUD, on TUESDAY, May 12, at half-past 12 o'clock, and will be glad to receive List for printing in Catalogue on or before Wednesday next, May 8.

Central Auction Rooms, 67 and 68, Cheapside, E.C.

Preliminary Notice.

HIGHLY IMPORTANT SALE

OF THE

ARDDARROCH COLLECTION

OF

ESTABLISHED CATTLEYAS.

By order of R. Brooman White, Esq., who is giving up the Cultivation of Hothouse Orchids.

MESSRS. PROTHEROE AND MORRIS have been favoured with instructions to SELL by AUCTION, on the Premises, Arddarroch, Garellochhead, Dumbartonshire, on TUESDAY and WEDNESDAY, June 9 and 10, at half-past 12 o'clock each day, the whole of the well-grown CATTLEYAS and LILIAS, and a few ODONTOGLOSSUMS in flower.

Fuller particulars will be given in future announcements,

Normandy, near Guildford, Surrey.

By order of the Trustees.

IMPORTANT SALE OF A HIGH-CLASS FRUIT GARDEN and NURSERY, with Possession.

MESSRS. PROTHEROE AND MORRIS in conjunction with Messrs. MUMFORD AND BOND, will SELL by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on WEDNESDAY, May 27, at 2 o'clock, at a low reserve, on balance an Estate, by order of the Trustees of J. P. Parrott, deceased, and Mr. Wm. Parrott, the productive MODEL FRUIT GARDEN and NURSERY, of 41 a. 3 r. 39 p., stocked with thousands of thriving young Fruit Trees of the highest grade, and in splendid condition; 16 modern Greenhouses, heated and fitted upon the best hot-water principles; ranges of newly-built Stables, Coach-houses, Van, Cart, and Store Sheds, Pigeries, &c. The soil is of the best quality, and there are 1500 feet of frontage to existing roads.

Particulars, Plan, and Conditions of the above, also the Farm and of the remainder of this Estate may be had on the Premises; at the principal hotels in the neighbourhood; at the Mart; of Messrs. J. & T. PARROTT, Solicitors, Aylesbury; of Messrs. MUMFORD AND BOND, Auctioneers, Brill, Bucks; and of Messrs. PROTHEROE AND MORRIS, Auctioneers, Valuers, and Estate Agents, 67 & 68, Cheapside, London, E.C.

Full particulars of PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C. (Folio 5814.)

SPECIAL SALE

OF

H. B. MAY'S

NEW TREE CARNATIONS,

On WEDNESDAY NEXT, May 6.

MESSRS. PROTHEROE AND MORRIS

will Offer, at their Sale Rooms, 67 & 68, Cheapside, London, E.C., a Grand Lot of these WINTER-FLOWERING CARNATIONS, which are undoubtedly the finest set of New Varieties ever offered, including—PRIMROSE DAY, the finest Yellow; W. ROBINSON, the finest Scarlet; HENRY GIBBONS, the finest Crimson; LEONIDAS, fine Crimson-Scarlet; and many other sorts of great merit.

Camden Road, N.—Brecknock Nursery.—To Florists,

NURSERYMEN, FRUITERS, and OTHERS.

MR. ALLAN BOOTH will SELL by AUCTION,

at the Mart, on THURSDAY, May 14, at 2 o'clock precisely, the valuable LEASEHOLD PREMISES, with the Goodwill of the Old-established Business known as the BRECKNOCK NURSERY, occupying a prominent corner position, with important frontages to the Camden and Brecknock Roads, and comprising an excellent Conservatory and Seed Shop. Lease about 4 1/2 years unexpired; ground-rent, £10; with possession. Also the Leasehold, Semi-detached RESIDENCE, known as No. 229, Camden Road, N., containing five bedrooms, dining and drawing-rooms, surgery, domestic offices, and small garden; let on lease to a responsible tenant, at the nominal rent of £25 per annum; and the erection of Stable, Coach-house, and Store in rear (occupied by the Brecknock Nursery), lease about 4 1/2 years unexpired, at a rent of £15 per annum. May be viewed by cards, to be obtained of the Auctioneers; particulars with plan, at the Mart; of C. H. T. WHARTON, Esq., Solicitor, 31, John Street, Bedford Bow, W.C.; and of Mr. ALLAN BOOTH, Auctioneer, Surveyor, &c., 4, Brecknock Road, Camden Road, N. (Telephone, No. 7761).

FRUIT and FLOWER GROWING ESTATE,

in best part of South of England, FOR SALE, as a going concern. Cucumber, Tomato, and Grape Houses of best construction, fitted with latest improvements—All particulars—GROWER, 95, Newland Road, Worthing, Sussex.

To Nurserymen and Florists commencing Business.

HAMPTON-ON-THAMES, on the Marling

Park Estate, free from London fogs, a deep rich loam, the favourite neighbourhood for Growers. FREEHOLD LAND for SALE on easy system of Purchase, or to be LET on Lease. For full particulars, apply to Mr. FREDK. G. HUGHES (Surveyor), the Estate Office, Hampton-on-Thames.

FLORIST'S BUSINESS FOR SALE.—Good

neighbourhood. Rent £32, partly let, private entrance. Same holds these years, only cause of selling wife's delicate health, ordered abroad. Thoroughly genuine.—Apply by letter, to P., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

FOR SALE, a small valuable long leasehold

NURSERY, 6 miles from Covent Garden. Seven large Greenhouses, well stocked; two Vineries, Cucumber-house, Plant-houses, five-roomed Cottage. Low Ground Rent. Lease eighty-six years to expire. Eighty-five feet Glass. Facing main road. All particulars of FLOEBIST, 11, Dafforne Road, Tooting, Surrey.

FOR SALE.—NURSERY and FLORIST'S

BUSINESS, doing good trade. One Acre of Land, 8 Glasshouses, 80 feet long, all Heated. Stocked. Ninety-nine years' Lease; 84 years to run.—Apply, R. B., 2, Bowen Villas, Wembley, Harrow, Middlesex.

FOR SALE, as a Going Concern, the SUTTON

NURSERY, situated at Duckmanton, near Chesterfield, Derbyshire. The contents of this Nursery have been reduced from 74 acres of the above to 27 acres or thereabouts, and it is held on a lease having about 18 years to run; while the Hothouses have been increased to 31, each 100 feet long, with six additional forcing sheds 100 feet by 33 feet, potting-house, office, and stables. Also a large number of frames and loose lights. The houses and heating arrangements are of the most modern description, and there is an ample supply of water. The stock consists largely of Roses, Fruit Trees, Rhubarb, &c.

The Manchester, Sheffield, and Lincolnshire, and the Lancashire, Derbyshire, and East Coast Railways pass close to the Nursery.

For particulars apply to Mr. WM. BRINING, Chartered Accountant, 19, Saltgate, Chesterfield; or, Mr. JARVIS W. BARBER, Chartered Accountant, George Street, Sheffield

Opportunity Seldom Met With.

## LETHORION (Vapour Cone) PATENT.

The total destruction of Insect Pests in Greenhouses is thoroughly secured without the slightest possible injury to Flowers or Plants of the tenderest kind. It CANNOT fail where the houses are secure. Red Spider, Scale, and Mealy Bug can be easily eradicated by doubling the Cone power.

PRICES: For frames, &c., of 50 to 100 ft., 6d.; 500 to 700 ft., 8d.; 1,000 to 1,500 ft., 1s.; 4,000 ft., 3s. 6d.

The public are cautioned against imitations in various forms at less cost, as they have in most instances proved to be worthless articles, totally unequal to Lethorion in strength and effect.

FITTED with PATENT AXLE SPRINGS.  
A GREAT BOON TO GARDENERS AND ALL USERS.  
The Best Work Combined with Ease in Working.  
NO SHAKING, EVEN on ROUGH GROUND.

MOWERS with Springs, for Horse, Pony, and Donkey Use.

HAND MACHINES, driven by Chain or Gear, and Fitted with Springs.

LORD'S CRICKET GROUND, LONDON, June 15, 1894.

I have used your Lawn Mowers for over twenty years, and have no fault to find with them. I consider them the best in the market, and they are the only Machines we use here. The addition of the springs to our 48-in. Mower is a great improvement, and the machine works with great ease and smoothness. I consider you have made a good hit.—Yours truly, (Signed) PERCY PEARCE, Ground Superintendent.

**THE "PENNSYLVANIA."**

ONE MONTH'S FREE TRIAL ALLOWED.

TESTIMONIAL—

"World's Columbian Exposition,  
Chicago, October 16, 1893.

"Gentlemen,—I desire to state that we have used the 'Pennsylvania' Lawn Mowers almost exclusively during the progress of the Fair, with the most satisfactory results. The ease in working them was remarkable, and they did more work than we supposed was possible for Lawn Mowers to accomplish. The appearance and condition of our lawns, in comparison with others, prove the high grade and superiority of these Lawn Mowers.—A. E. FARQUHAR, Executive Commissioner."

**NARCISSI AND THEIR ARTISTIC USE.**

WHILE fair in form as any Orchid or Lily of the tropics, the Narcissus is as much at home in our climate as the Kingcups in the marsh, and the Primroses in the wood. And when the wild Narcissus comes with these in the woods and orchards of Northern France and Southern England, it has also for companions the Violet and the Cowslip, hardiest children of the north, blooming in and near the still leafless woods.

And this clear fact should lead us to see that it is not only a garden flower we have here, but one which may give glorious beauty to our woods, and fields, and meadows, as well as to the pleasure-ground. Nothing can be more beautiful than Mr. Walker's way of growing Narcissi for market, or such handsome borders of them as Mr. Burbidge grows, and they are beautiful in all ways, but in a great many cases it may not be well to have many of them in the flower-garden, which we want to be full of summer and autumn flowers; and, therefore, we have to think of other ways of arranging them.

In our country in a great many places there is plenty of room to grow them in other ways than in the garden proper, and this not merely in country seats, but in farms and orchards and cool meadows. To chance growth in such places, we owe it already that many Narcissi or Daffodils which were lost to gardens in the period when hardy plants were wholly set aside for bedding plants have been preserved to us, at first probably in many cases thrown out with the garden refuse. In many places in Ireland and the west of England, Narcissi lost to the gardens have been found in old orchards and like places. If we plant groups of those kinds we have to spare in the grass, and any wave of fashion should, unhappily, affect the Narcissi in the garden, our descendants may find them faithful as native flowers in the grass long after the Barrs, and Burbidges, and Hartlands, and others, who have done so much for the flower in our own day, have left their Narcissus grounds for, let us hope, the Elysian fields.

There is scarcely a garden in the kingdom that is not disfigured by vain attempts to grow trees, shrubs, and flowers that are not really hardy, and it would often be much wiser to devote attention to things that are absolutely hardy in our country, like most Narcissi, to which the hardest winters make no difference, and, besides, we know from their distribution in Nature how fearless they are in this respect. Three months after our native kind has flowered in the weald of Sussex and in the woods or orchards of Normandy, many of its allies are beneath the snow in the mountain valleys of Europe, waiting till the summer sun melts the deep snow. On a high plateau in Auvergne we saw many acres in full bloom on July 16,

1894, and these high plateaux are much colder than our own country generally. Soils that are cool and stiff, and not favourable to a great variety of plants, suit Narcissi perfectly. On the cool mountain marshes and pastures, where the snow lies deep, the plant has abundance of moisture—one reason why it succeeds better in our cool soils. In any case it does so, and it is mostly on dry light soils that Narcissi fail to succeed. Light, sandy, or chalky soils in the south of England are, we should say, useless, and Narcissus culture on a large scale should not be attempted on such soils. We must not court failure; and however freely in some soils Narcissi grow in turf, there is no law clearer than that all plants will not grow in any one soil—and it is a mercy, too, for if all soils were alike, we should find gardens far more monotonous than they are now. Gardening is an art dealing with living things, and we cannot place these with as little thought as those who arrange shells, or coins, or plates. At the same time, we may be mistaken as to failures which now and then arise from other causes than the soil. I planted years ago some Bayonne Daffodils on the northern slope of a cool field, and thought the plants had perished, as so little was seen of them after the first year. Despairing of the slope, it was planted with Alder, a tree that grows in any soil or water. Years afterwards, walking one day through the Alders, I found the Bayonne Daffodil in perfect bloom. The roots had doubtless been weak, and taken time to recover.

If the soil be right, all that need be done in planting is to make two cuts with the spade, raise the sod, put a few bulbs beneath it, again turn the sod down, firmly trample it down, and leave them to take their own way ever afterwards. It will often be well to turn up all the sods at first so as to see the outline of the groups.

Eight years ago I planted many thousands of Narcissi in the grass, never doubting that I should succeed with them, but not expecting I should succeed nearly so well. They have thriven admirably, bloomed well and regularly; the flowers are large and handsome, and in most cases have not diminished in size. In open, rich, heavy bottoms, along hedgerows, in quite open loamy fields, in every position they have been tried. They are delightful seen near at hand, and also effective in the picture. The leaves ripen, disappear before mowing time, and do not in any way interfere with the farming. The harrowing and rolling of the fields in the spring hurt the leaves a little, but the plants are free from this near wood walks, by grass walks and open copses and lawns which abound in so many English country places. The great group of forms of our large native Daffodils gave good results; they thrive better, and the flowers are handsomer than those of the wild plant. The little Tenby Daffodil is very sturdy, pretty, and never fails us.

A delightful feature of Narcissus meadow-gardening is the way great groups follow each other in the fields. When the Star Narcissi begin to fade a little in their beauty, the Poet's follow.

As to the kinds we may naturalise with advantage, they are almost without limit, but generally it is better to take the great groups of the Star Narcissi, the Poet's, and the wild Daffodil, of which there are so many handsome varieties. We can be sure that these are hardy in our soils; and, moreover, as we have to do this kind of work in a bold and rather unsparing way, we must deal with kinds that are easiest to purchase. There is hardly any limit except

the one of rarity, and we must for the most part put our rare kinds in good garden-ground till they increase, though we have to count with the fact that in some cases Narcissi that will not thrive in the garden will do so in the grass of a meadow or orchard!

The fine distant effect of Narcissi in groups in the grass should not be forgotten. It is distinct from their effect in gardens, and it is most charming to see them reflect, as it were, the glory of the spring sun. It is not only their effect near at hand that charms us, but as we walk about we may see them in the distance in varying lights, sometimes through and beyond the leafless woods or copses. And there is nothing we have to fear in this charming work save the common sin—overdoing. To scatter Narcissi equally over the grass everywhere is to destroy all chance of repose, of relief, and of seeing them in the charming ways in which they often arrange themselves. It is almost as easy to plant in pretty ways as in ugly ways if we take the trouble to think of it. There are hints to be gathered in the way wild plants arrange themselves, and even in the sky. Often a small cloud passing in the sky will give a very good form for a group, and be instructive even in being closer and more solid towards its centre, as groups of Narcissi in the grass should often be. The regular garden way of setting things out is very necessary in the garden, but it will not do at all if we are to get the pictures we can get from Narcissi in the turf. Whatever we do, it is always necessary to keep open turf here and there among the groups; and in dealing with a wide lawn or a meadow, we should leave a large breadth quite free of flowers. Bearing all these things in mind, it may be said with confidence that no one who has not seen it well grown and happily placed in the wild garden knows what the Narcissus may do for our lawns and home landscapes. *Mr. Robinson's Paper, read at the Daffodil Conference, Regent's Park, 1896.*

## NEW OR NOTEWORTHY PLANTS.

### ERYTHRONIUM JOHNSONI, Bolander.\*

Messrs. WALLACE, of Colchester, showed, at the last meeting of the Royal Horticultural Society, some specimens of this very pretty new species, the flowers being of a lilac-rose colour. The general appearance is sufficiently shown in our illustration (fig. 83, p. 549), and the botanical details are given in the subjoined note by Dr. Bolander.

### DIACRIUM BICORNUTUM, Benth.

On boulders and tree stumps, which would otherwise be bare and unsightly objects about the Botanic Garden and the Government-House Grounds, clumps of this most lovely Virgin Mary Orchid have been planted, and are now in full blossom (March 23, 1896). The pure white flowers, with dotted and streaked lip and column base, fill the air with a delightful aroma, and these, massed together in profuse numbers, form a very effective sight, glistening in the sun as though covered with frost. We have a specimen which differs somewhat from the ordinary white in

\* *Erythronium Johnsoni*.—Corm  $1\frac{1}{2}$  to 2 inches long, thinly coated, new ones evidently produced by offshoots from the base of the corm. Scape 10 to 12 inches high, flower-buds  $1\frac{1}{2}$  inch long, segments  $1\frac{1}{2}$  inch long, acuminate, three inner segments appendaged or auricled. Leaves two, 5 to 6 inches long, lanceolate,  $1\frac{1}{2}$  inch wide, strongly mottled. Style  $\frac{3}{4}$  to  $1\frac{1}{2}$  inch long. Stigmas three, long and spreading. Anther  $\frac{3}{4}$  inch long, bright yellow; filaments shorter, dilated. Capsule oblong obovate, obtuse above. Colour a bright pinkish-rose outside, inside golden orange, deepening to a dark purple. Coast Ranges of Southern Oregon. May Collected by A. J. Johnson. H. N. Bolander, in *Erythra*, vol. iii., August, 1895, p. 127.

this respect, that its flowers are purple-tinted, and the lip divisions narrower. The flower-stems are dark-coloured throughout, and, in consequence, show up the white bracts distinctly, and thus it resembles *D. indivisum*. In the other the peduncles are green. The sheathing leaf-base has purplish lines, the white form green ones. *D. indivisum*, growing beside its ally, presents a miserable comparison; its puny white flowers are quickly followed by seed-pods. *D. bicornutum* is a feature of Government-House Grounds during the early months of the year, when its flowers expand in large numbers. *W. E. Broadway, Grenada B.H.I., April 1, 1896.*

## COSTA RICA AND ITS ORCHIDS.

COSTA RICA (as well as the other Central American States) is divided into two distinct climatic zones, one facing the Caribbean Sea, with a moderate rainfall during the whole year; the other, including the territory of the Pacific waters, has six months of nearly complete dryness, corresponding with the northern winter, from November to April, alternating with six months of rains. But even the rainy season is very pleasant, as almost every morning one enjoys delicious weather, with refreshing breezes, under a bright sunshine. Towards noon the increasing heat becomes moderated by accumulating clouds; and, between 2 and 4 o'clock, generally, a heavy thunderstorm cleanses the atmosphere, and the nights are at most times clear again and truly delightful.

The dry season of the Pacific slope is due to the trade-winds, under whose domination that section comes, when they are following the sun south. The trade-winds are always saturated with the vapours of the sea, which, when striking against the high Cordillera, condense into rain, and, after depositing here all its moisture, the air-current precipitates down and over the Pacific plains in the form of a violent dry storm; which, indeed, during the "verano," or dry season, is a daily occurrence on the Pacific slope. Now add to that, that during verano the trees partially lose their foliage, and you will find that most of the Epiphytes of the Pacific zone at that time of the year have to endure nearly the full light and strength of the tropical sun, as well as the violence of the dry and drying-up north-east storm, while their companions of the northern slope have less extremes to withstand.

From the above it follows that Orchids from the Pacific side of central America need during winter a very pronounced rest; while during the summer, or vegetating time, all without exception require a liberal supply of water, and a moist air, continually renewed by a thorough ventilation.

The temperature, depending on the altitude above sea-level, will be indicated with each species. The few sorts from the hot plains of the coast may require the east-Indian house or its cooler end; mountain-plants of about 3000 feet do best in the so-called Cattleya-house; and alpine sorts, from about 6000 feet, will prefer the cool or Odontoglossum-house.

Most of the Orchids, principally those with hard pseudo-bulbs, as Cattleyas, Lelias, most Epidendrums, Oncidiums, &c., generally delight and flower much more easily if grown in an abundance of light, protecting them only from the direct rays of sun.

Yet a word about a certain item which I consider of importance. I find that the different manuals on Orchid culture are advocating the use of water of the same temperature as the house. In view of that general practice, I wish to state the undeniable fact that, on the tropical highlands, where most of the Orchids are concentrated, rain-showers are ordinarily about 5° to 10° colder than the temperature of the air, slight hail being no rare occurrence at the altitude of 4000 feet and more. And a second fact is, that connoisseurs, judging from the colour and consistency of the roots, are quickly aware how the Epiphytes seek for such refreshments. I am far from pretending to show such authors, practical cultivators, and keen observers as are the Veitch's, the Williams', the Linden's, &c., how to grow Orchids; but some-

times one plan has proved to be good, while another may be still better; and just in that special point I wish to say: Try, and see. *R. Pfau*, "Orchids of Costa Rica," *San José, Costa Rica*.

**BACTERIA IN CARNATIONS.**

"BACTERIOSIS is a disease of the Carnation leaf, rarely attacking the stem or other parts of the plant. It generally starts in the leaf when immature, and is best diagnosed in the younger but full-sized leaves nearest the upper end of the stem. Taking such a leaf, which on its surface presents no unusual appearance to the eye, and holding it toward a strong light,

still clinging to the stem. Such spots never show distinct central darker coloured specks, and rarely any concentric circles, as do the spots made by parasitic fungi, such as *Septoria* (spot disease) and *Heterosporium* (fairy ring).

"Very badly diseased plants, especially when much crowded and growing in damp atmosphere, have more yellowish-green leaves than normal, of a more transparent appearance, and usually smaller. The lower leaves of diseased plants in any atmosphere or soil die prematurely, and the vitality of the plant is so lowered as to check the growth and decrease the size and number of the flowers."

It has always been an all-important question among Carnation growers as to how the various

cuticularised outer walls of the epidermis were often broken down, apparently the attack coming from within. However, this very rarely or never occurs in the fleshy-leaved varieties, and in any case would be especially rare under natural conditions.

"It is evident that after the bacteria fall upon the leaf, sufficient moisture must be present, so they may move about and find their way into the cavities of the stomata. A natural dew or artificial sprinkling will furnish the needed moisture. And so it is that plants in a greenhouse, where the air is kept moisture-laden, will show most disease.

"In both natural and artificial infection, the earliest indication of the disease is the appearance of translucent dots, which are found by microscopic examination to be always underneath stomata. These dots are scattered over the leaf, and are round until they coalesce with adjoining dots, and thus form dots or areas of irregular outline. It may be inferred from this that natural infection is usually through the stomatal openings.

"It was early found that it is difficult to introduce the disease into mature leaves, but that it readily attacks young and partly-grown leaves. From what has been stated, it is not difficult to give an explanation of this apparent preference. The cellulose walls of the stomatal air-cavities are easily penetrated in young leaves, but in mature leaves they have become incrustated with lime-salts deposited from the evaporating water, and are also somewhat changed chemically, making them less susceptible to the action of enzyme, and consequently almost impervious to the bacteria.

"The question might be asked, why other species of bacteria do not gain entrance to the tissues in this manner also, for it is a fact that the surface of the Carnation-leaf, and practically of all foliage, is infested with numbers of bacteria, and often of yeasts. In fact, in studying the disease, one of the most troublesome intruders into the cultures was *Bacillus subtilis*, commonly called hay bacterium, which seemed to be a constant inhabitant of the leaf surface. Other species appeared less regularly. The first reason for immunity against these surface and other bacteria is doubtless the acid reaction of the plant juices, for we have seen that in artificial cultures, acidifying the medium hindered or prevented the growth of other forms. The bacteria which find their way into the stomatal chambers therefore develop no further, on account of the acid sap. The resistance of the living protoplasm is doubtless another strong factor, preventing most germs from making any advances, even after gaining an entrance to the interior of the cell. And it may be that the secretion of a proper enzyme is lacking, although on this point we have no evidence.

"When the disease has progressed sufficiently to kill the cells, saprophytic bacteria and even fungi, are not slow to take possession and complete the work of destruction. This accounts for the fact that the lower leaves of a diseased plant often rot or mold far worse than of a healthy plant under same conditions.

"Besides gaining entrance to the plant through natural openings, the germs of bacteriosis may enter through insect punctures. The only insects that require attention in this connection are plant-lice (aphides). The common green-fly, or aphid, of the greenhouse, may in some instances prove such an efficient bearer of the contagion that every leaf on a plant may be inoculated at hundreds of points, and the whole plant be turned a sickly yellow by the growth of the bacteria in the tissues. It is evident that only in a neglected greenhouse will the disease be seriously spread by this means, for only in such would the aphid be allowed to flourish."

On the subject of varieties that are most susceptible to disease, it is stated:—"No varieties of the Carnation are exempt from the disease, but they differ much in susceptibility. The seat of this difference is chiefly in the vigour of the plant. Weakly varieties like Buttercup, Sunrise, and La Parité, are most affected, while seedlings are least affected. Poorly-grown plants are more affected than those well grown. Partly starved or stunted plants are specially liable to attack. It must be remembered

FIG. 83.—ERYTHRONIUM JOHNSONI: FLOWERS ROSY-LILAC. (SEE P. 548.)

small pellucid dots may be detected scattered irregularly through the leaf, sometimes having a faint yellowish colour which are the centres of infection. The appearance of the dots has a close resemblance to those of the oil glands in the leaves of the common St. John's-wort (*Hypericum perforatum*), a rather abundant weed, or in the leaves of the false Indigo (*Amorpha fruticosa*), a native shrub, except that they have no regular disposition. Sometimes the surface of the leaf is slightly raised over the dots, making watery pimples.

"After a time the surface of the leaf above the dots changes enough to indicate their presence, and finally shows a distinct spot. As the disease extends inside the leaf, the surface tissues dry, the internal tissues collapse, and whitish sunken spots appear. In some coloured varieties of Carnation the spots vary somewhat by being more or less reddish or purplish. As the spots increase in size the leaves wither,

diseases that attack the plant find an entrance through the epidermis. On this subject, the *Bulletin* states:—"Our study of the disease gives no evidence that the germs are able to effect an entrance through the cuticle of the host, by means of an enzymic perforation. On the contrary, they are dependent upon either natural openings (stomata) or accidental punctures (insect stings) to get inside the plant.

"The stomata (breathing pores) are the usual points of attack. Germs of the disease, which have been deposited upon the surfaces of the host by wind or rain, find their way through the opening between the guard-cells into the air-chamber beneath. Here they attach themselves to the walls or the surrounding parenchyma cells, and, dissolving a passage, gain entrance to the living tissues of the leaf. In artificial infection, using a large number of vigorous germs, it was found that with thin-leaved Pinks, not only the cellulose walls of the inner tissues, but the

in this connection, however, that plants of any degree of vigour may be essentially free from the disease because the foliage is kept dry, so that the germs cannot pass from the surfaces into the stomata, and aphids are absent. Susceptibility can only be shown where the conditions for the spread of the disease are present. But, on the other hand, if the conditions are particularly favourable to the disease, any plant, however vigorous, may succumb."

Regarding distribution, we are informed, "it is safe to say that it is common throughout Eastern North America; and furthermore, the indications are, that no locality in this wide region, where any considerable number of Carnation plants are grown, is entirely free from it. One may say that a marked characteristic of the disease is its universality."

#### METHODS FOR CONTROLLING THE DISEASE.

The knowledge that has been gained by studying the cause and nature of bacteriosis makes clear a rational means of controlling it. As soon as the way in which the germs found entrance into the plant was discovered, a method of keeping them out presented itself.

As there must be moisture upon the leaves sufficient to enable the bacteria to move about and enter the stomata, in order that they may gain access to the interior of the leaf, it is evident that keeping the foliage dry will prevent the disease. Putting this inference to a practical test, it proved to be well-founded. In applying the preventive upon a commercial scale, difficulties are at once encountered, chief of which are the advent of the red-spider when foliage is kept dry, and the inconvenience of keeping the soil wet without wetting the foliage. But these difficulties can be adjusted.

The development of a rational method of treating the Carnation was hastened by the increasing interest among florists in other Carnation diseases, and especially in Carnation rust, which first attracted attention in this country in 1891. This and other fungous diseases are much promoted by the presence of surface moisture; and a sparing use of water on the foliage is advocated in order to keep them severally in check. In the discussion which followed the reading of a paper on Rust before the American Carnation Society at Buffalo in 1892, it was apparent that a majority of the growers present believed that, if anything were to be gained by it, there would be no great difficulty in so watering a Carnation-house that the foliage could be kept practically dry, and yet free from red-spider. Although there was much diversity of opinion regarding details, yet the essential features were (1) to sprinkle from overhead at long intervals, say, once a week in spring and fall, and less frequently in winter and only on bright warm days, when there would be rapid evaporation, thus giving sufficient moisture for the foliage, and (2) to wet the soil by sending a stream of water along the surface of the ground between the rows, thus watering the roots without wetting the leaves. At no time should the plants be watered overhead, or sprayed, at such a time that the foliage will remain wet overnight.

An improvement upon this method would be to do all watering between the rows beneath the foliage, and to spray the foliage as much as necessary may require with a weak fungicide, such as one of the copper compounds. Bordeaux Mixture may be used, or ammoniacal copper carbonate.\* The latter is to be preferred, as it does not stain the foliage.

Keeping the foliage dry is in direct line with the natural requirements of the plant. The Carnation shows by its structure that it is adapted to a dry atmosphere. The thick, smooth leaves, the firm epidermis, and the waxy bloom that whitens the

surface, are all devices for conserving moisture. A fairly moist soil and a dry atmosphere are, therefore, the ideal requirements for the Carnation, as indicated by the structure of the plant; and the experience of the observant florist corroborates the deduction.

#### SUMMARY.

1. Bacteriosis of Carnations is a widespread disease of the Carnation plant, only recently recognized.
2. It is seated in the leaves, but affects the whole growth of the plant, and checks the production of flowers.
3. The disease is caused by parasitic bacteria entering the plant from the air through the stomata, or occasionally by the punctures of aphides.
4. The germ associated with the disease may be separated and shown by artificial infection of healthy plants to be the cause of the disease.
5. The germ will grow well at any temperature not inimical to the life of the Carnation plant.
6. The disease does not usually affect other Pinks beside the Carnation, but may be artificially transferred to several species.
7. Plants outside the Pink family will not contract the disease, naturally or artificially.
8. Any varieties of Carnation may be affected, but old and weak, or poorly-grown varieties, are most susceptible.
9. Plants may be kept essentially free from the disease by keeping the foliage dry and preventing the presence of aphides.
10. Watering a Carnation-house is to be done by directing the stream of water between the rows beneath wire netting arranged to support the foliage.
11. Overhead spraying is only to be done occasionally on bright days, and with water containing a small amount of ammoniacal copper carbonate. *J. C. Arthur and H. L. Bolley, in "Bulletin 59," Purdue University Agricultural Station.*

## ORCHID NOTES AND GLEANINGS.

### LÆLIA PURPURATA.

MESSRS. SANDER sends us a double flower with three sepals and two rows of petals, the latter all more or less lip-like (peloriate). The column, as is usual in such cases, is straight, with a normal anther, and with one of the styles partly separate and projecting like a horn from the front of the column.

### ODONTOGLOSSUM EGREGIUM.

Mr. R. Brooman White writes that from some mischance, a plant of this species was awarded an Award of Merit under the name of *O. Andersonianum*, Ardaroeh variety, at the last meeting of the Royal Horticultural Society. It is desirable that the mistake be rectified, as Mr. White has a fine variety of *O. Andersonianum* which he calls Ardaroeh variety, while the true *O. egregium* was given a First-class Certificate in 1859.

### VARIOUS ORCHIDS.

From Mr. H. Bailey, The Briars, Reigate, comes a photograph of a plant of *Leptotes* bicolor bearing twenty-six flowers. It is a nice well-grown plant.

Dr. Billingham sends from Stedham Hall, Midhurst, a photograph of a plant of *Trichopilia suavis*, which made a grand show in his house this spring. There were six spikes bearing eighteen flowers in all, the leaves, thick and leathery, measured about 13 inches long, by 4 inches in width, and the blossoms were 3 inches long, with a beautiful fringed lip.

From Mr. Bond, The Gardens, Manor House, Bathford, came a photograph of a fine specimen of *Dendrobium thyrsiflorum*. These photographs were hardly suitable for reproduction; moreover, the plants have been already figured.

## RAISING SEEDLING FLORISTS' FLOWERS.

THE remarks at p. 524, on the raising of seedling Auriculas, seem to prompt a response from some practical florist. This being the time of the Auricula,

a few remarks on that spring favourite may be useful. Referring again to the editorial remarks at p. 524, if I understand them aright, it is possible that exception might be taken to the following:—"The gardener, "in his attempt to raise new and improved forms, has been working on the same lines as are operative under natural conditions." On the same lines truly, but the conditions are different. I stated in a few notes the other day that the laced Polyanthus, as it is termed, had not been improved in any way during the last thirty years, notwithstanding that able men had been trying hard at the art of cross-fertilisation in recent years. The late Mr. Samuel Barlow has been mentioned as one; but even the Midland florists did not admit that his seedlings were improvements on the old sorts, and their constitution was so bad, that they could not stand ordinary propagation. I have also watched the new laced Polyanthuses exhibited in the North of England for some twenty years; but no seedlings stand out prominently as rivals to varieties cultivated fifty years ago. Most likely the florists are working on the "lines as are operative under natural conditions." Nature does not remove the anthers from the seed-bearer before the pollen is scattered, and unless this is done, cross-fertilisation cannot be effected, for no florists' Polyanthus can be "pin-eyed;" that is, with the stigma protruding from the eye, and the anthers lower down in the tube of the flower. A pin-eyed flower may be cross-fertilised without removing the anthers; a "thrum-eyed" flower cannot; and unless the would-be producer of new Polyanthuses and new Auriculas will take pains to remove the anthers from the seed-bearer in time, so that the very best named varieties are really cross-fertilised, he cannot hope for success. I have several hundreds of seedlings from good laced varieties, but the seed was from flowers saved without the manipulation detailed above, and I do not find a good variety amongst them—a few as good as the parents, but none better.

I have worked on the Auricula for twenty-five years, and have had what may be considered good results, as I have raised some standard varieties in all the classes. I have frequently consulted the Rev. F. D. Horner, who may be considered the most successful raiser of seedling Auriculas of high-class quality. He, like myself and other raisers, has learned much by experience. When we first started, it was not thought worth while to cross-fertilise the selfs, as it was so easy to get selfs amongst seedlings of the green, grey, and white-edged varieties; but we found that selfs so produced were never up to the standard of excellence of the named selfs, and the only chance to get selfs up to the highest standard of excellence was to choose the best varieties in that class, and cross-fertilise them. The seedling-raiser chooses green-edged flowers to cross with the best in this class, and the same all through, white edge with white edge, grey with grey. Notwithstanding that the greatest care is taken, the results are most astonishing until one gets accustomed to them. Out of 1000 seedlings of the best crosses, I have had one variety only worth keeping as a florist's flower; some 50 per cent. of the seedlings were selfs, fancies, or some such erratic productions; as Mr. Horner aptly remarked to me, "that they were amusing in their absurdity." All the curious fancies seen at flower-shows have been produced from edged varieties, and the largest number I ever obtained in one year was from a cross in which John Simonite was the seed-bearer.

Some ten years ago (1886), when the first Auricula and Primula Conference was held, the late Mr. Shirley Hibberd stated in a paper read at the Conference, that the show Auricula (garden varieties of *Primula Auricula*) would not cross fertilise with the garden varieties of *P. pubescens*, alpine Auricula, he having tried the experiment. No one seemed prepared to traverse this assertion at the time, but since that, it has been found by actual experiment that they will cross, at least, with the edged show varieties as the seed-bearer. I flowered about fifty plants from a green-edged show Auricula crossed with pollen

\* The ammoniacal copper carbonate is prepared by adding enough water to 5 oz. of copper carbonate in a wooden pail to make a thick paste. Then add enough ammonia (about 3 pints) to fully dissolve the copper. This may be kept in a tightly-stoppered bottle as a stock solution, and a little added to the water at each sprinkling. It should be diluted about 100 times, that is, the formula will make about 50 gallons of an ordinary strength fungicide.

from one of my seedling alpiners, and a curious progeny is the result. There are three or four pretty garden varieties amongst them which the fanciers will speedily relegate to the "fancy" class. Their hybrid origin is easily traced by examining the centre, which in the show Auricula is pure white, densely coated with farina; but in the alpine, yellow or cream, and destitute of farina. In the seedling forms the centres are all yellowish and lightly coated with farina; some of them also show attempts to establish a green or grey margin, but one more like the margins of 200 years ago than those of the present day. I wish some raisers of seedling Polyanthus and Auriculas would give their experience; some interesting information would, I am sure, be forthcoming. *J. Douglas.*

## FLORISTS' FLOWERS.

### THE CARNATION.

THIS flower at the present time seems to be the most popular of florists' flowers, and the older cultivators are overwhelmed with questions from beginners anxious to succeed in the culture of the plants. It is difficult to impress upon this class of amateurs that the cultural details are simple, and such that one may easily learn if he have enthusiasm. During the last year or two I have been enabled to note the results of early and late potting and planting. I last year planted as late as November, and I have been filling a large bed at intervals during the present season, and I can say certainly that the latest planted look the best, which may be due to the fact of no check whatever being given them. They are well inured to the open air before planting, and carefully turned out of the pots. It is quite feasible if plants have careful attention during the winter and they are kept in frames, that they will be in better condition than when exposed during the winter. The great point is to avoid coddling the plants when in frames, and to afford protection only against heavy rain, snow, and severe frosts. Plants treated in this manner are in condition, fitting them to be placed out-of-doors at any time during the spring. Those plants which have been protected in frames since they were re-potted may now be placed out-of-doors on a hard bed of coal-ashes or similar material, putting a stick to each plant, in order to prevent injuring them by wind, which is apt to cause the plant to snap off close to the ground. The potting should be finished with all speed, and no plants should be purchased that are not established in small flower-pots. To lift layers from the open ground in the spring is to court failure, for such plants spindle rapidly for bloom, and the roots do not move freely enough to support the flower-buds, the result being weak stems, and a few flowers of poor quality.

Seedlings of Carnations will now claim attention. I sowed, in the last week in March, seeds of a large number of varieties, and the seed leaves of the plants are developed, and the plants ready to be pricked out into boxes or cold frames. Seedlings when pricked out should stand 3 inches apart. With good culture these will make strong plants fit for planting out in the month of July. In raising seedlings, few amateurs give a thought to the right time of the year for sowing the seed and planting out the seedlings. The best time to sow is towards the end of March or in April, which gives time for the plants to become well established before the growing season comes to an end; and strong enough to produce the wealth of bloom which astonishes those who have known the Carnation only as a plant propagated from layers or cuttings. Cuttings or slips of Tree Carnations should be put in to succeed those that were struck in February and March, but late cuttings do not produce plants that will flower before the spring; the earliest will flower in autumn and winter.

### THE PINK.

This relative of the Carnation deserves as much regard as the latter, and it ought to become a favourite, either forced or grown in the open borders.

During the months of April and May the varieties that bear forcing are delightful objects in the greenhouse, especially those with white flowers, of which I take Snowflake to be the best. Some long years ago a pretty little kind named Lady Blanche was a popular variety, but it degenerated rapidly, and is seldom met with in cultivation. Pink cuttings or slips should now be taken, and if they are rooted during the present month or early in May, strong plants will be obtained by the end of the season. Seedlings should be planted out in the open garden about the end of May in good soil in an open position; they will then grow rapidly, and develop into good specimens large enough to be potted into 6-inch pots in September. The plants soon fill the pots with fine fibrous roots, and are then ready for being forced at intervals during the winter and spring. Pinks dislike even more than the Rose a close stuffy atmosphere, or being placed far from the roof-glass. I have never had the advantage of specially-constructed forcing houses, but have been obliged to force my Pinks, Roses, Lilacs, and other things in early vivaries or Peach-houses, and have had to raise the plants on stages placed over hot-water pipes, near the fronts of the houses. The flower-stems of Pinks out-of-doors are now pushing up; and to make the beds, &c., neat and tidy they should be hoed and raked, and neat sticks placed to the plants. Slugs and the leather-coated grubs may want looking after when feeding at night.

### THE AURICULA.

I wrote of the Auricula at p. 371 of the present volume, that is, at a time when the trusses of bloom were becoming visible, and, owing to the previous mild weather, that early bloom was expected. But we were out in our calculations, for my best blooms were not open on the date of the Auricula show, and Mr. H. Turner informed me that the Alpine Auriculas at Slough were not in on April 21. Still the florists from various parts of the country were able to show fine collections, which, on April 21, formed in the aggregate one of the best exhibitions ever held by the Auricula Society. As soon as possible the plants should be put into a cold frame placed on the north side of a wall, a matter which should be especially attended to in the South of England. In the North, this does not so much matter; and Mr. Simonite, who lives at Sheffield, has a very fine collection, which it is not necessary to remove to a spot outside the Auricula-house, but that condition of things arises more from the smoky atmosphere than anything else. The lights should be removed from the frames as soon as it is possible to do so, replacing them if there is much rain. The re-potting of the plants should have attention as soon as convenient, using good yellow loam four parts, one part decayed manure, and one part leaf-mould. Before re-potting, remove all decayed matter from the roots, and brush off the woolly aphid which often clusters round the neck of the plants.

Seedling Auriculas should be pricked off and grown on as freely as possible in order to obtain good flowering plants within the year, the entire season being required by an Auricula to produce a flowering specimen. The plants, even in summer, ought not to receive too much water.

### THE POLYANTHUS.

The laced Polyanthus stands first as the type of the florist's section. I notice at p. 486, that "R. D." complains of this section being struck out of the schedule of the National Auricula Society, and adds that because no prizes are offered for them, "any encouragement to raise new varieties by means of seed is removed." Surely "R. D." must be aware that the Auricula and Primula Society would give awards to laced Polyanthus in the form of Certificates if they were new and good enough; but it is a fact that prizes have been offered by the society for twenty years, the result, as far as raising new varieties is concerned, being fruitless. But it is all a matter of money. If Polyanthus fanciers wish prizes to be given, they ought to provide the funds for that purpose. Something had to be done to meet a yearly

deficit, and as the laced Polyanthus seemed to be of poorer quality year by year, the committee decided to leave this section out.

It is of little use for "R. D." or anyone else, to enter protests, unless they back them up with subscriptions. The laced Polyanthus is really a northern flower, and is exhibited splendidly every year at the great spring flower-show held at Newcastle-upon-Tyne, and the old varieties which were in existence sixty years ago are still cultivated; prizes are offered for seedlings, and the growers produce new varieties year after year, but very few of them possess the requisite properties which entitle them to be placed with George the Fourth (Buck), Exile (Crownshaw), Cheshire Favourite, Lancar (Bullock), and other old sorts. Their names are not legion, for I do not think there are more than ten good varieties in existence. The fancy varieties are all very pretty, but they are easily grown, and are superior to the laced sorts for garden purposes.

It is now quite time the seed was sown for next season's crop. The seedling laced varieties never grow so strongly as the border kinds, and almost seem by their habit of growth as if they had been derived in the first place from a distinct parentage.

I have turned to Rea's *Flora*, published in 1876, and at p. 148, the variable scarlet or orange-coloured Cowslip is described in a way that would lead one to the conclusion that this is the parent of the laced Polyanthus. "It has," says Rea, "many small flowers on one stalk, which towards the bottom on the upper side in some are of a fine orange colour, and the leaves lifted about the edges with cinnamon colour, and something redder on the outside; some are of a fine scarlet colour, deeper or lighter in great variety." *J. Douglas.*

### FEEDING ASPARAGUS.

If the crop of this vegetable be deficient in quality or quantity, it is just as likely to be the result of over-feeding or untimely feeding as from insufficient food. I have seen excellent crops on land containing little manure, but what food was supplied was given at the right moment when the plant could absorb the nutriment. Heavy applications of manures in autumn are fatal to many plants, especially in heavy or wet land. As in the case of Asparagus, this is often accompanied by liberal dressings of salt, the plants have a great difficulty in living through the winter. Many roots actually decay from this cause, and the result is poor grass and weak plants. In the case of other vegetables, we do not apply food when the crop is cleared or the plant is at rest. It is impossible to obtain good results by such treatment; the plants being at rest cannot absorb the food to advantage. I am aware that to a certain extent the roots are active, but not sufficiently so as to require large quantities of food. The crowns, or portion of the stem which produces the heads, are formed during the previous season, and when these are forming is the time to apply food. If Asparagus is forced, the growth obtained is in comparison to the strength of the crowns and the condition of the roots, and no amount of food given during the forcing would increase its bulk or add to its quality. As to manuring, a few words will suffice to point out the value of summer dressings from May to September, and if plenty of food is given at that season there will be much better grass. The time named, however, is a busy season, and the Asparagus-beds after cutting are often left to look after themselves. In many gardens labour is none too plentiful, and the beds are left till late in the autumn. With a free top-growth, it may be asked, how can foods be best applied? Liquid-manure is one of the best manurial agents during the summer months. If the beds can be irrigated or flooded, say fortnightly, or even monthly, with liquid from stable-yards, it is invaluable, and there is no better season to apply salt than from May to the end of August. It gives the saline matter necessary to the plants, and it checks the growth of weeds, which thrive so freely in well-manured land. Salt applied in late autumn in my opinion does more harm than is

magned; it kills weak plants, keeps the ground cold and wet, and causes a late growth. Applied, say, once a month during the summer, it is beneficial, and I prefer to wash it down to the roots by copious supplies of moisture. Liquid manure from animals possesses much saline matter. Fish manure is one of the best summer fertilisers I have tried; and given at two or three dates at about three weeks' interval and plenty of moisture after, it gives much strength to the newly-forming crowns. The same remarks apply to dressings of guano given in showery weather at times during growth if given in small quantities. It may be asked, what time is manure to be applied to the surface of the beds? and I advise in the early part of the summer. It then serves a double purpose: it prevents the drying of the beds, and if water is given freely, it is soon washed down to the roots, but it should be thoroughly decayed. It is of great help in retaining the foods advised above; if the soil is shallow, heavy dressings are not necessary if the food above is given, and in all cases where practicable I advise growing the plants on the flat. *G. Wythes.*

## METHODS OF PROPAGATION.

(Continued from p. 432.)

In the spring there is much to be done in the garden among fruit-trees, and it is necessary that the operations of grafting be completed in good time—in fact, it is one of the chief elements of success. The Mahaleb stock for Cherries is seldom used except for dwarf or pyramidal trees grown in gardens or orchard-houses, and the usual method is to bud these stocks, as will be mentioned under its proper heading. When Mahaleb stocks are grafted, they are worked low down the same, as on the common stock.

### PEARS.

We will now take this, for which important fruit there are three kinds of stocks used, only two of which, however, are in general use—the Wild Pear and the Quince, the other being the Whitethorn (*Crataegus Oxyacantha*), which is used as a dwarfing stock for some varieties of strong growths; but it is seldom entirely satisfactory, as, sooner or later, the graft grows too vigorously for the stock, and is liable to push itself off, or be detached by the wind. It is better to adopt Mr. Rivers' plan, and double-graft such kinds, which method I will touch upon presently.

It frequently happens, however, in gardens that there are Pear trees of little or no use, either because the soil does not suit them, or they are not of desirable varieties. If the tree be grown as an espalier, or is trained on a wall, each tier of branches may be utilised to carry a different variety, the method of grafting being the same for all.

With a fine-toothed pruning saw, cut through the branch at right angles to its axis, and finish off smoothly with a knife, then proceed to cleft-graft. To do this, a piece of the wood should be removed by two diagonal cuts, forming an acute triangular incision, being careful to cut the bark cleanly, and not to bruise it, this cleft being for an ordinary branch,  $\frac{1}{2}$  inch deep at its base, diminishing to a point at the opposite acute angle. Now take your scion, and with two clean cuts shape its base so as to fit accurately the cleft in the branch, taking every care that the edge of the barks of the stock and scion accurately coincide, for reasons before stated; bind tightly with Raffia or other tying material, and finally put clay or grafting-wax over the tie.

Having frequently recommended the use of this wax, it may be useful if I give a simple receipt for making it. Take common resin, often improperly called "rosin," and to each pound, add 2 oz. of the best Russian tallow, melt these substances in an earthen pipkin, or old iron saucepan, over a slow fire, keeping them well stirred. When the mixture has boiled up, pour it out on a flat stone or slate, and when cool enough to handle, divide it into four portions, which for convenient use may be rolled by the hands into balls, and it is ready for use at any time, merely

requiring to be rendered soft by warmth, so that it can be applied to the tied graft with a stick and finished off by the fingers, which may be protected by dipping them into water. The lumps of wax should be moulded to a point, as directed for the clay or "pug." When it is necessary to remove the wax, a few sharp taps with the butt of the pruning-knife will cause it to fall away, and the tie beneath can then be loosened or removed.

Standard and pyramidal trees can be re-grafted in the same manner, but it is not advisable to put many varieties on these, but to confine the selection to one or two that are of good quality and free bearers. Young trees can be raised in private gardens by planting out a few Pear or Quince stocks, and grafting or budding these when of a sufficiently large size, but the gardener or amateur must avoid multiplying local sorts to any great extent, it being far better to get scions of well-known and tested varieties suitable to the climate and soil of the district from a nurseryman. Those of my readers who took an active part in the Pear Conference know well what an Herculean task it was to weed out useless local varieties, and there is little doubt that we still possess too many varieties.

As a lecturer on fruit culture, I have often had this experience: when I had finished the lecture, and had got through the cross-examination by some of the audience, I would be button-holed by some patriarch of the village, "Please, sir, what could you be thinking of not to give (naming some local Apples or Pears) a place of honour in your list of best sorts for us to cultivate?" No arguments were of the least use in convincing my friend that the varieties I had scheduled were all improvements on those which he named. Alas! we are all too apt to regard our own particular geese as being swans; and gardeners are, as a rule, very conservative.

All kinds of Pears succeed on the Pear stock, and the graft or bud should be put low down on the stock, to form either pyramids, espaliers, or standards. But there are some few varieties which do not succeed on the Quince stock, and these must be double grafted; that is, the first graft should be of a variety which unites well with the Quince, and this should be budded or grafted when large enough with the desired variety. These are the varieties of Pears which do not thrive on the Quince stock when grafted or budded direct upon it, viz., Clapp's Favourite, Duchesse de Bordeaux, Jargonelle, Marie Louise, Marie Benoist, Passe Crassane, Thomson's, Souvenir du Congrès, and Triomphe de Vienne. For these, put a free, clean-growing variety on to the Quince, as Beurré Hardy or Williams' Bou Chrétien. The following summer, most of these first grafts will be ready for budding, or grafts may be put on the next year in March. This kind of treatment ensures the formation of handsome and fertile pyramids, bushes, and espalier trees; and also may be adapted for either single and double cordons, on which fine fruit fit for exhibition may be produced. *Experience.*

(To be continued.)

## NOTES FROM THE ROYAL BOTANIC, MANCHESTER.

In the sunken grassy parterre adjoining the Exhibition-house the display of Tulips is very grand, and it is rendered the more effective by the scroll designs in which they are planted. The colouring is brilliant in the extreme, and on a day such as the show-day of the National Aricula Society, so bright, sunny, and beautiful, the floral emblazonry set in the beautiful emerald turf was eye-pleasing in the highest degree. Crimson was represented in solid mass by Crimson King, yellow by Chrysolora, a soft but decided lemon; La Reine is good pinkish-white; L'Inmaculata, Pottbakker, Gloria Solis, and Tournesol were admirable; Tournesol particularly, with its orange and scarlet double flowers, are far more telling out-of-doors in point of colour and size of flowers than when grown indoors. The example of a mixed assortment told well because of its lesser formality, the white, the purple, the crimson, the yellow, and the

piebald colours going well together, separated in a circular design by kinds of the variegated Phalaris, a dwarf "Lady-grass," which is kept knifed under for better variegation, and that, too, to some purpose. The dwarf tufty *Armeria Lauchea* is one of the best of our maritime *Armerias* for forming, as it is doing in one or more of the beds here, a sort of tufted fringe round the more brilliant-flowered Tulips.

### THE SHOW-HOUSE IN THE MANCHESTER BOTANIC GARDENS.

The span-roofed show-house, designed by Mr. Bruce Findlay, detached from the general range, and kept for a show of bloom at all seasons, is now remarkably gay with *Rhododendrons*, *Azaleas*, and miscellaneous plants. The perfume from the Edgeworthi section and other *Sikkim Rhododendrons*, is pronounced and pleasing. *R. Dalhousieanum* is in fine flower, as are also many others. The collection here of *Azalea amœna* is a large one, and the fine empurpled blossoms crowded together have a grand and imposing effect. The beautiful white, sweet-scented *Rudgea macrophylla* is full of its porcupine-quill-like flowers, is a noble plant for stove conservatories—indispensable, too, in every botanic garden.

### THE BEST-FLAVOURED APPLES AND PEARS.

In common with others, I was much interested in the communication from the Secretary of the Royal Horticultural Society, in your issue of the 11th ult., with reference to the Council's decision to take advantage of Messrs. J. Veitch & Sons' offer to give prizes for the best-flavoured Apples and Pears at each of the Society's meetings during the year ending with this last meeting in June, 1897, the first exhibition taking place at the first meeting in July, 1896. Various attempts have been made in many of the gardening journals to arrive at some decision on this subject, with varying success, but as far as I know no tangible or authoritative record to which intending planters may refer with confidence has been established. The subject opened up by the offer of these prizes is more important, and with possibilities of far more reaching effects, than appears at first sight. On the commercial aspect of the growth of these two fruits (especially the Apple) an authoritative pronouncement, such as we may hope this will be, will render it quite inexcusable for any planter in the future to plant other than the best varieties in their season, as decided by this public special test, in which every characteristic point in relation to each variety will come clearly out by following the mode of judging by points as specified. The only important point not clearly enough brought out in my opinion being, the robust or otherwise nature of the growth of the varieties, and their free-cropping qualities, as obviously it would be unwise to plant many trees of any variety, however superior its quality may be, if it is proved to be a poor grower and shy fruiter; but these points, no doubt, as well as many other important ones, will be fully noted when the results are published in the *Journal* of the Society. The results of these experiments will be equally useful to the amateur and the professional gardener, "for then he who runs may read," and learn the best varieties to plant for use during the various seasons of the year. This, I am afraid, is more than the majority of us know now, with the bewildering number of names we have, and with scarcely any two authorities recommending the same.

The exhibition of Apples from Christmas until June will be specially important and useful, and ought to be closely followed and watched by those whose duty it is to supply the market or private tables with this fruit at this season of the year, when good-flavoured English Apples are scarce, and also very expensive.

Up to Christmas we are not wanting in splendid varieties of both Apples and Pears, and of the latter I fear we may not hope to be able to grow many worth eating after that date; but of Apples it is dis-

tinctly within our power to have them, and that of the highest flavour almost until the end of May and even later (Cockle's Pippin is now delicious with me). Indeed, under the most favourable and best conditions of picking, handling, and harvesting the fruit, I am firmly of opinion that we may span the year round with dessert Apples of the highest quality, grown within the confines of our own country. If the successful exhibitors at these meetings could be induced to impart information on the conditions of housing the fruit, as well as the time of picking, much useful

The usual way of dealing with a subject like this is to appoint a sub-committee selected from the Fruit Committee sitting at the time, and no doubt the fruit committee is large enough and strong enough in special knowledge and talent to deal with any subject that may come before it, and strong enough also to allow of a sub-committee being drafted without weakening it in any material degree. The objection that presents itself to me against the adoption of this method, is the danger of mixing up the judges too much, a different set, as it were, acting at

the subject, would be invaluable, and would stand out for years to come as a standard authority for the guidance of future grateful planters. *R. G.*

### DENDROBIUM × WIGANLÆ.

THIS pretty cross-bred Dendrobe (fig. 84), whose parents are *D. signatum* ♂ and *D. nobile* ♀, was exhibited by Mr. White, gardener to Sir Trevor Lawrence, Bart., at the last meeting of the Royal Horticultural Society, and previously by Sir F.

FIG. 84.—DENDROBIUM × WIGANLÆ.

information would be elicited. In my opinion, late Apples are more often than not gathered far too soon, and housed in structures too airy and dry. If sketches of the winning varieties (1st prizes only) could be published in the *Journal*, with the descriptive matter, a completeness and much added value would be given to the subject.

I should like to say a word on the subject of judging these classes. It is not known, of course, what system the Council will adopt, but as we may hope that growers from most counties will exhibit at one season or another, not so much with a view of taking a prize, but to show which varieties succeed best for dessert in the various counties in which the exhibitors live. Therefore, it is not unlikely that the exhibits on some occasions may be numerous, and the work of the judges most arduous.

each exhibition, thereby preventing that continuity of knowledge, as regards the points of excellence in the samples exhibited at the various meetings, and which I think is so necessary to retain in order to come to a right decision. I would suggest rather that a number of gentlemen willing to serve should be selected (for their special knowledge of the subject) to deal with the classes at each meeting, and at the end of the year these judges should be asked to give a report of their labours, with notes added to the 1st and 2nd prize samples, clearly defining their several points of excellence over other varieties exhibited, with other information which the judges, from impressions formed of the facts ascertained in the course of the exhibition, would be able to give. A report of this nature on a subject of so much importance, and furnished by gentlemen having special knowledge on

Wigan's gardener, who failed to secure an award owing to the plant being immature.

The flowers vary in colour from creamy-white to white tinged with pink; the lip is dark purple, with a yellow basal area. It is a flower of pleasing colour, that is likely in time to become a favourite with lovers of Orchids. Sir Trevor Lawrence's plant was the recipient of an Award of Merit.

### FORESTRY.

#### SOME DISEASES OF CONIFERS.

A REPORT on two parasitic diseases of trees which have recently appeared in Germany, was concluded in the March number of the *Zeitschrift für Forst und*

*Jagdweiser* for this year. This report, the first part of which was published in February, 1894, has been furnished by *Forst-assessor* Bohm, of Eberswalde, and deals with a parasite on *Thuja gigantea* and *Pseudo-Tsuga Douglasi* respectively.

The first of these diseases, *Pestalozzia funerea* on the *Thuja*, appears to have done considerable damage to experimental clumps of that tree in the North German forests. The spores of the fungus usually germinate at the base of a shoot or small branch, which turns brown and dies early in the summer, through the mycelium killing the bark and cambium layer. In cases where the bark of the parent stem is involved, this also perishes where the mycelium runs entirely round it, but on large branches the diseased portion forms a blister similar to that caused by the *Peziza* of the Larch. In the latter case, a cork layer is formed between the diseased and healthy portions, which sometimes effectually and permanently isolates the diseased part, and which eventually becomes covered by new growth. A characteristic feature of the disease is the continued growth of the shoot above the place of infection, which occurs when the branch is sufficiently thick to carry a proper supply of sap through the wood. The base of the living portion becomes swollen and thickened, owing to it appropriating the whole of the organised matter from the leaves, which, under ordinary conditions would be distributed through the tree. From the infected spots small pustules subsequently break through the rind, from which spore-masses grow out as long black threads many millimetres in length.

The disease on the Douglas Fir has been identified as the *Phoma abietina* of Hartig, whose ordinary host is the Silver Fir. As with the *Pestalozzia*, the first external evidence of this disease is afforded by the death of the young shoots, and by the bark of the stem turning brown in patches in June and July. The infection does not appear to take place through a wound, but usually at the base of a branch where the bark is wrinkled and fissured, and where the germinating spores find no great difficulty in pushing through the bark. Out of one small plantation closely examined, about thirteen per cent. of the trees had lost their leading shoots, while thousands of blisters were present on the bark. A curious point in connection with the disease is, that it appears confined to particular years, although this may not be confirmed by subsequent experience. Plantations badly affected in 1893 were almost free from the disease in the following year, and blisters on the stems were rapidly being covered by new wood. Herr Bohm considers that the exceptional heat and drought of 1893 may have occasioned an abnormal fruiting of the fungus, as a result of which the spores may have failed to find suitable conditions for germinating. Young plantations were the most affected, owing to the relatively greater loss of shoots and leaders, and it was observed that the strongest and most healthy trees were as often attacked as their weaker neighbours.

It is impossible to predict at present what effect the spread of these fungi may have upon the growth of their hosts. Probably the general effect over a large area may be very slight, and serious injury to the trees an exceptional occurrence at the worst. But the fact that these American introductions are liable to attack by the same parasites as those preying upon European trees, deserves special attention from intending planters of the former. *A. C. Forbes.*

## THE WEEK'S WORK.

### THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorset.*

**CATTLEYS.**—The best varieties of *Cattleya* *Eldorado*, and especially the variety *Wallisii*, which has pure white flowers with orange-yellow throat, and which is a very distinct form, with an agreeable perfume, as have most of them, are very desirable plants. These *Cattleyas* are forming new breaks, and they should be placed so as to hasten growth in the warmest division, and afforded a moderate amount of sunshine and a large amount of ventilation. Although the plants may be growing freely, much care will be

required in affording water, any excess of it at the root quickly causing the growths to decay. Water may be more freely applied when the flower-sheaths are seen to be pushing up with the young leaves, but the quantity should be gradually lessened as the blooms fade. The proper time to re-pot these plants is when growth is fully completed. Few *Cattleyas* are more appreciated at this season than the distinct looking *C. Lawrenceana*, and when a large specimen, as seen at Burford, with between seventy and eighty blooms open at one time, it is not easy to realise anything more brilliant, especially when seen with the diffused sunlight which comes through blinds of laths. After the flowers fade, the plants should be placed in the least warm part of the house, and be kept comparatively dry at the root, otherwise they may recommence to grow instead of taking a rest, which should be a long one. In resting the plant, the pseudo-bulbs should be allowed very steadily to shrivel. As soon as the new roots are observed to push out from the current season's growth, and the old ones to send out new rootlets, then is the time to re-pot the plants or afford them some fresh rooting-material. The plants of the lovely *C. Schroderae* will now be passing out of bloom in most garden collections, and should be similarly treated to *C. Lawrenceana*, until growth recommences. Plants of *C. Mossiae*, *C. Mendeli*, *C. Schilleriana*, *C. Skinneri*, *C. Walkeriana*, *Lælia purpurata*, *L. tenebrosa*, and the various *Cattleya* and *Lælia-Cattleya* crosses whose flower-spikes are pushing upward in the sheaths, will require rather more water at the root till the flowers expand, when until growth recommences a smaller quantity will suffice for the needs of the plants. The dwarf-growing *Lælia pumila* and its varieties, *L. Dayana* and *L. prestans*, will require less water at the root now that they are at rest, and towards the end of May they should be removed and suspended in a light position in the cool-house. *Cattleya Bowringiana* is a plant which should not be unduly excited into growth by heat and moisture, but kept comparatively cool, when, as a rule, its breaks will come away vigorously; and very little water is needed to maintain the pseudo-bulbs plump and fresh. As this species produces the greatest number of roots during the autumn, re-potting is best performed at that season. *C. citrina* having completed its growth is sending forth its handsome fragrant blooms; and it should be kept in a cool dry house, and afforded a limited quantity of water. Under this kind of treatment the flowers last a very long time.

**THE MEXICAN-HOUSE.**—Plants of *Vanda teres* which are showing for flower should be exposed to direct sunlight, and syringed overhead several times a day in warm weather. *V. Hookeriana*, in its full growth, as it will be mostly, will require a similar kind of treatment, and the south side of a hot moist stove is the most suitable place for the plant.

**THE INTERMEDIATE-HOUSE.**—*Brasso-Cattleya* (*Lælia*) *Lindleyana* grows freely when suspended close to the roof-glass in this house; and if it be found necessary it may now be supplied with fresh material. The plant succeeds when planted in pots well filled with peat and sphagnum and plenty of drainage. When making its growth, place it in a light position and afford copious waterings at long intervals of time. Plants of *Phaius Humblotii* that are now sending up their flower-spikes should be well-shaded, and freely supplied with water till the flowers have expanded. *Cypripedium superbies* (*Veitchii*), is a plant one often sees in a languishing condition, but it is now becoming better known, and it is found that hitherto it has been grown too hot. The coolest position available in the *Cattleya*-house is an excellent place for it. It may be noted here that the species will at no time stand the least amount of direct sunshine, even strong light sometimes causing stunting, and yellowing of the leaves. The same remarks apply to the now rare *C. Schlumieri*. In addition to the ordinary roof-shading, it is advisable to lay a piece of tissue-paper over these plants during bright sunshine. They require a thorough watering every two or three days, as on no account should the materials get in the least degree dry.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Burton-on-Trent.*

**GENERAL WORK.**—The chief work in this department should now consist in protecting the trees from frost when necessary, disbudging all superfluous shoots on established trees of Apricots, Peaches, and Nectarines, stopping all young shoots required for forming fruit-spurs on the Apricot-trees, and nailing or tying-in all growths required for extension or fruiting. Great care is necessary when nailing or

tying-in these tender shoots, in order not to bruise them, and all the ligatures used should be of sufficient length to allow of the proper swelling of the wood. The small shoots from the *Syringa*, or the *Snowberry-tree* (*Symphoricarpos racemosus*), if cut into lengths of 6 or 8 inches, placed over the young shoots, and the ends inserted beneath the older wood, provide a very simple and effective means of securing the young growths in their places, without any fear of injuring them.

**CHERRIES.**—The *Bigarreau* and *Duke* varieties which are growing against south and west walls have been one mass of bloom here, and have set enormous crops of fruit. These trees sometimes cast a large quantity of their fruits before the stoning process commences, which is generally attributed to the strain endured by the trees in perfecting such a large quantity of bloom or to insufficient moisture in the borders. Carefully examine all borders, therefore, and if water is required, afford them a good soaking, which will undoubtedly assist the trees in holding and maturing their fruits. Cherries require but little dis-budding; merely the removal of those shoots that spring from the under-side of the branches, and thinning those growing in clusters, which, if allowed to remain, cause overcrowding. Train-in sufficient growths to furnish blank spaces, and to replace any worn-out branches. Let all other shoots be stopped at the third leaf, or if the two small leaves at the base are counted, then at the fifth leaf. Cherries are very subject to attacks from the black-fly, *Aphis cerasi*, and on its first appearance means should be taken for its destruction by well spraying the trees in the evening with some reliable insecticide. One pound of strong tobacco soaked in 3 gals. of boiling-water is a sure remedy. Spray the trees with this solution when it has sufficiently cooled, and well syringe them a few hours later with clear soft water.

### THE KITCHEN GARDEN.

By C. HERRIN, *Gardener, Drogheda, Maidenhead.*

**RUNNER BEANS.**—A deep soil that has been previously trenched and well enriched with rotten stable-manure should be selected for this crop. The first portion of seed should be sown now, and another sowing made in six weeks' time, or two more made at intervals of one month from the first sowing. Runner Beans are generally sown in double drills about 3 inches apart, and these 3 feet asunder. A rather more economical method is practised here. When the ground has been trodden over to break down any lumpy pieces, and the surface made moderately fine, a line is laid down across the middle of the piece, and centres of 4 feet in diameter marked out along the line by inserting a stick at every 6 feet after the first, which should be 3 feet from the end. This allows circles to be drawn out with a diameter of 4 feet from each centre, and gives a clear space of 2 feet between each. Into these circles the seed Beans are dibbled 6 inches apart and about 2 inches deep, a few being also put in the middle of one of the circles as a reserve for replacing any failures that may occur. Rods 10 feet or more in length are used for supports, but before these are placed to the Beans, and when these are about 6 inches high, a wheel-barrowful of rotted manure is spread over the ground in each circle. When the rods have been inserted firmly in the ground, they are drawn slightly together about half-way up with a band of tarred string, the string being wound once around each rod to hold them firmly in position. In this way a greater number of pods are produced, and better exposed to light and air, than is possible on two double rows of Beans; and they occupy less space. Should the weather prove hot and dry, a good mulch should be given outside the circles, upon which water may afterwards be poured copiously. If stakes cannot be had, these Beans may be sown in single lines 3 feet apart, and have the points removed when about 1 foot in height. If they are afterwards pinched occasionally, good crops may be grown in this way, but the pods will be less in size and not of so good quality as those grown upon stakes.

**FRENCH BEANS.**—A good batch of *No Plus Ultra* dwarf French Beans may now be sown in the open. The climbing French Bean is a useful acquisition; it produces pods of the type of the dwarf Bean, but requires sticks about 6 feet in height. The rows should be 4 feet or more apart.

**BROAD BEANS.**—If a supply of these be desired throughout the summer, another sowing should now be made. The improved form of the *Green Windsor* is one of the best for summer use; although not so prolific as the *Long-pods*, it withstands heat and

drought fairly well, and the beans are good in colour and flavour.

**TOMATOS.**—Those intended for planting outside should now be ready for putting into 5-inch pots. When this has been done, return them to a light position in an intermediate-house until established, and from thence transfer them to frames or pits to harden off, planting them out at the end of the month or early in June, according to the locality and the state of the weather.

**BEETROOT.**—The seeds for producing the main crop of Beet may now be sown without much danger of coarseness arising from over-luxuriant growth. The land need not be rich, but it should be well worked, and if not already prepared, a piece from which a crop of green-stuff has been cleared may be utilised. Dig the ground, and then afford a good surface-dressing of salt and soot before treading and raking takes place, but put in no manure. Make the surface firm, and sow the seeds thinly in drills about an inch in depth, and 12 inches apart. The varieties of garden Beet are numerous: Dell's Crimson is one of the oldest, and is a good variety, of medium-size; Sutton's Blood-Red, Pragnell's Exhibition, Carter's Perfection, and Cheltenham Green-Top are all good main-crop Beets.

**MUSHROOMS.**—Beds in bearing should be covered with dry litter, which after rain should be shaken out to dry, the beds being left uncovered for a few hours. The last bed or beds out-of-doors should now be made up, and the position should be where there is shade from the sun by trees, or on the north side of a wall or building. If the manure has been properly prepared, the beds may be made up, trodden firmly, then spawned, and eased over with some fine unctuous loam 2 or 3 inches in depth.

### PLANTS UNDER GLASS.

By JNO. MCINTYRE, *Gardener, Woodside, Durlington.*

**COCKSCOMBS AND CELOSIAS.**—It is best to confine these plants to thumb-pots until they show their combs, which, if the seeds were sown in March, should now be seen. Select only those which show the most perfect combs, and shift these into larger pots. For the purpose of keeping the plants dwarf, remove some of the lower leaves, and set them low in the pots. For the potting-compost use dried cow-manure rubbed through a  $\frac{1}{2}$ -inch sieve, leaf-soil, and loam in equal parts. The last two should not be too finely broken up. Plunge the pots to the rim in a gentle hot-bed. Admit air on all favourable occasions to prevent the plants becoming leggy.

**INDIAN AZALEAS** which have ceased to flower, and are showing signs of fresh growth, should now be repotted or top-dressed as each plant may require. Previous to repotting, remove all stakes from the plants, except in the case of specimens, the centre stake of which may remain for the purpose of steadying the plants. Two parts peat, one part each of loam and coarse silver-sand, is a compost well suited to Azaleas. A move to one size larger pots is quite sufficient in the case of small plants, but pots two sizes larger may be given to specimen plants. Firm potting is very essential. Cleanse any of the plants infested with thrips or spider by using one of the many insecticides sold for this purpose. Give the plants a good watering after potting, and place them in a night temperature of 65°, rising to 75° by day, where they should remain until the growth is completed. Syringe the plants well overhead night and morning.

**GLEICHENIAS.**—It is not yet too late to divide these plants, if an increase of stock is desired. Large specimens for show purposes now growing freely require to be syringed several times daily, so as to keep them constantly moist. If the specimens have not been attended to in the matter of staking and regulating their growth, this should be done at once. In doing it, be careful that all decayed points of stakes are removed, as decaying wood is apt to develop fungus. The object ought to be so to distribute the fronds that the stakes may not be seen, and as few stakes as possible should be used.

**ADIANTUM CUNEATUM** is universally grown for use in pots, and for cutting purposes it should be grown in batches for furnishing fronds during the year round. If strong seedlings were potted into thumbs last season, they should now be ready to re-pot, and if grown on through the summer they will be fresh for autumn and winter use. Do not use pots of too large a size, it being much better to give

several small shifts in the season. Keep the plants on shelves near the glass, and give shade only during the hottest part of the day. They require an abundance of moisture, and with this intent the paths and stages should be damped frequently; but do not syringe the Ferns overhead. The best results are obtained from rich loam and good leaf-soil, to which should be added a sprinkling of river or silver-sand.

**THE STOVE.**—The season has so far been most favourable, there having been an unusual amount of sun-bine. Continue to use caution in the matter of ventilation, particularly where the cold air is not forced to pass over the hot-water pipes. Pot-on spring-struck plants until they are in the size of pot best suited for the various purposes for which they are wanted. Seeds of Palms should be sown as soon as they can be procured, which is generally during April and May. Seeds of some of the varieties of Bamboos can also be had; and if they are sown now, and the plants grown on through the season, they will make useful furnishing plants next season. If a stock of Bamboos is already possessed, the plants may be increased by division. These plants are now growing freely, therefore keep them and the beds well damped, and syringe overhead daily. Large specimens may require frequent waterings with liquid from the farm-yard; soot-water also suits them well. Palms require to be densely shaded at this period of their growth, and the foliage will assume a much deeper shade of green if this be done.

### THE FLOWER GARDEN.

By HEMLEY WARREN, *Gardener, Aston Clinton, Tring.*

**GENERAL WORK.**—Grass-berges to beds and walks will now need to be clipped more frequently, once a fortnight at least, or they will present an untidy appearance. Paths that have not been gravelled, or the materials of which they consist turned, may be given this attention if the weather be showery, after which they should be raked smooth and even, and well rolled. All vacant beds in the flower-garden should be prepared for the reception of the summer bedding-plants, and in doing this, avoid making the soil very rich by the addition of rank manure, but use only that which is thoroughly decomposed, such as that furnished by a spent Mushroom-bed. Any plants that will withstand a degree or two of frost may now be removed from the frames, and thus make room for less hardy subjects. Sweet Peas should be staked, and another sowing of Mignonette made in an open border. Stocks, Asters, and Zinnias may still be sown in a gentle heat; such will afford a late bloom. As soon as the seedlings appear remove them to cooler quarters, or, if sown on a hot-bed, remove the lights on all favourable occasions, so that the plants may not become weakly. Prick them off into prepared beds or boxes when large enough.

**SUMMER BEDDING** will now demand a good deal of attention in the way of arrangement. Many hardy plants are now used, even in the summer display, and greatly extend the season of bloom, being unaffected by early frosts.

**CONIFERS**, such as *Cupressus erecta viridis* and *Retinosporas* in variety; *Phormium tenax variegatum*, hardy Palms, Grasses, &c., may all be used with advantage in suitable positions. *Sedums glaucum*, *elegans*, *acre*, and *densum*, *Saxifrages* in variety, *Cerastium tomentosum*, *Herniaria glabra*, *Echeverias*, *Senpervivums*, *Gold* and *Silver-leaved Thymes*, *Yuccas*, &c., may also be used for filling small beds or as edgings. *Dracena australis* is a capital subject in the flower-garden or pleasure-grounds, used as a specimen plant, or in sheltered positions on the lawn in groups. In many places the plant is hardy, but in less favoured localities some protection during the winter months is requisite.

**SUMMER-FLOWERING CHRYSANTHEMUMS** may now be planted out in a sheltered border. Manure the ground well, and deeply dig it before planting. Should the soil be at all dry, afford the plants a good watering after planting.

**SUB-TROPICAL PLANTS.**—Such as *Giant Hemp*, *Solanums*, *Ricinus*, and others, may yet be potted and grown on in frames or pits, it being yet unsafe to plant these outside for a week or two.

**HERBACEOUS BORDERS** are now assuming a gay appearance, and most of the plants are making rapid growth. Afford support to plants that require staking, keep down weeds, and stir the surface of the borders with a hoe.

**BORDER CARNATIONS AND PINKS** will, perhaps, need some protection against birds. Small birds fre-

quently destroy the points and leading growths of these plants, and sometimes serious destruction is wrought by pheasants and rabbits. Well dust the plants with tobacco-powder, or spray them with a strong solution of Quassia-chips, as protection from birds, but rabbits must be kept away altogether.

**ROSES ON WALLS**, or in sheltered positions, are now swelling their buds rapidly, and even expanding their blooms. If the plants are infested with green-fly, syringe them well with a solution of tobacco-water, and a few hours afterwards cleanse the leaves with clear water. All the leading growths should be carefully secured, but not tied so close as to give a stiff appearance.

### FRUITS UNDER GLASS.

By W. POPE, *Gardener, Highgate Castle, Newbury.*

**THE PINERY.**—Careful attention should be given to firing and ventilating at this season, owing to the occurrence of cold nights often followed by bright sunny days. In the day-time the heated hot-water-pipes and the large amount of ventilation afforded, produce very trying conditions for young growing stock. The heat in the pipes under these circumstances requires to be kept well in hand, and as low as possible, and the paths, &c., frequently sprinkled to counteract the consequent aridity. Ventilation may begin early in the day, increasing the amount as may be required, and as gradually reducing it in the afternoon. To allow the heat to run up high before air is put on, and then to air freely all at once, is very injurious to the plants.

**SUCCESSION PLANTS.**—These, if they were re-potted early in the season, will now be growing freely. When closing the pits in the afternoon, a very high temperature should be avoided, or weakly instead of robust growth will be made. By employing as little fire-heat as practicable, and husbanding the heat of the sun, maintaining a moderate amount of moisture by occasional sprinkling of paths, a night temperature of from 65° to 70°, and allowing sufficient moisture at the root to prevent premature fruiting, satisfactory growth will be made. A light syringing occasionally at closing time will be advantageous, but the syringing should not be so heavy as to cause water to lodge at the base of the leaves. Some of the earliest plants of the Queen variety will now be swelling towards maturity, and when required at an early date these may be pushed on with a higher day temperature, affording plenty of aerial moisture, especially in the daytime, and when closing the pit, at which time the heat may reach 90° on bright days. As soon as the fruit begins to colour, the aerial and root-moisture must be lessened, and air in greater quantity given. Should there be fruits which are much earlier than others, remove them to a drier and more airy house, so that the proper conditions for perfecting the later ones may be carried out. Plants, on first showing fruit, should have the soil thoroughly moistened with weak guano-water, and liberal supplies of the same should be afforded as needed whilst the fruit is swelling, but when it begins to ripen, clear water, and that in lessened quantity, will suffice. With modern houses and large panes of glass, a slight shade for an hour or so at mid-day is beneficial to the plants in very bright weather, but much shade is injurious.

**LATE VINERIES.**—The Vines may now be pushed on by the aid of sun-heat as fast as possible, and as soon as the fruit is set, no time should be lost in getting it thinned. Such varieties as Alicante are difficult to thin, if thinning be not done early. Care must be taken to fertilise shy-setting varieties, of which Alnwick Seedling and Mrs. Pince are examples. This is best done with pollen from free-setting varieties. If red-spider is apt to infest the Vines, it is better to syringe the foliage occasionally, rather than allow it to gain a footing, but only clear, soft-water should be used. Over-dryness and starvation at the roots are fruitful causes of red-spider on Vines, especially on light soils and in dry localities; therefore, liberal root-waterings should be frequently afforded, as well as mulchings of half decayed manure, as a preventative of excessive evaporation of moisture, which will also tend to keep the roots near the surface.

"THE BOSTON FLOWER MARKET AND NEW ENGLAND FLORIST."—This is the title of a new horticultural journal, whose object may be gleaned from its title. It is specially intended to cater to the interests of the commercial florists in New England.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any writers which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE MONTH.

SATURDAY,	MAY 2	Dresden Internat. Hort. Ex. (six days). I. of Wight Hort. Assoc. Soc. Franc. d'Hort. Meet.
SUNDAY,	MAY 3	Royal Hort. and Agr. of Ghent Sh.
TUESDAY,	MAY 5	Royal Hort. Soc. Com. at Drill Hall.
THURSDAY,	MAY 7	Linnean Soc. Meet.
FRIDAY,	MAY 8	Roy. Bot. Soc. Lecture.
SATURDAY,	MAY 9	Roy. Bot. Soc. Meet.
SUNDAY,	MAY 10	Brussels Orchidœenne Meet.
WEDNESDAY,	MAY 13	Roy. Bot. Soc. Summer Show, at Regent's Park.
FRIDAY,	MAY 15	Roy. Bot. Soc. Lecture.
TUESDAY,	MAY 19	Temple Show of the Roy. Hort. Soc. (three days). Devon Agr. Soc. Sh. at Plymouth (three days).
THURSDAY,	MAY 21	Whitsuntide Exh'ib. at the Manchester Bot. Gardens.
FRIDAY,	MAY 22	Roy. Bot. Soc. Lecture.
MONDAY,	MAY 25	Linnean Soc. (Anniversary).
WEDNESDAY,	MAY 27	Bath and West of England Agr. Sh. at St. Albans (five days).
FRIDAY,	MAY 29	Roy. Bot. Soc. Lecture.
SATURDAY,	MAY 30	Roy. Bot. Soc. Meet.

SALES FOR THE ENSUING WEEK.

WEDNESDAY,	MAY 6	Japanese Lilies, Carnations, Begonias, Cannas, &c., at Protheroe & Morris' Rooms.
FRIDAY,	MAY 8	Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—52°2'.

Flowers of Conifers. At this season of the year we receive numerous specimens for identification, mostly miserable scraps, badly packed, and badly labelled; but we have our compensation in the receipt of others to which no such uncomplimentary remarks can apply, and many of which are of great beauty. Among them we have to note this week several specimens of Conifers. These are very acceptable, either from their beauty or for the interest attaching to them. It is curious that while observers note the full-grown trees and the ripe cones, they often pass over the flowers, notwithstanding their frequently brilliant coloration. Sometimes they grow at the

tops of the trees, and are thus not easily procured. Hence it happens that of several commonly-grown species, the flowers are not known at all, or only imperfectly so, and many of them are not figured even in botanical books. In this category we may place the Wellingtonia (Sequoia gigantea), of which we give an illustration (fig. 85). In this case the young female cones are so inconspicuous that we have had some

FIG. 85.—FEMALE FLOWERS OF SEQUOIA GIGANTEA (WELLINGTONIA).

difficulty in securing specimens, but thanks to Mr. HERRIN, of Dropmore, Mr. FORBES, of Bowood, and Mr. HARDING, of Orton, we have been enabled to secure a good supply of the flowers, both of this species and of the Redwood, Sequoia sempervirens, of which we give an illustration (fig. 86) for purposes of comparison. The structure is most simple, consisting merely of a bract with which the true seed-scale is inseparably fused. In most of the Pines and Firs the bract is small and inconspicuous, and the

FIG. 86.—FEMALE FLOWERS OF SEQUOIA SEMPERVIRENS (RED WOOD).

great mass of the ripe cone is made up of the thickened seed-scales. In the Sequoias it is the developed bract that is the most conspicuous portion. In the Wellingtonia these bracts taper gradually into a very long point or acumen. In the Redwood, the bracts are rounded at the end, and the point or acumen is much shorter, and starts more abruptly from the tip of the bracts.

These flowers are chiefly of botanical interest, but those we have now to mention are exceedingly brilliant in their coloration. Thus, Mr.

DENNY, Down House Gardens, Blandford, sends female cones of Picea ajanensis (sent as Abies Alcockiana). Those are placed at the ends of the branches, and are of a lovely carmine colour of unrivalled brilliancy.

Mr. GEORGE PAUL sends female cones of Abies brachyphylla, which promises to be a first-rate tree either for ornamental or for economic purposes. In this case the female cones are cylindric-conic, and of a dull purple colour. They stand erect from the surface of the lateral branches like so many tapers. Mr. PAUL's specimens showed a peculiarity which we have not observed before. When received, the cones were as erect as grenadiers. They were taken out of the box in which they had been sent, and laid uncovered on a table throughout the night. The next morning the young cones, by the bending over of the short stalk that supports them, were bent over into a horizontal position almost parallel with the branch. This is an additional example of the remarkable movements observable in the shoots and leaves which have been noticed from time to time. The movements of the leaves of some of the Pines, e.g., P. halepensis, according to various conditions of the weather may be noticed in the Riviera, and to a less extent in this country. Now, Mr. CROUCHER, of Ochtertyre, tells us of a Japanese Pine, the species of which is uncertain, which, on a wet day and after rain, has a "drenched, drooping appearance," but whenever the sun appears and the air becomes dry, it changes rapidly, and assumes a totally different aspect. These movements are obviously intended as a provision against injury from an excessive amount of water.

From Orton also come sprays of Abies amabilis, with a profusion of male catkins springing from the under-surface of the branch; they are of a rich orange-crimson colour. Mr. HARDING remarks that they occurred mostly towards the top of the tree, which looked as if covered with bright Holly berries, and presented a grand spectacle. Some years since we figured a male spray of this species, and described the catkins as solitary!—but that description is very far from being applicable to the profusion of splendid catkins now before us. This is another illustration of the fact that the flowers which are first produced, and which we are so eager to see and to figure, are often much less satisfactory than those which appear afterwards.

A CORRESPONDENT asks for information about the culture of China Asters, and, as others may be interested in the subject, we subjoin the following hints, which may be of service: Above all things, the best possible seed of the various types, of which there are about twenty-four, should be obtained. The seed should have been sown on a mild hot-bed in the month of April, thickly broadcast, for the reason that scarcely 50 per cent. of the seeds from the very double varieties will germinate, owing to their imperfect development, itself partly the result of too much moisture in the autumn. The soil on which Asters are sown should be well-prepared; it should consist of light loam and leaf-mould, and should contain a small quantity, say one-sixth, of charred soil, and enough sharp-sand to allow water readily to pass through it. The bed of soil should not be less than 4 inches thick, and may be as much as 6 inches; it should be pressed with a piece of board to make it moderately firm and level, but not trodden.

VIEW IN THE ROCKERY IN THE GARDEN OF C. T. LUCAS, ESQ., WARNHAM COURT, SUSSEX.

After the seed is sown, press it into the soil with the board, water it with a fine-rose can, and then sift over it through a very fine sieve one-eighth of an inch of the same soil as the seed-bed is made of. Nothing more will be necessary beyond keeping the lights shut till the seeds begin to germinate, when air must be afforded, gradually at first, and then in larger quantity. Unless the sowing is made in March or early in April, no pricking out will be necessary, but the seedlings may be transferred direct to the open ground; and as the Aster is capable of withstanding several degrees of frost, the transplanting may take place early in the present month. The chief aim of the gardener should be to obtain a robust, stocky growth, and that is only to be obtained by careful ventilation at first, and full exposure of the plants to the air whenever the weather is not unfavourable. Weak, slender plants want sticking to keep them upright, and are, even then, easily broken by wind and the weight of their blooms.

The patches of the varieties in the seed-bed must be kept separate by pressing laths edge-wise into the soil, every patch having its proper label. The Dwarf Bouquet pyramidal, Chrysanthemum-flowered, pyramidal, Victoria, Crown, Peony-flowered, and Quilled, are an excellent class, of low stature. The first-named is early and floriferous, the second large-flowered and late, as is also the Victoria. Of taller growth than the foregoing are the Peony-flowered Globe, which has large flowers, abundantly produced; the Victoria, a capital variety; and the imbricated Chrysanthemum-flowered, a good showy, long-flowering variety. We believe that seed-saving has been successfully carried out in recent years in this country, notably at Eynsford, in Kent. The greatest dangers to successful Aster culture are very hot days following nights with a very heavy deposit of dew which causes rust; and abnormally wet, cold autumns, which cut off the plants, or hinder the ripening of the seeds, and the more double the blooms the more likely is this mischief to occur.

**LINNEAN SOCIETY** (April 16).—Mr. W. PERCY SLADEN, Vice-President, in the Chair. Messrs. V. H. BLACKMAN and W. B. HEMSLEY were elected, and Messrs. J. W. CORNWALL, W. M. CHRISTY, P. EWING, and J. H. LEIGH were admitted Fellows of the Society. Mr. GEORGE MASSEE read a paper on the "Types of Fungi in the collection of the late Rev. M. J. BERKELEY," which was presented to Kew in 1879, and which contains rather more than 11,000 species. Many of the species were described more than fifty years ago; hence the diagnoses are in some cases too brief, and do not embody points which at the present day are considered to be of importance. In many instances this has led to the same species being re-described by others as new. Mr. MASSEE now supplied careful descriptions of the types, with a view to obviate future confusion, and to secure for BERKELEY, as the original describer, the priority in nomenclature which is justly his. Mr. A. D. MICHAEL read a paper upon the "Internal Anatomy of *Edella* (the Red-nouted Mite)," giving the results of three years' work, and of many hundreds of dissections and serial sections. The material was furnished chiefly from the Zoological Station at Port Erin, and the subject is practically new, only one paper (describing a few parts of the female) having been hitherto published.

At a meeting to be held on Thursday, May 7, at 5 P.M., a paper will be read on "The Tooth-Genesis of the Canidae," by Dr. H. MARETT-TIMS. Exhibitions will be given:—1. Lantern-slides, illustrative of the Habits of the Tigerbeetle, *Cicindela campestris*, by

Mr. F. ENOCK, F.L.S. 2. Preparations of the Hermaproditic Glands of *Apus*, by H. M. EERNARD, F.L.S.

**ROYAL HORTICULTURAL SOCIETY.**—The next meeting of the Fruit and Floral Committees of the Royal Horticultural Society, will take place on Tuesday, May 5, in the Drill Hall, James Street, Victoria Street, Westminster, 1 to 5 P.M. At 3 o'clock, a lecture will be given by Mr. J. G. BAKER, F.R.S., on "The Species and Varieties of cultivated Tulips." An interesting feature of this exhibition will be a large collection of original paintings of Tulips and Daffodils by Mr. W. J. CAPARN, of Oundle, Northamptonshire.

**NATIONAL ROSE SOCIETY.**—A meeting of the General Purposes Committee will be held at the Rooms of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Tuesday, May 5, at 2 P.M., for the purpose of revising a list of Hybrid Teas for the Society's Report, to draw up a list of the judges for the Crystal Palace Show, and other business. At 3 P.M., the matter of the space available at the Crystal Palace for the Society's show will receive attention. Other matters are the publication of the official catalogue in the new edition of *A Book about Roses*, &c.—H. HONEYWOOD D'OMBRAIN and EDWARD MAWLEY, Hon. Secretaries.

**ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.**—The acting directors of this Society met at the office of the Secretary (Mr. A. M. BYRES, C.A.), on Monday evening, 27th ult., Mr. JAMES MURRAY, Glenburnie Park, presiding. The meeting had under consideration the arrangements for the annual show, which is this year to be held in the grounds of Gordon's College. Committees were appointed to take charge of the various sections, judges nominated, and various other matters discussed.

**FLOWERS IN SEASON.**—Mr. DENNY, from Down House Gardens, Blandford, sends us a charming set of small Calochorti, grown under a south wall without protection—yellow lilac-white forms are sent. In severe winters a mulching of short litter is afforded them, but this year no such protection was needed. Messrs. BALCHIN & SONS send flowers of the superb *Posoqueria longiflora* (if that be the right name?), to which we shall refer on another occasion. From the same source come flowers of a seedling form of *Azalea sinensis* of gardens, with cream-coloured, very fragrant flowers, harmonising beautifully with the delicate green foliage. The original *A. sinensis* had yellow flowers, like those of *A. pontica*. What are now sent are more like some form of *A. mollis*.

**RÖNTGEN'S RAYS AND PHOSPHORESCENT FUNGI.**—The comparatively feeble light given by RÖNTGEN'S rays seems comparable, says our valued artist-correspondent, Mr. W. G. SMITH, with the feeble but very penetrating light given out by phosphorescent fungi. Since the discovery of the action of the X rays, I have not seen any phosphorescent mycelia, but I well remember the light penetrating several thicknesses of packing paper. In the *Gardeners' Chronicle* for Dec. 4, 1875, p. 719, I have recorded the light as having been distinctly seen through two thicknesses of writing paper. In the *Gardeners' Chronicle* for September 21, 1872, p. 1257, the Rev. M. J. BERKELEY has recorded an instance of the phosphorescent light from fungi penetrating through five thicknesses of paper, the light penetrating through all the folds on either side of the example, as "if the specimen was exposed."

**THE CHRYSANTHEMUM.**—The principal chemical constituents of the Chrysanthemum are said by M. GEORGES TRUFFAUT to be in the order of their importance: 1, lime; 2, phosphoric acid; 3, potash; 4, soda; 5, magnesia; 6, nitrogen; 7, silica; 8, sulphuric acid; 9, oxides of iron and manganese; 10, chlorine. In the flowers, nitrogen exists abundantly, as well as phosphoric acid, magnesia, and potash; lime exists in the leaves, and large quantities of silica in the roots. The compost recommended by M. TRUFFAUT in the *Journal of the Société Nationale d'Horticulture de France* as the

outcome of his investigations: Leaf-mould, 1 part; mould from an old Cucumber-bed, 1 part; coarse sand, 1 part; loam, 1 part; wood-ashes,  $\frac{1}{4}$  part. Over this is dusted a small proportion (1 per cent.) of phosphate of lime.

**LETTERS OF HANS SLOANE TO MR. JOHN RAY.**—HEATING PLANT-HOUSES: We are indebted to Mr. BRITTON for the following extracts from letters written by Sir HANS SLOANE to his friend JOHN RAY. The letters are in the possession of — ENYS, Esq., of Enys, Penryn, by whose permission a copy was made for publication. The last paragraph of SLOANE'S letter beginning with the words "of which" is said not to have been published previously:—

London, November 18, 1684.

Sir,—I received yours and had returned you sooner but that I hoped to meet Mr. WATTS, and to have spoken to him about what you desired; but hitherto have not had that good fortune, altho' I went once on purpose to Chelsey. But I believe I can procure what you desire either of him or some others of my acquaintances or in Fulham, and will then send them by Mr. FAIRBOURNE to you.

I am heartily pleased to hear that you are about soe useful a work as the history of Plants (done by you) will be. I am sure we want it extremely, and that it will be very much esteemed by the botanists beyond the sea, particularly Mons. TOURNEFORT, the King's Professor at Paris (with whom I correspond) who told me he desired it extremely, and that he had a very great respect and honour for you, and desired me to give you his most humble services, and if you will be pleased but to let me know anything you may have occasion for that can be procured at Paris or Montpellier, I will do all in my power to help you to it. I have several plants that I brought from this place, amongst which are several nondescripts, all which shall be at your service, with what remarks I made about them, either as to their growth or virtues. The following plants are thought rar at Chelsey and Fulham:—[Here follows a list of plants, &c.]

I believe you may have seen the most of these, they being survivors of the last winter, and probably the most of them will keep out this, Mr. WATTS having a new contrivance (at least in this country) v. z., he makes under the floor of his greenhouse a great fire place, with grate, ash-hole, and conveys the warmth through the whole house by the help of a tunnel, so that he hopes by the help of weather-glasses within to bring or keep the air at what degree of warmth he pleases, letting in upon occasion the outward air by the win-dows. He thinks to make by this means an artificial spring, summer, winter, &c. . . .

Of which I something doubt, but in that matter experience must be the only judge. There are scarce any books of concern to botany published this while past; only one, and called *Hortus Medicus*, Edinburg, in which is very little but what may be met with elsewhere. The author is one Mr. SUNDELLAN. There is another printed at Edinburg in fol., its title is *Prodromus Naturalis Historiæ Scotiæ*. In it is described the *Apium maritimum*, and one or two more Scotch plants. We expect here daily the *Catalogue of [the] Leiden Garden*, done by HERMANS, who is at present Botanical Professor, where are account of several East India plants, the author having lived at Batavia in the East Indies for several years. I wish you all success in your undertaking, and desire you may command me without ceremony in anything you think I can forward or give you; and be pleased to direct to me at Mr. WILKINSON'S, Bookseller, at The Blackboy, over at St. Dunstan's Hill Church, in Fleet Street, and it will find your most humble and most obt. servt. HANS SLOANE.

Mr. JOHN RAY, at Black Notly, near Brentry, Essex.

[EVELYN in his *Diary* mentions a visit to the "Apothecaries Garden of Simples" at Chelsey, where he saw the method of heating above referred to:—

"What was very ingenious was the subterraneous heat conveyed by a stove under the conservatory, all vaulted with brick, so as to have the doores and windowes open in the hardest frosts, including only the snow." *Evelyn, Diary*, August, 1685.]

**PRICES OF FOOD IN MASHONLAND.**—Dr. GALL, Bishop of that ilk, who is endeavouring to raise in this country the wherewithal to enable him and his family to "live, move, and have their being" with less of the disagreeables of life in an uncivilised community than now obtains, writes that "out there," quarter-leaves of bread cost 2s. 6d.; Potatoes are £6 and £7 per bag—once they were £12; butter varies from 5s. to 10s. per lb.; meal for porridge ranges from £2 to £3 per bag; eggs, the "living of vigils and fasts," cost from 5s. to 10s. per dozen. It may not be uninteresting to note here (per Agent-General) that notwithstanding political complications of recent days, there has been no alteration in prices in Natal for either field or garden produce.

## MEETING OF THE BRUSSELS ORCHIDÉENNE.

The last meeting was held soon after the customary annual banquet of the society, and was a very successful one. Among the finest exhibits were M. LINDEN'S *Odontoglossums*, including:—*O. crispum* var. *meleagris*, all the divisions of the flower clear purple, with many spots and dots of clear brownish-red; *O. crispum* calos, with large dark violet-carmine pots; *O. × spectabile*, of the excellens type, flower spreading, of a beautiful yellow colour, bandsomely marked; *O. × concinnum*, of the Wilkeanum type, finely variegated with brown spots on a pale yellow ground. M. LINDEN also shewed a very interesting *Oncidium* multicolor, the lip sulphur-yellow, the divisions of the flower chocolate-brown, the gynoesteme and crest of the lip purplish-claret; *Enlophia congoensis*, suggesting in the habit of the plant and structure of the flower *Calanthe Veitchi*—the flower is a pretty clear rose-colour; *Cattleya Mendeli*, very fine; *Odontoglossum × miniatum*, with very large and dark spots; *Cattleya Mendeli eximia*, very pretty; *Cypripedium Argus* var. *Lindeni*, splendid in size and colouring; and *C. exul*. With seven charming blooms, M.M. LUCIEN LINDEN ET CIE. sent, from Moortebeke, *Odontoglossum Pescatorei* var. *guttatum*, with large spots on the three sepals, and small ones on the other divisions; also *Mesospidium vulcanicum grandiflorum*, which certainly deserves its last name; a group of *Odontoglossum cirrosium maximum*, with enormous trusses of pretty flowers; and some fine *Cattleya Trianaei*. M. J. MOENS continued his display of *Cypripediums*, sending such as *C. Stella excelsior*, *barbatum illustre*, *Imshoottianum superbum*, *Anna*, &c. M. JOHN SCHULZ showed *Cattleya Trianaei* var. *Schulziana*; M. CAHUZAC, *C. Skinneri* var. *oculata*, a good colour; M.M. DALLEMAGNE ET CIE., *C. Mendeli*, of fine habit and delicate colouring; M. le Chevalier DE WARGNY, *Cypripedium Wallisi*, as rare as curious; Mr. THOMPSON, from Stone, exhibited *Cattleya Lawrenceana*, brilliant in colour, and *Odontoglossum crispum* var. *Argus*, which was awarded a Certificate of Merit *à l'unanimité*; also *O. triumphans*, well coloured; and *Cattleya Skinneri*, Thompson's var. M. FLORENT PAUWELS sent a fine *Lycaste plana* well bloomed; *Cattleya speciosissima*, *Odontoglossum Reichenheimi*, a very beautiful variety; *O. Rossi majus*, *Bifrenaria Harrisoni*, *Cypripedium ciliolare*, &c. M. WAROCQUÉ sent a pretty *Eulophiella Elisabetha*, *Odontoglossum cirrosium maximum*, with very large flowers; and a specimen plant of *Oncidium ampliatum majus*, with thirty floral stems bearing splendid trusses of bloom. M. VAN WAMBEKE showed a remarkable variety of *Cypripedium Rothschildianum*, a good *Odontoglossum hystrix*, well bloomed; and *O. Wambekeanum*, an excellent variety, with two splendid flower racemes. Mr. H. KNIGHT exhibited a fine *Cattleya Lawrenceana*; M. DE LOMBAERDE, *Odontoglossum Ruckeri*, nicely spotted; and Mr. STEPMAN, *Cattleya Mendeli*. I would also mention *Odontoglossum polyxanthum* and *Pescatorei* from M. COPART, two specimens flowering abundantly; also *Cattleya Mendeli × Mossiae*, the lip of which is especially ample, and the colouring excellent. M. LIBRECK, of Paris, sent two elegant plants—*Polygonis muscifera* and *Nanodes Mantini*. *Ch. de B.*

## ULSTER HORTICULTURAL CHRYSANTHEMUM SOCIETY.

It has been decided, writes a correspondent, to throw open to the three kingdoms the Nurseryman's Class for cut blooms of Chrysanthemums, and it is to be hoped that similar competitions will be extended to gardeners on a future occasion.

## "DICTIONNAIRE PRATIQUE D'HORTICULTURE."

The forty-seventh *livraison* of this work, often mentioned in these columns, is now published, bringing the work down to the letters Pass.

**BULLETIN DE L'ASSOCIATION POUR LA PROTECTION DES PLANTES.**—This Society, founded at Geneva in 1883, is still flourishing, and the present *Bulletin* includes a very favourable report, brought up to March, 1896. Other contents are:—"Notes on

the Exposition Nationale Suisse, at Geneva;" "Au Pied du Cervin;" "*Betula nana*;" and various paragraphs and letters on subjects relating to the interests which the Society has undertaken to protect. The *Bulletin* is issued by W. KÜNDIG ET FILS, Vieux-College, 3, Geneva.

## TORQUAY DISTRICT GARDENERS' ASSOCIATION.

We have before us the report and balance-sheet of this body for the year 1895-96, of which the President is Dr. R. HAMILTON RAMSAY, and the Hon. Treasurer and Secretary, Mr. FRED. C. SMALE, Isaline, Avenue Road, Torquay. The report shows a state of continued prosperity, and proof of this has been apparent in the increased attendances at the ordinary meetings during the past session, and by the satisfactory state of the society's finances. The balance-sheet shows a surplus of £6 4s. 9d., as compared with a balance of £4 15s. 11d. at the last annual meeting. The amount of subscriptions, as compared with those of last year, is very satisfactory, and is larger than in any previous year. The new venture of the association, in holding a Chrysanthemum show in October last year, turned out a success financially and otherwise.

## ABERDEEN CHRYSANTHEMUM SHOW.

—Arrangements are now complete for the holding of a Chrysanthemum show in Aberdeen on November 20 and 21 next, the committee in charge having settled one of the last details the other day, when they had the good fortune to secure the Aberdeen Art Gallery in which to hold the exhibition. More than a decade has elapsed since an exhibition of this kind was held in Aberdeen. The show is to be called the Aberdeen Chrysanthemum, Fruit, and Vegetable Show. The schedule will contain pot-plants, cut flowers, fruit, and vegetables—sixty-six classes. As regards the prize-money, it has been deemed advisable to let the apportionment of this rest upon the success or failure of the show. It has only to be added that Mr. A. GRIGOR, gardener, Fairfield, is chairman of committee, and Mr. WILLIAM REID, 8, Hadden Street, Aberdeen, secretary. The last day on which entries can be made is Monday, November 16.

## WOBURN EXPERIMENTAL FRUIT FARM.

—We are requested by Mr. SPENCER PICKERING to state that, although no formal invitation to visit the Woburn Experimental Fruit Farm will be sent to horticulturists this year, all who are interested in the undertaking will be welcomed there on any Saturday during the month of May. Those who purpose paying the farm a visit are requested to send notice of their intention two days previously to Mr. L. CASTLE, Ridgmont, Aspley Gnuise.

## G. D. EHRET.

—In the recently-issued part of the *Proceedings of the Linnean Society of London*, is a very interesting autobiographical note concerning this most talented draughtsman, who began life as a gardener. The translation has been effected by Miss E. S. BARTON.

## GEORGE PRINCE MEMORIAL PRIZE FUND.

—The following additional subscriptions have been promised or paid:—EDGAR HANBURY, Esq., £1 1s.; ALEX. DICKSONS & SON, £1 1s.; R. G. N. BAKER, Esq., £1 1s.; O. G. ORPEN, Esq., £1 1s.; Messrs. H. & A. TURNER, £1 1s.; A. HILL GRAY, Esq., £2 2s.

**CORK IN SPAIN.**—It is not so many years since that rough or refuse cork, namely, that unsuited for bottle-stoppers or bungs, was considered a waste product. Since the introduction of linoleum, however, cork cuttings have found a market as an ingredient in the manufacture of these modern floor coverings, as well as in the manufacture of a paving material when mixed with cement. These new demands appear to have been the cause of a new trade in the Cork-growing districts of Spain. The British Consul at Barcelona referring to the fact that Cork forms the staple industry of Palamos, says that the cutting of Cork into stoppers after the sheets have been steamed, boiled, and pressed is carried on to a large extent, and that the shavings are collected, pressed into bales, and shipped for the purposes

above mentioned. The machinery used in cutting the Cork is stated to come for the greater part from one large factory in France—the only one worked by steam and owned by a German firm; the engines and driving machines, as also the electric-lighting machinery, were of German manufacture; but some of the Cork-cutting machines were of English make, and in connection with this part of the industry it is considered there is an opening for British trade and enterprise. Regarding the quantity of Cork exported from Spain, it appears to be very difficult to obtain reliable information, but the following facts are given as being probably accurate: In the province of Gerona, it is estimated that 198,000 acres are devoted to the cultivation of Cork-trees, the amount of Cork being reckoned at about 20,000 tons, and the value at about £1,610,000. Cork is the third item of importance in the list of exports from Spain. Raw or unprepared Catalonian Cork is not exported, as it requires to be worked in a special way, and the Catalans themselves appear to be the only workmen who are able to treat it properly. The prepared Cork is largely exported to British markets, notably to London, Dublin and Edinburgh, Calcutta and Bombay, Sydney and Melbourne, Montreal and Quebec.

## ALFALFA AS A HONEY-PLANT.

—The cultivation of Alfalfa (*Lucerne*) has added considerably to the honey crop of the United States. No other honey-plant has given such a "boom" to bee-keeping, especially in the Western States. This plant stands the drought, and when well rooted seldom fails to produce heavy crops of hay and seeds when almost everything else fails, as its roots penetrate very deep in the ground, in many cases reaching water at 15 feet deep. I have seen a continuous flow of honey from this plant, commencing the middle of May, and lasting until September 1, for several years, without any regard to drought or season. Alfalfa honey differs but little from that from white Clover. It is in every respect as good, and is quoted in the markets at the highest price. *A. H. Duff*, in *Vegetarian*, April 18.

## GLOWING TULIPS.

—Mr. HARTLAND sends us from Cork specimens of Tulips to show their brilliancy. *T. Gesneriana* var. *ixioides* is a form with bright golden-yellow flowers, the base of each perianth segment marked with a dark-green velvety spot. *T. Gesneriana aurantiaca* has fine reddish-crimson flowers faintly flushed with yellow, the segments marked with a central narrow yellow feather, and marked at the base with a brownish-dotted blotch edged with yellow. *T. aurantiaca maculata* is similar to the preceding, but the flowers have more yellow in them, and the basal blotch is greenish-brown.

## BAD TASTÉ.

—In the Paris florists' shops, and lately in our own, *Araucarias* in pots, pans of Hyacinths and Tulips, and what not, are "decorated" with huge bows of coloured ribbon. Though the bows are tied by the deft hands of French women, who enjoy a monopoly in this respect, and though the colours are fairly well assorted, yet the general appearance to the lover of flowers is so repulsive that we trust this fashion will be evanescent. We regret, however, to find that the practice is gaining ground in America.

## "FLORA OF BRITISH INDIA."

—We received last week, just too late for insertion in our comments on the books of the week, the twenty-first part of the above-named book. It is wholly devoted to the grasses, and is a striking example of the industry, patience, and judgment of the author. Sir JOSEPH HOOKER may be congratulated on the near approaching conclusion of his laborious task.

## PUBLICATIONS RECEIVED.

—*The Forester*, an Illustrated Journal devoted to Forestry (C. S. MAGRATH, Printer and Publisher, 121, Federal Street, Camden, N.J.), Vol. II., No. 2, March 1.—*The National Nurseryman* (Rochester, N.Y.), Vol. IV., No. 3, April.—*The Displacement of Species in New Zealand*, by F. KIRK, F.L.S.—*Boletim da Sociedade Brotteriana* (Coimbra), XII., 1895.—*Nuovo Giornale*

*Botanico Italiano*, Vol. III., No. 2, April 5.—*Bulletino della Societa Botanica Italiana*, Nos. 2, 3 and 4, for February, March, and April.—*Some New Orchids from Sikkim*, by G. KING and R. PANTLING (Calcutta).—*Delayed Germination of Cocklebur and other Paired Seeds*, by J. C. ARTHUR (Springfield).—*Peach-growing for Market*, by ERWIN F. SMITH, U.S. Department of Agriculture; *Farmers' Bulletin*, No. 33 (Washington).—*The Grass and Grain Joint-worm Flies* (U.S. Department of Agriculture, Division of Entomology).—*Agricultural Gazette of New South Wales* February, 1896.

PLANT PORTRAITS.

- ANORÆCUM SESQUIPEDALE, *Orchid Album*, t. 518.
- BIGARRÉAU HEDELÉFENOËN GIANT.—Fruit large, oval obtuse, good flavour, mid-season. *Bulletin d'Arboriculture*, April.
- CATTLEYA BLESENSIS X (PUMILA X LODDIGESII). *Orchid Album*, t. 519.
- CHIRITA HAMOSA.—A Gesneriad, with oblong lanceolate leaves, and lilac funnel-shaped flowers in racemes, which are concrescent with the petiole. *Revue Horticole*, April 15.
- CUPHEA PURPUREA, LANCEOLATA, ROSEA, MINIATA, *Revue de l'Horticulture Belge*, April.
- CYPRIPEDIUM LAWRENCKO-REGNIERI.—Leaves mottled, flowers white, heavily flushed with pink, and with numerous, fine deep purple spots, lip shining rosy-purple. *Lindena*, t. 504.
- GAZANIA PYGMÆA, leaves with a central silver stripe, silvery beneath, flower-heads white, flushed with pink. *Illustration Horticole*, March 15.
- LELIA ACTUMNALS, Lindl., var. ALBA. *Lindena*, t. 501.
- LEPTOSYNE MARITIMA.—Yellow Composite, with deeply lacinated foliage. *Garden*, April 11.
- MAMMILLARIA SIMPLEX, *Revue Horticole*, April 1.
- ORNITHOGALUM ARABICUM.—Flowers paniced, white ovary, deep shining black. *Garden*, April 25.
- PÆREZIA SONCHIFOLIA, Baker.—Foliage elegantly cut; flower-heads ½-inch across, in loose panicles. *Revue Horticole*, March 16.
- RICHARDIA LITWYCHEI, N. E. Brown, in *Gard. Chron.*, 1893, August 19.—Spathes yellow, with a deep purple spot. *Revue Horticole*, February 1.
- SPATHOGLOTTIS AUREA, *Orchid Album*, t. 520.
- TEOMA SMITHII X.—Hybrid between *T. capensis* and *T. velutina*. *Illustration Horticole*, April 15.
- THUOPSIS STANDISHII, *Revue Horticole*, April 1.
- TROPEOLIUM PENTAPHYLLUM, *Revue de l'Horticulture Belge*, April.
- VANDA CERULEA, LORD ROTHSCHILD'S VAR.—Very deep blue. *Orchid Album*, t. 517.

NOTICES OF BOOKS.

**BOTANISTS' DIRECTORY (BOTANIKER ADRESS-BUCH, ETC.).** J. Dörfler. Wien, III., Barichgasse 36.

This is an index of the names and addresses of botanists throughout the world. It comprises also lists of the principal botanic gardens, societies, institutes, and botanical and horticultural publications of each country. It will be of use not only to students, but in the offices of our large commercial establishments. So far as we have tested it, it is accurate, and full, as may be illustrated by the pages devoted to Japan.

**LES BROMELIACÉES.** Par L. Duval. (Paris: Octave Doin.)

A small treatise devoted to an order of plants which for some reason or other, we know not what, is not popular in this country. On the continent it is widely different, and we find these gorgeous plants in the great garden establishments, in the marketplace, and on the stall, whence they find their way to the modest apartments of the citizens. The plants, as a whole, are interesting, their coloured leaves and flowers often gorgeous. They are not difficult to grow, though they demand watchful attention and cleanliness. The principal species of horticultural interest are mentioned in this little book, which may be commended to those conversant with the language as an excellent little handbook, compiled with knowledge and judgment by an experienced practitioner.

**NINE HUNDRED AND NINETY-NINE QUERIES AND ANSWERS.**

One wonders how it is that the round thousand has not been obtained, and the temptation to complete the number by asking, Why was this book published?

is great. We entirely sympathise with the spirit of the compiler when he tells us that farmers and gardeners "do not give enough thought to the why and wherefore, cause and effect; for, as a rule, they go on year after year without profiting by the personal opportunities afforded them of observation, or by the results of experiments at scientific stations. With rare exceptions the young farmer and gardener does not take up his work from the scientific side, but strictly from the labourer's side; and he begins at the bottom, meeting the same difficulties as did his father, and too often not acquiring information beyond what his father possessed." Messrs. Landreth & Sons, the eminent seed farmers of Philadelphia, have hit upon the plan of printing the questions they have received, and the answers they have supplied. The idea is a good one, but in carrying it out some sort of classification should have been adopted, and before publication the answers, especially those relating to vegetable physiology, should have been revised by some expert. The explanations given even when correct greatly need condensation and more agreeable presentation.

"Where can I get nitrogen?" some one asks; and this is the answer he gets:—"Assimilable nitrogen may be had to the extent of 20 per cent. in sulphate of ammonia, 15 per cent. in nitrate of soda, 14 per cent. in nitrate of potash; or it can be had in dried blood or flesh from slaughter-houses or fish-factories." How about farmyard manure?

"What are cryptogamic germs?" asks another correspondent, and is told in reply (p. 105):—"The reproductive organs of flowerless plants. Some such plants become trees, but those injurious to cultivated garden vegetables are always microscopic in size, and are known as garden fungi. They have neither leaves nor stems; their reproductive organs are situated in a mass of cellular substance."

It is interesting in this land of Free-trade to see that in the States, where Protection is favoured, thousands of farms (p. 191) are abandoned, and land only one-third of its former value, and agriculture in as bad a state as it is here. The book is likely to be useful as a reminder to proficients, but it is not one we should recommend to novices who have to take statements on trust.

**LE JARDIN DE L'HERBORISTE.** Par M. H. Correvon. (Paris: Octave Doin.)

This is a little book devoted to the requirements of those who wish to cultivate in their gardens herbs and "simples," and to protect themselves from hostile microbes or unsanitary conditions by means of resinous or aromatic plants. The plants treated of are arranged alphabetically, beginning with *Abies* and ending with *Viscum* (*Mistletoe*). It is evident even with herbs that some precautions are necessary. We observe in the book before us, p. 35, that *Aconite* contains an active principle, aconitin, which, given in a large dose, is a violent poison. It does not require a large dose to produce fatal effects, for, on the contrary, an excessively minute dose may be productive of the most dreadful results. It is dangerous to dabble in medicine, and to treat symptoms without knowing the causes that produce them.

**THE ROCKERY AT WARNHAM COURT.**

[SEE SUPPLEMENTARY ILLUSTRATION.]

In our issue of September 28, 1895, the supplement represented a scene in the extensive and well-arranged rockery belonging to C. J. Lucas, Esq., and with the present issue is given another view of the same. In the meantime we have walked through this charming rock-garden on more than one occasion, and have always found in it a large number of showy and interesting plants in flower; the different plants in flower at each season, seeming to give a totally new aspect to the whole. The rockery is cleverly planted, and groups of the same genera are kept as much together as possible. Thus at one turn one comes on a fine display of the showier species of *Iris*, with the rock above them capped with *Saxifrages*; in another

cool moist nook are the blue-flowered *Gentians*, and beyond are patches of the early *Primulas*, such as *P. japonica*, with its variously-tinted flowers; the charming magenta-pink Indian highland *P. rosea*, the soft blue and lavender-coloured varieties of *P. denticulata*, and the clear yellow *P. verticillata*. At every point some distinct feature is observed, and in some parts the *Conifers* of smaller growth, and dwarf, flowering shrubs are very effectively used, while all around the fine rock-garden has the advantage of having, either in the near or far view, the noble trees which the estate possesses. A rockery amid such surroundings appears very different to what it would do if seen in an open field, or with a brick-wall for a background. The unsuitable surroundings of many expensively-arranged rockeries often prevent their becoming the objects of beauty their possessors intended them to be. The present has been a wonderful season in many respects, and its influence on hardy plants in rockeries and in the open garden has produced unusual results in the number of plants to be seen in flower; and it may be as well to name some of the most noticeable plants in flower in the Warnham Court rockery during the third week in April, and also remark on the flowers which first appeared in the year. This we are enabled to do by the courtesy of Mr. Duncau, the gardener at Warnham Court.

*Morisia hypogæa*, that pretty little yellow Corsican plant, was in flower in the open in January, since which it has continued in flower, it is likely to last much longer; the plant is said to succeed best if planted in full sun. In February *Narcissus minimus*, *Chionodoxa Lucillie*, *Leucojum vernum*, *Primula denticulata*, and *P. d. alba*, *Anemone fulgens*, *Hepatica angulosa*, some *Cyclameus*, *Saxifraga Burseriana*, *S. luteo-purpurea*, *Iris reticulata*, *Arabis precumbens*, and *Eria carnea*, all in more or less quantity, were in bloom on the rockery, the last-named and some of the others continuing in bloom until now. Beside the above-named, there were in flower during March, large numbers of the dwarf *Saxifrages*, including *S. Boydii*, *S. Rudolphiana*, *S. coriophylla*, *S. marginata*, and fine patches of the varieties of *S. oppositifolia*, which formed charming irregular masses of rose, purple and white flowers on the higher and more prominent pieces of rock. There is much variety in this handsome rock plant, and the best appeared to be *S. oppositifolia pyrenaica*, *S. o. major*, *S. o. splendens*, and *S. o. alba*. The month of March brought a fine show of flowers, including the varieties of *Anemone coronaria*, *A. pulsatilla*, and *A. blanda*, *A. apennina*, and other *Anemones*, while the *Primulas* were augmented by *P. Palinuri*, *P. Cashmeriana*, *P. marginata*, *P. pubescens*, and *P. spectabilis*. Early in the month there also flowered *Rhododendron præcox*, and one of the earliest and most beautiful species of *Tulip*—*T. Kaufmanni*, a species from Turkestan, with fine, creamy-yellow flowers, each petal having a broad cerise-scarlet band. If planted in sheltered but still sunny spot, and not disturbed, it is one of the finest early bulbs we have, but unfortunately it is still uncommon. *Soldanella alpina*, *Orobans vernus*, *Aubrietia Hendersoni*, and *A. Leichtlini*, *Omphalodes verna* and *O. v. alba*; *Daphne Mezereum* and the pretty *D. M. Paul's Snow-white*, all flowered during March, besides *Fritillarias*, and the usual and common spring flowers.

In April most of the things which flowered in March were still good, and there were also a great number of other species. Of the finest were the great bushes of *Andromeda japonica*, with its heavy load of graceful flowers. *Saxifodelus acutalis* also came well into flower, the larger *Saxifrages* (*Megaseas*) made a great show; the many varieties of *Primula cortusoides* and *P. auricula* displayed their handsome flowers, and some of the other showy things which are ordinarily not seen before early summer began to bloom. Among others, were *Shortia galacifolia*, *Primula ciliata* (*Balbisi*), *P. elatior*, *P. farinosa*, *Anemone trifoliata*, *A. ranunculoides*, *A. vernalis*, *A. nemorosa*, *A. palmata alba*, *Arnebia echinoides*, *Androsace sarmentosa*, *A. villosa* and other *Androsaces* *Lychnis pyrenaica*, *Viola biflora* and other *Violas*

*Tulipa oculis-solis*, *Phlox Nelsoni* and other dwarf *Phloxes*, *Daphne Cneorum majus*, *Onosma albo-roseum*, *Trillium grandiflorum*, *Iris pumila varieties*, the *Erythroniums*, *Hutchinsia alpina*, *Bryanthus erectus*, *Arenaria balearica*, *Dryas lanata*, *Draba borealis*, *Erysimum ochroleucum*, and various dwarf *Veronicas*, *Alyssums*, *Arabis*, &c.

The Warnham Court rockery may be pronounced to be a fine example of its kind, and one of the most interesting and pretty features in this large and well-kept garden.

## HOME CORRESPONDENCE.

**THE CROWDING OF HERBACEOUS FLOWERS AT SHOWS.**—I was very glad to read the protest of "D. T. F." (p. 494) on the excessive crowding of the flowers of herbaceous plants at the large exhibitions, and I hope that both show committees and exhibitors will take to heart the suggestions he makes therein. I noticed a bad case of crowding at Shrewsbury last year, and it was made all the more striking by reason of contrast with the floral designs, bouquets, &c., in another part of the same tent, or not very far off. These designs, &c., were veritable dreams of beauty, and to follow on with masses of herbaceous flowers put up in heavy bunches, sometimes not relieved by much or any foliage, was so incongruous, that many persons felt no desire to examine the latter. Heavy masses of colour, and, for the most part, strong colour, are wearying to the eye, especially when to this mass of colour is added the rounded or Cauliflower style of the bunches. One can understand that an exhibitor wishes to show off the wealth and the number of varieties of his collection, but this laudable purpose is defeated by overcrowding. Fewer flowers, lightly put together, and with some of their own foliage, makes a better and more acceptable presentation of them than the style "D. T. F." condemns. *H. L.*

**THE ORIGIN OF THE GARDEN CINERARIA.**—From a trial of seedlings raised from *Cineraria cruenta* in these gardens, the result favours the opinion held by the director of Kew and others, that the garden *Cineraria* originated solely from *C. cruenta*. In vol. xviii., p. 17, of the *Gardeners' Chronicle*, I referred to a single plant of *C. cruenta* then in flower in these gardens, and from which it was intended to raise seedlings and grow some of them on for the purpose of noting if any variation took place amongst them. Forty of these seedlings have now flowered, and almost all of these differ from each other in colour of flowers, and in habit of growth. The plant from which these seedlings were raised was not pollinated by *C. lanata*, as that species did not flower in these gardens last year; but as I have remarked in the note referred to above, the plant may have become pollinated with pollen from the garden *Cineraria*, as they were in flower at the same time, though if this happened it was not by design. Judging from the varieties which we have raised from this single plant of *C. cruenta*, it would not be a work of many years duration before one could obtain by judicious selection and good cultivation a strain of *Cinerarias* from them, similar to those of the florists' varieties. The plant of *Cineraria cruenta*, from which these seedlings have been raised, was presented to these gardens by the regius keeper of the Royal Botanic Gardens, Edinburgh, and had the appearance of having been raised from a cutting. The seedling plants are much more vigorous and floriferous than the parent; they are particularly well-grown, the foliage being strong and more lasting than that of the garden *Cineraria*. The habit of the plants varies from compact neat specimens about 18 inches in height, to others 3 feet 6 inches, with loose spreading heads of flower 2 feet 6 inches in diameter. The diameter of the flowers vary from 1 to 2 inches, and particular attention should be drawn to their floriferousness; 684 buds and flowers were counted upon one plant, and there are several like specimens. I am sending you by post some sprays of some of these seedling forms of *C. cruenta*. *W. Harroun, Curator, Botanical and Horticultural Society's Garden, Sheffield.* [The specimens sent showed obvious traces of having been pollinated with flowers of the garden *Cineraria*. Ed.]

**STEAM LAWN-MOWERS.**—On p. 495, your correspondent, Mr. A. J. Knapp, shows a strong desire to see steam-engines applied to lawn-mowers. To a

practical man the question arises, are they necessary? In the case of private gentleman's pleasure-grounds the lawn mower, whether propelled by manual or horse-power, is a most efficient implement. It is also more in harmony with rural surroundings than one propelled by steam-power would be. Should it be a question of economy, the price of a steam lawn-mower would pay a couple of good labourers for a year. Mr. Knapp speaks feelingly of the toiling labourer, working an 18-inch machine, but such work in the open air would hurt no man. Of course, the iron-horse on the iron-road is an important factor in our daily life, but we still want a few quiet corners where men have time to think and grow young again; and we do not want all the land covered with iron-roads, steam-engines, and cinder-heaps. *R. M., Newbury.*

**BEES SWARMING.**—My first swarm of the season came from a straw-peg on April 21. This is the earliest I have heard of in this neighbourhood. *South Bucks.*

**THE LARCH DISEASE.**—In continuation of my remarks on the Larch disease on p. 494, I prefer rather to run the risk of repeating some of the things that I have said than to fail to make myself sufficiently understood. I have already said that I consider the blister in the Larch as being emphatically a bark disease; that is to say, it originates in the bark, and develops in the bark. Unfortunately, it does not always end there, but on the contrary, it frequently extends so as to destroy the tree. The blister originates in early spring. There appears scarcely any room for doubt that, at all events, it takes place while the sap is in active movement, neither before the sap begins to flow, nor after it has passed the active flowing stage. In proof of this, we have only to look at the zone or ring of the last-formed layer of wood, and we there find that the blister-fungus has not in any way penetrated or injured it, but has entirely confined its development to the bark outside the last-formed layer. It is not, however, to be inferred from this circumstance that in no case does the blister ever indirectly cause any woody part of the tree subsequently to rot and decay; on the contrary, if the wound in the bark is large, and spreads over a considerable surface of the stem of the tree, under these circumstances the wood necessarily remains so long open before the new bark and cambium can possibly cover and protect it, that the elements in process of time dissipate the resin, which for long protected the wound, but now leave it exposed to the natural processes of decay. This, however, is not a very common occurrence, and were it the only evil connected with the blister, it might well be regarded as only of minor import. The most serious aspect of the malady probably consists in the wound caused by the primary decay of the bark remaining open so long, that malformations of a very serious nature are thereby formed upon the stem of the tree. These excrescences, on which the commercial value of the tree almost entirely depend, are as varied in form and size as can possibly be imagined or conjectured, but on which I need not here enlarge, as every forester too well knows these grotesque and sometimes loathsome appearances. The origin of the disease lies deeper, more concealed, and obscure—so hidden, indeed, that to many the disease in its embryo state is but little known or suspected. As already said, the disease evidently begins in April, or not later than the first few days of May, and the first signs of it are revealed by breaking the surface of the bark with the point of a knife, when the well-known dark cinnamon colour of the inner bark presents itself, which has already been deprived of its vitality, and the disease established beyond remedy. Another form of disease which must not be mistaken for the blister, consists in the sap or resin oozing through the bark and running down the stem in streams. This, however, does not often terminate seriously or fatally, and is caused by widely-different influences, which may be subsequently explained. Sometimes one spot or patch of injured bark is found on a tree and no other part is affected, and this point most commonly occurs at from 12 to 18 inches from the surface of the ground, and if it does not extend quite round the tree, there is as much sound and healthy bark as constitutes an unobstructed channel for the sap to ascend; in such cases the tree survives and outlives the injury, and in process of time it almost, if not entirely, disappears, nor is it either seen or heard of again till years afterwards, when the tree is sawn up, when the long forgotten and hidden ills are again brought to light. In other cases the wounds are not single but numerous upon the stem, which

most frequently they are, and not confined to one side of the tree only, but exist on all sides; sometimes the wounds are large, and in other cases small, and of every shape and form. That the producing cause of blister is cold and damp I am fully persuaded, but opinion or assertion is not proof, such as anyone is entitled to ask for, and which the writer will endeavour to give in a subsequent contribution. *C. Y. Michie, Cullen House, Banffshire.*

**BITTER ORANGES.**—Seedling Oranges rarely attain to a fruiting state in this country, owing to lack of room and patience for their development, and the theory mentioned by Mr. Wolley Dod cannot, therefore, be easily tested here; but I have tasted Oranges from hundreds of seedling trees in Florida, and have not found one of them bitter—in fact, this mode of raising them is preferable for groves in the long run. And although trees budded with improved varieties fruit much quicker than seedlings, still they do not attain to the size and productiveness of the latter. The bitter Orange is occasionally met with out there, and is chiefly used for planting by the roadsides as an avenue tree; but the Evergreen Oak, called there "Live Oak," is generally used for this purpose. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

—A distinguished correspondent in last issue enquires whether the belief of some gardeners that "Orange trees raised from seed of a sweet Orange produce bitter fruit unless grafted on a sweet Orange-tree" is correct. This is a popular fallacy. The seedling either more or less from the parent variety, and improved sorts have thus been obtained. Grafting is resorted to not for the purpose of improving the flavour, but to induce fertility and to perpetuate well-known sorts. The seedlings are used for stocks, and varieties of proved excellence are grafted upon them just as choice varieties of Apples are grafted or budded upon stocks raised from seed or cuttings. The origin of the sweet Orange is lost in pre-historic obscurity, and certain varieties have become so fixed that they come pretty true from seed, and bear sweet Oranges without grafting, but they are longer in coming into fruit if allowed to grow naturally. *W. Roupeil.*

—In answer to C. W. Dod, in *Gardeners' Chronicle*, p. 527, I may say that seedlings from the sweet Orange do not always bear bitter fruit; and an example proving this fact can be found in the gardens of C. D. Cave, Esq., Sidbury Manor, Devon. A seedling sown by one of the family when at school bore a crop of ten or twelve very handsome fruit in the year 1892 or 1893, which were considered by all who tasted them to be remarkably sweet and of good flavour. It was named Edith, and received a Certificate from the Royal Horticultural Society. *R. Carter.*

**NARCISSUS BARRI CONSPICUUS.**—We send herewith two stems of *N. Barri conspicuus* with two flowers on each stem. We have never noticed this before; while this season a large number are coming the same as the enclosed. Perhaps some of your readers may have noticed the same occurrence. *Pope & Sons, Birmingham.*

**FLOWERS IN REGENT'S PARK.**—I was much pleased to observe the notice of the flower-beds in the last issue of the *Gardeners' Chronicle*, and especially so to find *Viola Bullion* so much used. It is quite the best early yellow *Viola*, although raised by me nearly twenty years ago. About *Saxifrage Camposei*? I trust the enclosed paper on its history may be useful, and if you can find a corner for it in your paper you will oblige. *J. Griev.*

**BORDER AURICULAS.**—Without doubt, the alpine *Auriculas* exhibited the other day at the Drill Hall were the best of their kinds grown in the kingdom, and were exceedingly beautiful. I fear that few, if they had been grown out-of-doors, would have been from a show point of view, presentable. On the day following the show, I came across a charming display of hardy border *Auriculas*, right in the midst of Kingston-on-Thames, and the sight was as much a surprise as it was pleasing. Kingston has its share of sooty and other impurities, and being riverside lies somewhat low, yet here was seen quite a large and varied collection of these plants blooming as finely, as fresh, and as beautiful as they could have done in any garden in the kingdom. I found on enquiry that the grower was Mr. Shepherd, one of the partners in the firm of Puttock & Shepherd, the garden being attached to his private residence.

The show, if it may so be called, was at once a tribute to the worth of the border Auricula as a town plant, and also to its great fitness for spring-flower decoration. The strain, though many coloured, has the merit of having good stiff flower-stalks, not always the case in Auriculas, the flowers being thus boldly held up to view. Then all the plants were

**THE TEMPLE SHOW**—An enthusiastic reporter recently referred to one of the Drill Hall exhibitions as "grand." If he employs such expressive adjectives in that case, he will probably find his store of these useful superlatives exhausted when he visits the forthcoming show of the Royal Horticultural Society in the Temple Gardens. That exhibition, it

continues favourable, there will be a formidable addition to the country visitors. The Temple show is literally the horticultural May meeting, but it is far more bright, beautiful, and cheerful than is the majority of those gatherings. It has the misfortune, however, to occur at a time of the year when all gardeners are very busy with bedding-out. But not

FIG. 87.—RHODODENDRON SCHLIPPENBACHII.

(Colour pale rose, with a few spots at the base of the upper segments. Shown by Messrs. J. Veitch & Sons, Chelsea, at the Royal Horticultural Society's Meeting on April 21.)

blooming simultaneously. Somehow, gardeners largely fight shy of border Auriculas, being perhaps too much under the impression that they need considerable attention. That is so far from being the case, that once strong enough to plant out, few plants need so little care. Seed should be obtained and sown at once in shallow pans and on fine sandy soil, keeping the pans slightly shaded, and the soil just moist. If growth is slow, give patience, and there will later be ample reward. *D.*

may be taken for granted, will show no defections, but probably many embarrassing additions. It is interesting to note how much interest in this great show, literally the greatest flower show in the kingdom, has grown up in the country districts during the past two or three years. Gardeners and others who have not yet visited the Temple, but have read the reports of the exhibitions annually furnished in the papers, have had their minds much stirred, and there is every prospect that this year, should the weather

only is the Temple show the great floral gathering of London, but it can fall but once a year, and that in the early summer. Because, too, of its singularly representative character, myriads of things may there be seen literally, as it were, under one roof that cannot be met with in the same variety at any other flower show in the kingdom. The show, too, is held so literally in the heart of London, that it is most accessible to every one, and, as it were, near to everything. Thus, even in

these respects, advantages are offered not to be found elsewhere. As a meeting-place for the gardening clans it is unique. But it is to be desired that some things open to criticism in relation to the show might be amended. There is the always interesting matter of refreshments, the supply and cost of which compares so surprisingly with what is charged, or facilities furnished, outside. That is, perhaps, after all, a small matter to some, but not so to gardeners. There is the matter, also, of some needful form of reception which seems to be desirable at such a gathering, though to enable that to be carried out, a special tent would be needful, and two or three members of the council told off to act as M.C.'s. Many country gardeners and others who visit the show find themselves distressingly isolated, from lack of some sort of introduction. A large tent so utilised might also be employed for an hour during the first or subsequent afternoons in holding Council receptions, where visitors might be welcomed, and the work of the Society be explained. Anything like a formal conference, or the reading of papers, could not be too strongly deprecated. In the arrangement of the show, it is most desirable that, as far as possible, long, formal, straight tabling and banks of plants and flowers be broken up, as the monotony hitherto seen in that direction soon becomes most wearisome. Exhibitors who foolishly cram their collections to the utmost do themselves great harm, whereas those who aim at securing striking effects with less material, charmingly displayed, arrest attention, and greatly benefit. It is time now that in all the arrangements, whether of individual groups or of the show in its entirety, greater efforts were made to secure pleasing grouping and charming effects, and thus serve to make the exhibition more attractive. A. D.

**THE ROYAL HORTICULTURAL SOCIETY'S RULES FOR JUDGING.**—I have looked, but looked in vain, for a reply from some of the many members who formed the committee of the Royal Horticultural Society to draw up the new code of rules for judging, to the searching criticisms of "Ayrshire Lad" and "Iro Bono Publico," in the *Gardeners' Chronicle* of April 4, p. 436. The members of that committee are all men of knowledge, with good gifts of speech; many of them ready with the pen, and yet, none of them seems willing or able to reply to the criticisms of your two correspondents. "A. D." has valiantly done what he could in explanatory notes on the new rules since they were published, but even he shrinks from tackling these doughty champions on the points they have so forcibly brought up. When one looks through the list of names of the committee, one is astounded at the silence they maintain. Surely, there is something to be said on the other side? H. L.

**NEWLY DUG-UP CLAY SUBSOIL.**—I noticed some time ago in these pages a query on the subject of clayey subsoils. Now I have had a good deal to do with breaking-up clay soils in my time, and once made a rash experiment for which I had to pay dearly. I took charge of a garden which had to be extended into an old pasture; and I was well aware at the time of the effect of bringing up a clayey subsoil to the top, namely, that it would be so infertile that no plant would thrive on it until subsoil was incorporated with the old top-soil. But in this case the subsoil looked of such excellent quality that I thought it might be trenched to the depth of 14 or 15 inches, a depth that was really required to get the long grass properly buried. As the work could be done early in the autumn, and no crops would be put on it till the following spring, a presumably reasonable time for frost, wind, and rain to act upon it with good effect. The soil became workable, having been well pulverised by these influences, but nothing would grow upon it; and seeds, which vegetated freely, came to nothing, and dwindled away. The seeds sown consisted of Peas, Parsnips, Carrots, Onions, Beans, &c. As the soil was heavy and lacked lime, I had it trenched once more, and before cropping it I afforded it a good dressing of newly-slaked lime. It will now grow any kind of crop from Parsley to Carnations. If anyone can afford to leave newly-trenched ground fallow for one season, the above is an excellent plan to get it into good heart; and in the event of its being left fallow for a year, it may be trenched much deeper than 14 or 15 inches. The plan to adopt, if it is intended to crop the ground soon after turning it over, is to bastard-trench it, that is, to dig up the top spit, and also shovel out the loose earth. The subsoil can be forked up to the depth of 8 or 9 inches more, but leave it in the bottom, then turn over the

top spit of turf and soil, and repeat the process of digging up the subsoil; and although but 10 inches or so of the maiden loam be turned up, the complete success of anything planted or sown upon it cannot be assured the first season after; and it conduces to better results if some old fertile garden soil be put on it before sowing or planting. I bastard-trenched about an acre of good soil (meadow land) two years ago, and was very successful with all kinds of crops the same season. Fruit-trees and bushes had good soil placed immediately around their roots; Peas when sown had the drills filled in with siftings from the potting shed; and Onions, Carrots, &c., were treated in a similar manner. A gardener has sometimes to deal with infertile subsoils turned up to the surface by someone else, and if the extent of the surface is not large, it might not be difficult to afford a dressing of rich fertile soil; a layer 3 inches thick of this kind of soil and rotten manure in equal portions would, if lightly dug in, give a good start to almost any kind of plant. Manurial mulchings would be helpful likewise in the summer. J. Douglas.

**COLOUR IN APPLES AND PEARS.**—It is well known to market-men that high colour will sell an otherwise inferior variety of Pear or Apple, the popular belief still holding that high colour goes with fine flavour always. The connoisseur, however, knows better, preferring even a greenish Ribston or Sturmer Pippin to, say, Kerry Pippin, Worcester Pearmain, or Devonshire Quarrenden. It is the same with Pears; for what looks more enticing than sunny-brown tinted fruits of Beurré de Capiaumont, the red-brown cheeked B. Clairgeau, or the rich golden Gansel's Bergamotte, which not every gardener is competent of selecting just at its best? Compare these with the uninviting fruits of Beurré Bosc, B. d'Anjou, Brown Beurré, &c. Which section of the public are we, therefore, to cultivate for—the many, who do not know a good fruit when they see it, or the expert, who does? As a matter of food it does not matter a straw whether the buyer of an Apple or Pear is satisfied with a poor or a good-flavoured fruit, and the verdict will be given in favour of the more productive varieties of high colour, irrespective of flavour. It has always been so; the best for those who can afford to pay the high prices demanded for good fruit, and the inferior for those whose means are slender. Those who write for the gardening press, who give lectures at country gatherings, and prospective planters, should bear this fact in mind, and not beat the air. In the good time coming we may get enormously productive varieties of large size, the finest flavour, and of the richest colouring; but until that time has arrived, the market grower will continue to plant for the masses. All the same, the systematic cross-breeding of Apples and Pears should be diligently carried on by our Rivers' and Pearsons', by County Council Research Stations—when we get them: [at Chiswick] and, above all, by amateurs. There are two or three points besides those I have mentioned: the variety should bloom late, i.e., the bloom should have leaf-protection, the fruit be capable of long keeping, possess travelling properties, and a small core. *Pyrus Malus*.

**MULCHING.**—The application of farmyard manure as a mulching to fruit-trees is the best stimulant that can be applied. There is nothing so difficult to estimate as a cart-load of manure, for it may contain a readily available amount of plant-food, or it may be no better than decaying straw, especially if it be incapable of fermentation when thrown in a heap. Mulching with manure is good practice when applied to late-planted trees, and during the summer as a conservator of moisture; but as a fertiliser, I have a poor estimate of it. During the past winter I have seen many examples of fruit-trees surrounded with heaps of manure, sealing up the land and consequently the roots from the healthy influences of the atmosphere, and in no way being of any use. If I had a fruit-tree to manure, and were offered the choice of a load of ordinary manure or a bushel of dry soot, I should accept the soot, with the certainty that it would benefit the trees and give added colour to the fruits. I am somewhat surprised at the remarks of "A. D." (p. 465) on this subject, as he seems to give more credit to warmth at the root as a producer of high colour than to soot. As a fruit-grower, I can see no difficulty in giving credit to the soot for the improved appearance of the fruit. It may be said that in support of my contention that soot contains a good percentage of ammonia, one of the best kinds of manure for fruit-trees, and a soil containing appreciable quantities of ammonia means

increased action in the roots, and consequently healthy growth and well-finished fruits. And when there is dark-green healthy leafage and high colouring and finish in the fruits, we have also good flavour. Light, temperature, &c., also exert an influence on the colour of fruits. J. R.

**APPLE ANNIE ELIZABETH.**—Your report of the proceedings of the Fruit Committee of the Royal Horticultural Society at the Drill Hall on April 7th mentioned the fact that some of the members of the committee objected to the granting of an Award of Merit to this fine Apple on the ground that the variety is a shy bearer. But even that seems to be very much a matter of opinion as well as of experience. For instance, Mr. C. W. Cummins, who has had large experience of Annie Elizabeth at the Grange, Hackbridge, spoke of it as being a heavy cropping variety. I have seen it growing and fruiting well in other places, and the trees are always robust and healthy. The growth is erect, and if found widely sparse in cropping, perhaps the vertical form of growth may have something to do with it. Still, other vertical-habited varieties prove to be very good fruiters. It is, however, an excellent variety for certain kinds of soil. Only a few days since I saw several fine clean standard trees growing on grass at Hackwood Park, Basingstoke, each tree having been about six years planted, and these trees had borne, I was told, a nice crop of fruit last year, and are now covered with blossom-buds. Mr. Bowerman is pleased with its excellent cropping qualities, its fine clean fruit, and long keeping. A. D.

**THE USE OF TEAK IN GLASSHOUSES.**—I read the note on Siamese Teak on p. 456 of your issue of April 11, with the more interest that I was fresh from an inspection of the beautiful conservatory erected by Mr. Frank Lloyd in the garden of his Croydon residence, Coombe House. This noble building is constructed throughout of Teak, and I think it probable that if the extraordinary durability and handsome appearance of the wood were better known, it would be far more extensively used for horticultural buildings than is the case at the present time. One of the most important points in its favour is, that it requires no painting; a coat of varnish every eight or ten years being all that is needed. When it is remembered that the time-honoured "well-seasoned yellow Deal" needs its four coats of paint in the first place, and to be painted at least every three years subsequently, it will be seen that although the first cost of Teak is greater than that of Deal, it is not more expensive—probably less—in the long run. As a guide to the difference in cost, I may note that the original estimate sent to Mr. Lloyd was for a conservatory constructed of St. Petersburg redwood, and that the subsequent decision to employ Teak instead increased the cost by 13 per cent. Mr. Lloyd has a range of stoves likewise constructed of Teak, and from a practical point of view, its advantages for such houses, with their increased moisture and heat, are proportionately greater than for cooler and drier structures. However, it is impossible to stand in the spacious and lofty conservatory at Coombe House without being struck by the peculiar appropriateness of the brown wood in the case of a structure entered from a drawing-room. It is at once refined, subdued, and harmonious. It should be noted that in the early stages of its use in glasshouses, the Teak in parts becomes discoloured, arousing disquieting fears of incipient decay. The wood, however, is perfectly sound, and the discoloration is merely a sort of "sweating" (I trust the editor will pardon a rather loose term), the effects of which are easily washed off. But for my fear of trespassing unduly on valuable space, I would add a few lines about the gardens at Coombe House. It is particularly gratifying to observe with what liberality, combined with judgment, provision has been made for improving the herbaceous borders and shrubberies, which promise to become amongst the most beautiful in the country. Possibly, this is not a little owing to the influence of a valued friend and neighbour in the person of the Rev. W. Wilks, W. P. Wright.

## TREES AND SHRUBS.

### PARROTIA JACQUEMONTIANA

Of the two species of Parrotia known to botanists, one (*P. persica*) is a native of Persia; and the other (*P. Jacquemontiana*) is found in Kashmir, Afghanistan, &c. The former of these is fairly well

known, at any rate, by repute, a figure of a flowering twig having appeared in the *Gardeners' Chronicle* for March 18, 1893; *P. Jacquemontiana* is, however, a rarer plant. It is flowering now in the collection of Hamamelidaceæ at Kew. It is a small tree, attaining a height of about 12 feet, and in general aspect resembles a Hazel. The leaves are elliptic-obovate, 2 to 3 inches long, the margins crenulate, and the lower surface covered with a stellate pubescence. The flowers, which are small and yellow, are borne in a conical head, the base of which is surrounded by broad, dull white bracts, which are  $\frac{3}{4}$  to 1 inch long. It is to them that is due whatever value as a flowering tree this species may possess. This year they have been injured by hail and frost. In Kashmir this *Parrotia* is very abundant, and shares largely in the formation of the dense shrubby jungle. Its stems and branches are used for making wicker-work.

#### PRUNUS (CERASUS) PENDULA.

This Japanese Cherry is one of the most lovely of all spring-flowering trees. It is of naturally pendent habit, several young trees at Kew having been raised from seed, whose branches have quite as decided a downward tendency as those of the worked plants sent out from nurseries. During the past week or two the species has been fully in blossom, and the profusion of its flowers, combined with the graceful habit, give it a singular charm. Each flower is about half an inch across, and of a beautiful soft pale rose. Professor Sargent says that, although he never saw it wild in Japan, cultivated specimens, 50 to 60 feet, are not uncommon in the old temple gardens of that country. *W. J. B.*

#### RHODODENDRON NIVEUM.

This variety is perfectly hardy at Belvoir, but in my opinion it is not so pretty as other hybrids, its flowers being too closely packed together, and the colour poor. The other Himalayan varieties which we have outside, viz., *R. Falconeri*, *R. campanulatum*, and *R. Thomsoni*, are far preferable as regards the effect which they make. The latter variety was lately described as a red *Lapageria* by a lady who noticed it in flower, its colour being very similar to that flower, and it is perhaps the finest hardy shrub that we have in flower at the present time. When not in flower the peculiar glaucous foliage of *R. Thomsoni* is distinct and telling, differing from that of most *Rhododendrons*. *R. campanulatum* grows to a large size here—about 10 feet high, and is worthy of being extensively planted where sheltered positions can be found for it. The brown colour of the lower side of the leaves shows well during the winter when the plant is moved by the wind. I hope to try other *Rhododendrons* of this class, and shall be glad to hear of varieties which are known to be hardy and worthy of cultivation. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

#### SALIX HUMBERTIANA VAR. FASTIGIATA.

*M. André* in a recent number of the *Révue Horticole*, April 16, gives an illustrated account of this Willow. *M. André* met with the tree on the Andes of Colombia, and managed to strike some cuttings in bottles of water, on his way home. These were planted on his arrival in the South of France, and have grown well. It is of fastigiate habit, like a Lombardy Poplar, and is a valuable introduction for the South of France. The leaves are exceedingly narrow and pointed.

#### THE DWARF LEBANON CEDAR (CEDRUS LIBANI NANA).

There is growing in grounds adjoining one of the oldest parks at Hemel Hempstead, a specimen of this dwarf and interesting Conifer—a variety that probably has not been heard of since Loudon's time, just half a century ago. The specimen in question is only 4 feet high, and about the same in spread of branches, obtusely cone-shaped, and abundantly supplied with the healthiest of foliage. The flattened, horizontally-arranged branches readily reconcile it with the species, the only difference being that these are so thickly produced one above the other that the hand cannot be passed between any two, this giving the plant a dense, somewhat stiff appearance,

that is further augmented by the almost uniform length of the branches. There is no perceptible difference in the foliage from that of the species; perhaps generally the leaves are shorter, and decidedly sharper, and average between three-fourths of an inch and one inch in length. The plant in question must be of considerable age, as the gardener told me that it had hardly increased in size during the eighteen years he has had charge of the place. This must therefore be considered as a real dwarf

FIG. 88. A VARIEGATED CUCUMBER.

form, and as it is of neat growth, and of a pleasing dark bluish-green tint, its propagation and dissemination is more to be desired than is that of many so-called pigmy Conifers. *A. D. Webster.*

#### ILEX DIPYRENA.

I send a flowering specimen of *Ilex dipyrena*. The specimen is taken from a plant 12 feet in height, and is well covered with flower all over. I have never before noticed the plant in flower till this year. It is probable the mild winter has got something to do with its flowering. *M. Chapman, Easter Duddingston, Portobello.*

## VARIEGATED CUCUMBER.

MESSRS. WALTERS & RENTON, of the Goff's Oak Nurseries, Cheshunt, send us the remarkable Cucumber shown at fig. 88. One-half the fruit was green, the other half yellow, from defect of chlorophyll. It is noteworthy that the whole plant was parti-coloured in the same way, stem and leaves being yellow or white on one side, green on the other. From the white side were also produced two wholly white fruits, which are still hanging. Why the cells on one side should develop green colouring-matter, whilst those on the other are devoid of chlorophyll, is more than we can explain.

## NURSERY NOTES.

### MR. J. CYPHER'S, CHELTENHAM.

FEW horticultural establishments can boast of such a wide range in their operations as the Exotic Nurseries, Cheltenham, and few have attained to so great excellence in the subjects undertaken as Mr. James Cypher, with the assistance of his son.

There the humble bedding plant, the showy exotic Orchid, Gardenias, Roses under glass, and other things useful in the extensive cut-flower business, are grown in profusion and in first-rate style. There the giant specimen stove and greenhouse plant, both flowering and foliage, occupy many large houses, and are grown to perfection, as visitors to flower shows all over the country can testify. This stronghold of the specimen exhibition plant seems to form a link between the modern flower show, with its endless groups of small plants, "arranged for effect," and those of the past, when giant specimens were the only things deemed worthy of consideration. Neither is the hardy plant department neglected, for in the newly-added 3 acres the herbaceous perennials and shrubs are grown; but even there, in a glass-house, are the huge specimens of *Erica Cavendishii* and other New Holland plants in training for coming events.

About sixty commodious, well-ventilated houses, chiefly span-roofed, are devoted to plant-culture, and of these a goodly number are filled with

### THE ORCHIDS.

And here it may be remarked that a great attraction, apart from the healthy appearance of all the plants, is given by the artistic arrangement of the plants in flower. Evidently at home as well as at flower shows, Mr. Cypher wishes to keep good the oft-repeated remark, "Cypher flowers his things well, and makes the most of every one of them in staging." As an example, in the first house we entered, we found a most charming display of the slender *Epidendrums* arching over from the stage to the highest point in the roof, and composed of fine specimens of the scarlet *E. radicans*, the purple *E. evectum*, and the bright red *E. O'Brienianum*; together with smaller plants of the chrome-yellow *E. xanthinum*—a most charming arrangement. On the centre stage was a group of *Cattleya Lawrenceana*, some with seven to nine flowers on a spike; some good *Laelia purpurata*, and *Cattleya Mendeli*, and one fine specimen of *Laelia-Cattleya* × *Schilleriana superba*, with very large bluish-white flowers, with crimson-purple labellum.

In the next intermediate-house were many examples of *Cattleya citrina*, with their pendent, fragrant yellow flowers; and a group composed of a noble specimen of *Cymbidium Lowianum*, *Cypripedium exal*, *C. villosum*, *Maxillaria venusta*, *Epidendrum vitellinum*, *Platyclinis glumacea*, with here and there the pure white heads of the yellow-centred *Dendrobium infundibulum*. In the next, a cool-house, at the entrance is a bright-looking batch of the dark rose *Pinguicula caudata*; a nice lot of *Odontoglossum crispum* and *O. Pescatorei*, some very fine *O. Hallii* and *O. luteo-purpureum*, fine spikes of *Halcidium macranthum*, &c.; and, suspended overhead, plants in flower of *Masdevallia Chimera*, *M. bella*, *M. Shuttleworthii*, *Nanodes Medusa*, *Odontoglossum Cestatii*, *O. Cer-*

vantesii, O. Rossii majus, scarlet Sophronitis, and other dwarf-growing species. In the following house we found a good show of Cattleya Schroderae, C. Mendeli, and C. Trianoi, the last-named going out of bloom, and the C. Mendeli just coming in. Here also in bloom were Chysis bracteata, Trichopilia crispa, T. suavis, Oncidium luridum, O. sarcoades, Zygopetalum maxillare, Oncidium obryzatum majus, and other Oncidiums, &c.

Dendrobiums are the great specialty at the Exotic Nursery, and in growing them and in raising new hybrids, Mr. Cypher is an adept. The many forms of D. nobile get a great deal of attention, and for some time past have made a splendid show. Some of the best noted were D. nobile nobiliss, of which one was a noble specimen; D. nobile Cypheri, one of the prettiest and most perfectly shaped; D. n. elegans, one of the oldest and still one of the most beautiful; and one other variety had very pretty white flowers with light-red tips to the petals. Of the hybrids raised here, the richly-coloured and large D. × Rubens, the very fine D. × Apollo, and D. × Ainsworthii, Cypher's variety, appear to be the handsomest, though there are large numbers of seedling Dendrobiums, Cattleyae, Laëlio-Cattleyae, Epiphronitis, and other things coming on, which will have every advantage in developing their best features under the careful treatment they will receive. Of other Dendrobiums in flower were noted a fine lot of D. Wardianum and D. crassinode, and among the latter a very large form which bore evidence of being a cross between the two, though the flowers still appeared to be those of a very large D. crassinode; the yellow D. dixanthum; a very fine D. fimbriatum ocnlatum; D. superbum, D. primulinum, D. nobile Cooksoni, D. × Venus, D. crystallinum, D. Devonianum, D. × Nestor, D. × splendissimum illustre, D. × Cassiope, D. lituiflorum, D. × Aspasia, and several varieties of D. Phalaenopsis Schroderianum, which here grows luxuriantly in a warm moist house in full sun with the D. bigibbum and others of that class, which do so well with Mr. Cypher.

In the Cypripedium-house were many of the newer hybrids in bud. In flower were Cypripedium villosum and C. villosum giganteum, well named for the strength of its growth and size of flower; C. Boxallii, varieties of C. × Lathamianum and C. × Calypso. Some fine C. Rothschildianum, C. Chamberlainianum, C. × vernixium, C. × Lecanium, C. × Lancheanum, C. × Carnusianum, C. × euryandrum, C. × selligerum, and a great number of Selenipediums of the S. × Sedenii class. Suspended overhead were some fine plants of Cœlogyne tomentosa, with long racemes of salmon-coloured flowers; C. Massagœana, and the fragrant white Angreœum leonis; while in another house the Sobralias, and fine forms of Vanda tricolor and V. suavis, were coming into bloom.

In the lesser Odontoglossum-house, the varieties of Odontoglossum Pescatorei were remarkable; also there were good forms of O. cordatum and O. maculatum, both remarkably pretty when well grown; O. nebulosum, O. odoratum, O. triumphans, O. Hallii (one of which had twenty-one flowers on a spike), and a number of varieties of O. Andersonianum, as well as many Maslevallias. Suspended overhead were a number of the form of Sophronitis grandiflora usually called coccinea, one of them being of a very peculiar dark reddish-crimson hue, and also of fine form. Here the cool-house Oncidiums, such as O. encellatum, were in bloom, and one plant of Odontoglossum ramosissimum bore a fine branched inflorescence.

Other houses contained the good stock of Miltonia vexillaria, Acrides, Phalaenopsis, &c., and

#### THE EXHIBITION PLANTS

filled several large span-roofed houses, and seemed to be coming on well for the summer shows. The Crotons are becoming brilliant in colour, the large Ixoras producing fine heads of bloom, and the Bougainvilleas and other gigantic specimens promise well. Among the Bougainvilleas is a new form, stronger in growth than any of the varieties of B. glabra, and

more floriferous, while the floral bracts are much redder and darker in colour, and it is said that they are more persistent, and therefore travel better either as specimen plants or cut sprays.

Glancing at the contents of some of the principal houses, we remarked two very large houses filled with specimen Palms and Cycads, a like number of large New Holland Plants, Pimeleas, Tremandras, Boronias, Ericas, &c., a house or two of specimen Azaleas and one of smaller ones in flower, a house in which the plants (or trees, as they might be called), of Tabernaemontana coronaria, fl.-pl., covered with double white Gardenia-like blossoms, and the equally fine Gardenias, showed where a goodly supply of the cut flowers for the two dozen or so bouquets, wreaths, and crosses just ready to be sent out came from.

In this work, too, the house of Niphotos and other Roses, and the large batches of Lilium Harrisii, and the seemingly endless supplies of Stephanotis on the roofs of the warm-houses also play an important part; and corresponding quantities of Maidenhair Ferns and Asparagus plumosus, &c., are provided. Another pretty display is made in the house containing the scarlet Anthurium, of which A. Scherzerianum Cypheri is by far the largest and most richly coloured; and in that in which the greenhouse Rhododendrons, such as R. fragrantissimum, R. Veitchii, and the varieties of R. Gibsoni and R. variegatum, R. Countess of Haddington, &c., are in bloom.

Mr. Cypher holds that whatever is worth doing is worth doing well, and that good culture may often redeem a slighted subject; and in every department of his compact nursery evidence in proof of it is to be seen.

## SOCIETIES.

### ROYAL HORTICULTURAL.

#### Scientific Committee.

APRIL 21. — Present: Dr. M. T. Masters (in the chair); Mr. McLachlan, Mr. Michael, Rev. W. Wilks, Dr. Müller, Mr. J. T. Bennett-Poe, Mr. Douglas, Dr. Bonavia, and Rev. G. Henslow, Hon. Sec.

*Primulas, Auricula × Alpine.*—Mr. Douglas exhibited a very interesting collection of hybrid Primulas, between the "Show" (P. Auricula) and the "Alpine" (P. pubescens, according to Mr. Baker). The former was the pod bearer. They were all raised from the fruit of one truss, and presented a considerable amount of variety in the foliage and the colours of the flowers. The mealiness was much reduced, and indeed nearly absent from the leaves. Two specimens exhibited curious abnormal conditions, upon which Dr. Masters will report. It was stated by the late Mr. Shirley Hibberd, at the Primula Conference in 1886, that in his opinion these two classes of Primula would not cross, but he observed that "no man was so competent" to experiment upon them as Mr. Douglas, who had this completely negated Mr. Hibberd's surmise.

*The Bardfield Oxlip.*—Mr. Henslow exhibited specimens of this plant received from Mr. J. French, Felstead, Essex, with a communication containing his observations on the variations of plants under the influence of their environments. With reference to the genus, Primula, he observes, "An instance of 'bog' modification is that of the Bardfield Oxlip (P. elatior). This in bog land would be unrecognisable to the ordinary observer. There are acres of boggy pastures at Great Bardfield, where every plant of this species has but one flower to each peduncle, and a small rosette of leaves resembling Celandine more than Primrose. The common Paigle (P. veris) lives in the same meadows unchanged. It is, therefore, clearly in the capacity of the Oxlip to be moulded by its environment alone." With regard to hybridisation Mr. French notices that while "Primroses stand themselves tolerably well alone, and also remain constant or very nearly so [in a garden], as they do in the wild state, when you put them in company with the Oxlips (unless I am mistaken altogether in my observations), a different arrangement will ensue. The Oxlips still remain unaltered, for the Bardfield Oxlip cannot be changed by crossing, whereas the Primrose and Paigle are both very unstable; but the seedling Primroses will gradually (that is, in the course of four or five seasons) very materially change, and that apparently without any fixed law. The petals may or may not alter their colour or become foliaceous; the corolla may put on the form known as 'hose-in-hose'; the peduncle will almost certainly be lengthened, and the typical Primrose leaf will gradually vanish and give place to a form intermediate between that of a Primrose and Oxlip; the leaf, in fact, will be the only hybrid feature, so to say, none of the other changes pointing either to that or any other particular direction. My impression is that the changes finally result in sterilisation, and that the plant, if left alone, will never recover its normal

state—but I cannot speak with certainty on this point. My experience is that the Bardfield Oxlip does not readily seed itself, but my firm belief is that its pollen readily fertilises the Primrose, and occasionally y, but not often, the Cowslip. It, in common with the others, is visited by many sorts of insects." Mr. French sent a great variety of blossoms of Primroses with white and pink corollas, as well as foliaceous and other modifications; of these he observes, "The enclosed flowers are from Primroses which have seeded in a natural way in my garden, but the changes have not been developed until the second or third year has passed. My contention is that the changes are due in part to cultivation, but very much more to disturbances initiated by the application of pollen from other plants, and more particularly from the stamens of the Bardfield Oxlip, in the company of which they have been grown. It may be of interest to say that I live on the limiting line of the two species, the Oxlip and Primrose, and can easily point out the most northerly Primroses and also the most southern Oxlips, and at one place there is not a mile between the two; but the line is absolute, and neither plant intrudes into the other's domain." Dr. Masters observed that the only change the Bardfield Oxlip undergoes in his garden is to sometimes assume a pink colour.

*Wellingtonia, ♀ Flowers.*—Dr. Masters exhibited shoots of the Sequoia gigantea with terminal young cones in the flowering state. They are scarcely quarter of an inch in length, and therefore easily overlooked, but being more globular in form, when once seen they can be readily distinguished from the leafy apices of other shoots.

*Sirex gigas in Timber.*—He also showed a specimen of the "Hornet Saw Fly" from Dropmore. It is rather larger, but somewhat closely resembles a hornet in appearance. The grub bores through timber. Mr. McLachlan observed that it was formerly much more abundant, having been introduced from North Europe.

*Niphotos Rose, Malformed.*—Dr. Masters also exhibited good examples of a foliaceous calyx in this Rose, the sepals being converted into large pinnate leaves.

*Tyloses in Beech Root.*—Dr. Masters exhibited a microscopic slide from Mr. Forbes, showing the cellular growth in the vessels known by this name. To such an extent had it occurred that the wood showed a dark brown streak, indicating the position of the vessels containing the tyloses.

*Mignonette, Origin of.*—Mr. Henslow suggested, from a comparison between Reseda odorata and R. Phytouna, a common species in South France and Algeria, that this latter was the source of the garden plant. In the original description in *Bot. Mag.*, A. D. 1790, it is said to be Egyptian, but the garden Mignonette is not in the Egyptian nor in North African Floras, and does not appear to be known wild. The differences between this and R. Phytouna, as Mr. Douglas observed, are not greater than between varieties of R. odorata. The wild species, it is true, has not the scent; still, as Mr. Henslow observed, when a bunch of the flowers are taken, there is just a faint odour suggestive of the Mignonette.

*Cutha palustris, Honey Glands of.*—Mr. Cuthbertson called attention last year to the apparent absence of these structures, described by Muller, on the sides of the carpels, in his *Fertilisation of Plants*, for that author spoke of a "fold" on the sides of the carpels, with a gland in the fold. This has not been seen in any English plant, but there is a spot where the epidermal tissue is papillary, suggestive of an abortive gland. Mr. Cuthbertson forwarded specimens received from Germany, but still nothing was present in agreement with Muller's description.

### NATIONAL AURICULA.

#### Northern Section.

APRIL 25. — The annual exhibition under the auspices of this Society, was held in the Royal Botanic Gardens, Manchester, on the above date. It was more than usually attractive show, because of the good quality of the flowers, and the show house with its wealth of plants, gave a setting and surrounding that greatly enhanced the effect of the collections of Auriculas and Polyanthus.

For six dissimilar Auriculas, Alpines included, Mr. T. Lobb, Todmorden, was 1st with George Rudd, Smiling Beauty, F. D. Horner, John Simons, George Lightbody (a variety that still holds front rank), and Mrs. A. Peris; 2nd, Rev. F. D. HORSER, Lowells, Burton-in-Lonsdale, with Shirley Hibberd, Miriam, Eyebright, Eurydice (fine deep violet with white centre), Favourite and Dreadnought; 3rd, Mr. M. MIDDLEBY, Halifax, with Rachel, George Lightbody, Trail's Beauty, F. D. Horner, Mrs. Potts, and Mrs. Dibdin; 4th, B. SIMONITE, Esq., Sheffield, with Flamingo, Richard Easton, Amy Roberts, Dinham, Cleopatra, and a good seedling. Messrs. J. W. BENTLEY, Staleyhill; J. CLEMENS and J. STOKER of Birmingham, also exhibited in this class.

For dissimilar, one at least in each of the classes, alpines excluded.—1st, Rev. F. D. HORSER, with Rainlow, Maggie, George Lightbody, and Favourite; 2nd, Mr. Lobb, with Acne, G. Lightbody, F. D. Horner, and Mrs. Potts; 3rd, Mr. MIDDLEBY, who had Mrs. Dodwell, good; 4th, M. SIMONITE; 5th, Mr. BUCKIS, Staleybridge.

For two dissimilar, there was a large competition, Miss WOODHEAD, Halifax, being 1st, with George Rudd and Mrs. Potts; Mr. R. GIBSON, Eccles, 2nd, with Heat or Bell and J. S. Hannaford; Mr. A. R. BROWN, Birmingham, was 3rd; Messrs. J. WOOD, T. BUCKLEY, and T. STRELFOR all of Staleybridge, following in the order they are named.

NEW INVENTION.

"CHELTENHAM" GARDEN AND CONSERVATORY SYRINGE.

It is a desideratum to possess a syringe which can be used without having one's clothes and shoes wetted during the operation of syringing plants. The Cheltenham syringe is one which we can recommend to amateurs, ladies, and others for cleaning plants indoors and out from aphids. It is light and handy, is made of brass, possesses an appliance in the form of a globe of brass 6 inches in diameter, which ensures a continuous stream of water to issue from the nozzle or rose, and being furnished besides with a short piece of india-rubber tubing as a suction pipe. The water or insecticide can be used direct from a cistern, tub, or bucket, without the necessity to dip and recharge, as is the case with ordinary syringes. It is apparently an adaptation of the principles of the more powerful garden-engine sometimes seen mounted on a wheel-trace, and used for washing Peach and other fruit-trees, and in leafy conservatories, Palm-houses, &c.

A NEW METHOD OF STOPPING PRESERVE-BOTTLES AND JARS.

A method of stopping preserve-bottles and jars, which shall be simple, cheap, and of easy application,

FIG. 89.—A NEW METHOD OF STOPPING PRESERVE-BOTTLES.

has long been wanted; and the French Flint-glass Bottle Company, whose premises are at 6 and 7, Long Lane, Aldersgate Street, E.C., seem to have hit upon a very secure and simple device. The upper diagram in fig. 89 shows the neck of a jar or bottle, with its tinned steel cap in position, held firmly, yet allowing for the escape of steam, by a simple clip of steel, during the process of boiling, in the case of whole fruit. The lower diagram gives a transverse section of the same; A, the clip to be removed when the contents cool; B, a thin ring of india-rubber; C, the cap of metal. During the process of cooling a vacuum is created in the bottle, consequently the pressure of the outer air suffices to close the cap and hold it tightly till an aperture be made with a fine brad-awl. The caps will serve for many years, if before making use of them the awl-holes are closed with solder. For further particulars we refer our readers to the Royal Horticultural Society's report, p. 530 in our last issue.

CONDITIONS AFFECTING THE QUANTITY OF STARCH IN POTATOS.

THE following is an abstract of a valuable paper by E. S. Goff, the Horticultural Professor at the Agricultural Station, University of Wisconsin. The chief food-value of the Potato is in its starch-content, and analyses show that this may vary under different conditions from less than 8 per cent. to more than 29 per cent. Such being the fact, a study of the conditions that affect starch-content is certainly in order. This subject has received more or less of the author's attention since the year 1889, and a summary of this investigation is here presented.

Since by far the greater part of Potato tubers consists of starch and water, and since starch is heavier than water, it is evident that a variation in starch-content will affect the specific gravity of the tuber. This gives us a convenient means of determining approximately the starch-content of Potatos, and this method has been used in this investigation.

VARIATION OF STARCH-CONTENT IN DIFFERENT VARIETIES.

Forty-six varieties were tested (of the crop of 1889), of which the average starch-content was 16.2 per cent. The variety showing the highest amount was the Zenith, which contained 22.9 per cent.; the one showing the lowest starch was the Rural Blush, which contained only 13.1 per cent. Thirty-one varieties, mostly different from the above, were tested in 1890, of which the average starch-content was 14.3 per cent. The variety showing the highest starch was the Burbank, which contained 17.7 per cent.; the one showing the lowest was a "kidney" Potato from Germany, which contained but 11.4 per cent. All of these Potatos were grown on a light clay loam, in a good state of fertility, and the cultural conditions for all the varieties grown in each season were practically identical. It thus appears that the starch-content of different varieties of the Potato, grown under as nearly as possible similar conditions, may vary as much as 9.8 per cent.

VARIATION IN STARCH-CONTENT BETWEEN DIFFERENT SPECIMENS OF THE SAME VARIETY.

If we place a number of tubers of a given variety of Potato in a vessel of water, and gradually stir in common salt, it will appear that some of the tubers will be floated by the solution before others, thereby indicating a lower specific gravity, and consequently a lower starch-content. Tubers are readily separated in this way into two or more grades; and the difference in the cooking quality of the heavier and lighter specimens is often very striking. This method of assorting Potatos is to be commended to those who desire to secure extra fine samples for the table.

The interesting question arises as to the cause or causes for this difference in starch content between tubers of the same variety in the same season. Certain apparent causes have appeared in the course of this investigation, and are here noted.

PRONGED TUBERS ARE POORER IN STARCH THAN REGULAR ONES.

This fact was brought out in several different tests. In 1889, pronged and regular tubers of four varieties were tested separately with the following results:—

Table showing the relative starch content of pronged and regular tubers.

Variety.	Starch Content.	
	Regular Tubers.	Pronged Tubers.
	Per cent.	Per cent.
Imperial Irish Cup ... ..	15.4	14.1
Rural New Yorker, No. 2 ... ..	17.9	15.1
Seneca Red Jacket ... ..	16.6	13.1
Zenith ... ..	18.2	15.1

It appears, therefore, that the development of prongs on certain tubers is one cause of the variation in

For two dissimilar ("maiden" growers only), Mr. A. R. Brown, Birmingham; Mr. R. KESHAW, Ashton-under-Lyne; and Mr. WM SHIPMAN, Altrincham, were so placed. Geo. Lightbody and F. D. Horner were the best sorts.

For single plants, green edges, Mr. HORNER was 1st with Dream; Mr. LORD 2nd with F. D. Horner; and Mr. SIMONIE was 3rd and 4th.

For single plants, grey edges, Mr. LORD took 1st position with E. Lightbody; Mr. MIDGELEY, Mr. HORNER, and Miss WOODHEAD following in the order named.

For single plants, white edges, Mr. LORD, Mr. MIDGELEY, and Mr. GIRTON, were best; and for Sells, Mr. LORD, Mr. BENTLEY, and Mr. SIMONIE.

For the premier Auricula in the show, Mr. LORD had the best on his stand of six—George Lightbody.

ALPINE VARIETIES.

For six dissimilar, Mr. JOHN BESWICK, Middleton, was 1st, with John Allen, John Ashton, Richard Girtton, Forest Queen, Dr. Knott, and F. D. Horner; Mr. R. GIRTON, Eccles, was 2nd, with a collection mostly of seedlings; Mr. J. STOKES, Birmingham, was 3rd; and Mr. CLEMENTS, Bury, 4th; Mr. T. LEES, Middleton, 5th; and Mr. J. WOOD, Staleybridge, 6th. For four dissimilar, Mr. BESWICK was again to the front; Mr. BENTLEY, Stakehill; Mr. GIRTON, Eccles; and Mr. BUCKLEY, Staleybridge, following. In Mr. BESWICK'S stand was Bright Eyes, awarded the prize as Premier alpine. It is a beautiful bronze shaded flower with yellow centre.

For two dissimilar, Mr. T. STELFON, Staleybridge, was 1st, with Dr. Knott and Forest Queen; and Mr. LORD, 2nd. For single plants, white centres, the unnamed seedlings of Messrs. GIRTON and BESWICK were best; and for yellow centres, GIRTON was 1st with Bright Eyes; STOKES, 2nd, with John Allen. Messrs. BESWICK and STELFON following, the latter exhibitor having the best Dr. Darnford shown.

POLYANTHUS.

For the three best black-grounds, Mr. BESWICK was 1st with Exile, Favourite, and Mrs. Brownhill; and Mr. THORNLEY, Middleton, was 2nd. For three dissimilar red-grounds, Mr. THORNLEY was 1st with Sydney Smith, George IV., and Middleton Favourite; and Mr. BESWICK was 2nd. For single plants, Messrs. BESWICK and THORNLEY distanced all other competitors. Misses HOPKINS, Mers Cottage, Knutsford, had a finely-grown assortment of border Polyanthuses and Primroses; they were in splendid condition, the weather recently having been favourable to these flowers. Hoop-in-Hoop, Jack in the Green Primroses make grand border flowers. A First-class Certificate was awarded to a double Primrose named Peter, a flower of a good size, and having finely-marbled segments, with bright orange centre. The plant is robust, and will be useful in the herbaceous border.

MISCELLANEOUS.

Mr. HENRY BROWNHILL, Sale, was awarded a Silver Medal for a very finely-grown, nicely-arranged collection, in which Primula Sieboldi, in various colours, was prominent; these, with lots of Clematis, dwarf-grown, with flowers of varied colours nestling in the foliage, attracted much notice. The Snowflake Pink is pure and free, and the lot of Spiraea and Mollis Azaleas, combined with fine stands of Tea Roses, made a charming coup d'œil.

DICKSONS, Chester, put up a fine stand of cut flowers of Daffodils and other border plants, including Anemone fulgens, brilliant and bright; Primula Sieboldi, and Fritillaria meleagris. Mr. RICHARD VERNON, Northwich, had well-grown fancy Pansies.

DARLINGTON HORTICULTURAL.

APRIL 27.—The Jubilee Show of this society, held in the Central Hall on the above date, was a distinct success. Never before has there been a better collection of plants or of cut flowers, and the attendance of visitors was extremely satisfactory.

Several honorary collections of beautiful Palms, Azaleas, and other plants were exhibited by Sir THEODORE FRAY, Alderman ARTHUR PEASE, Mrs. GURVEY PEASE, and Mr. E. B. MOUNSEY. These, together with the competitive exhibits, were arranged with taste by Mr. J. McINTYRE, and the visitors on entering were confronted by a pleasing display of colour.

The larger plants were disposed on and surrounding the platform, and on staging running down the centre of the room. The most imposing feature of the show were the groups of miscellaneous plants arranged for effect.

Mr. C. J. BACKHOUSE, of Wolsingham, sent a beautiful collection of forty varieties of Narcissi, including a couple of magnificent blooms of Weardale Perfection. Similar collections were exhibited by Mr. E. B. MOUNSEY, of Blackwell and Mr. T. S. WARE, Tottenham, London.

Of the plants in pots, Hyacinths were the best, and generally they were much superior to those shown in previous years. Narcissi, too, made a very fine show.

The table decorations on the whole showed a marked advance, but individually none were so effective as the 1st prize exhibit of Mrs. BECKWITH at last year's exhibition.

In the amateurs' and cottagers' classes the exhibits were very meritorious, and in every department the judges had unusual difficulty in making the awards.

starch content, and that this pronging considerably lessens the amount of starch, and, consequently, deteriorates the cooking qualities.

**INFLUENCE OF THE DEPTH AT WHICH THE TUBERS GROW IN THE SOIL UPON THE STARCH CONTENT.**

The question arose, if a cause for the variation in starch content in tubers of the same variety may not be found in the different depth at which the tubers grow in the soil? An investigation in this line was commenced in the autumn of 1892, which has yielded some interesting results. In six different varieties of Potato, the surface-soil was carefully removed from several plants, and the tubers first found were placed in one sack, after which those lying deeper in the soil were placed in another. In one of the six varieties three classes were made with reference to depth. The result showed that in every case the specific gravity was the highest from the deeper-growing tubers, and where three grades were made, the specific gravity of the intermediate grade ranged between the other two. When we consider the slight variation in depth at which the tubers grow in the soil, these facts are significant.

The trial was repeated in 1893, and the results lie in the same direction, which facts suggest a possible explanation of the depth influence, viz., that it acts through the temperature of the soil. The deeper tubers are in a cooler medium than the shallower ones, and soil that is killed is warmer in hot, dry weather than that which is not killed.

**SUMMARY OF THE RESULTS.**

A summary of the whole investigation shows that:—1. Different varieties of the Potato, grown under the same cultural conditions, may vary in their food value to the extent of one-half or more. 2. The starch content of the same variety, and on the same soil, may vary considerably in different seasons. 3. Different tubers of the same variety, grown under similar cultural conditions, may vary in their starch content to the extent of one-third or more. 4. This difference does not appear to be a result of heredity. 5. Pronged tubers are inferior in their starch content to regular ones. 6. The tubers that grow deepest in the soil are richest in starch. 7. In one trial, the hilling of Potatoes apparently caused a reduction in their starch content. 8. Potatoes grown rather closely in drills were richer in starch than those grown in rows both ways. 9. Potatoes greened by exposure to sunlight, and those that are very scabby, are not necessarily poorer in starch than others. 10. The higher the starch content, the sooner a Potato cooks, and the more it swells in cooking. 11. The flavour of the Potato is not necessarily dependent upon its starch content. The market value of Potatoes should, in equity, be based upon their starch content, rather than upon their bulk, and this subject is commended to the attention of Potato dealers. There is no good reason why a lot of Potatoes that average but 12 per cent. of starch, should sell for as much per bushel as another lot that average 20 per cent., for the latter are worth much more for food than the former, while being more desirable in every way. *J. J. Willis, Harpenden, Herts.*

because it is only in well-sheltered positions that it does not get injured by frost. The following species is, however, quite hardy in Germany, and therefore it is this species that is chiefly planted.

*Forsythia suspensa* is a more variable shrub, and for that reason it is known under different names at several times; firstly under the name *F. suspensa* it was brought by Verkerk Pistorius, from Japan to Holland; then it was brought from China by R. Fortune, and named by Lindley *F. Fortunei*; and lastly, it was brought from Japan as *F. Sieboldi*. The first and the last named of these *Forsythias* are exactly the same, but *F. Fortunei* differs by its more robust growth, and some other little characters. The correct nomenclature and the differences are the following:—

*Forsythia suspensa*, Vahl. (Sieb. and Zucc.)  
*a. Fortunei*, Rehder, *Gartenfl.*, 1891, p. 398; *F. Fortunei*, Lindl., *Gard. Chron.*, 1867, p. 412.—Shrub of robust growth, with almost erect branches, only on older plants pendulous. Leaves undivided, trifid or trifoliate, ovate or oblong-ovate, rounded or somewhat attenuate at the base, acute-serrulate. Flowers on short peduncles, 1–3 in an axil. Calyx as long or longer than the tube of the corolla.

*b. Sieboldi*, Zabel, *Gartenfl.*, 1885, p. 36 (*Syringa suspensa*, Thbg.; *F. suspensa*, Vahl.; *F. Sieboldi*, Dippel, *Handb. d. Laubholz.*, i., p. 109). Shrub, with slender pendulous branches. Leaves mostly undivided, roundish-ovate or ovate, rounded at the base, serrulate, or crenate-serrulate. Flowers generally single in an axil, pendulous on  $\frac{1}{2}$ – $\frac{3}{4}$ -inch long peduncles. Calyx mostly shorter than the tube of the corolla. Corolla generally darker yellow, with more striking orange stripes inside, and the segments larger and shorter than in the preceding variety.

The above-named differences, however, are not perfectly constant, as there are transitions between the two varieties. Of the variety *Sieboldi*, I have seen dried specimens of cultivated plants only, which were collected in Japanese gardens; those in China in the wild state, collected plants, I have seen, belonged to the variety *Fortunei*; therefore, and for some other reasons, I believe that *F. suspensa*, Fortune is the typical form; *F. suspensa* Sieboldi, however, is a form produced in Japanese gardens by selecting the cuttings from pendulous branches of the typical form.

The difference in the length of the style was taken as a distinguishing feature in *Forsythia*, by Prof. Dippel. This is, however, only an individual difference, because the genus is a hetero-styled one like *Primula*, *Lytbrum*, and others. So far, I know only the macro-styled form of *F. viridissima*, having the style longer than the stamens, is cultivated; and as dried specimens only collected in China, I saw the micro-styled variety, having the style shorter than the stamens. The generally cultivated form of *F. suspensa* is micro-style, but the macro-styled form exists in the gardens at Kew. Of *F. intermedia*, both forms are cultivated. More detailed information can be found in my paper, "Ueber Dimorphismus bei *Forsythia*," in *Gartenflora*, 1891, pp. 395–400. *A. Rehder, Erfurt.*

**ENQUIRIES.**

"He that questioneth much shall learn much."—BACON.

CAN you inform me if there exists a society in London which enrolls members with or without a fee for the purpose of prosecuting practical botanical investigations in or about London? I mean, one that undertakes excursions with a view to receive lessons from a lecturer on any specimens, &c., which are found in the wayside. *An Enquirer.*

Is the plant commonly known as "Skirret" producing small, fleshy tubers still cultivated in this country? It is said to have been introduced from China as long ago as 1548. The eatable roots are described by an old writer as "the sweetest, whitest and most pleasing of roots." *D. M.*

**MARKETS.**

**COVENT GARDEN, APRIL 30.**

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply to the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. En.]

**FORSYTHIA SUSPENSIA.**

*FORSYTHIA suspensa*, one of our most beautiful early-flowering shrubs, is found in the garden under different names, being considered by some people as synonymous, by others as distinct species, but there are really two species of *Forsythia*, viz., *F. viridissima* and *F. suspensa*, and besides, a cross between both, *F. intermedia*, raised from seeds of *F. suspensa*, by Mr. Zabel, in Munden (Hanover), and described in the *Gartenflora*, 1885, p. 36. *Forsythia viridissima*, Lindl., is a shrub of nearly the same beauty as *F. suspensa*, but of erect growth, of which no varieties are known, except a form with variegated leaves; *F. viridissima* is not so hardy as *F. suspensa*, and in Germany it is seldom to be seen freely flowering,

SEEDS.

LONDON: April 29.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, although as might be expected, the sowing demand for field seeds is now beginning to fall off, the interesting speculative inquiry for holding over, which recently set in, is daily gaining both in strength and volume. Notwithstanding, however, this welcome rally in values all along the line, excellent French red Clover-seed is to-day obtainable at 3s. per cwt. White Trefoil and Alsiko, and also Perennial and Italian Rye-grasses are winding up the season at exceedingly low rates. For Tares the sale is slow. Canary-seed and Hemp seed meet with more attention, and the tendency of values is upwards. Rape-seed keeps strong, mustard is neglected. Peas and Haricots are featureless.

FRUIT AND VEGETABLES.

BOSCHON: April 28.—Quotations:—Onions, 4s. to 5s. per bag; new Carrots, 9d. to 1s., and Turnips, 8d. to 9d. per bunch; Cabbages, 2s. to 2s. 9d. per tally; Horseradish, 8s. to 12s. per dozen rolls; Apples, 4s. to 6s. per bushel.

SPITALFIELDS: April 28.—Quotations:—Cauliflowers, 4s. to 6s. per tally; Cabbage, tied, 2s. to 3s. per tally; do, open, 4s. to 6s. do.; Broccoli, 9d. to 1s. per bag; Greens, bag, 1s. 6d. to 2s. 3d.; Rhubarb, forced, 9d. to 1s. 3d. per dozen bundles; natural, do., 2s. to 2s. do.; Turnips, bunch, 3s. 6d. to 4s. per dozen; do., bag, 1s. 3d. to 2s. 3d. per bag; Onions, Egyptian, 6s. to 7s. do.; do., Spring, 1s. to 1s. 3d. per dozen bunches; Mint, 2s. to 3s. do.; Parsley, 1s. to 1s. 3d. do.

STRATFORD: April 29.—Quotations:—Cabbages, 2s. to 3s. 6d. per tally; Greens, 1s. 9d. to 2s. per dozen; Cauliflowers, 1s. 3s. to 1s. 6d. per dozen; do., s. to 7s. per tally; Broccoli, 3d. to 4d. per dozen; Horseradish, 1s. to 1s. 3d. per bundle; Parsley, 1s. per dozen bundles; Rhubarb, forced, 1s. to 1s. 3d. do.; do., field, 1s. 6d. to 2s. do.; White Turnips, 2s. to 2s. 6d. do.; Leeks, 1s. 4d. to 2s. do.; spring Onions, 1s. to 1s. 6d. do.; Salad, 1s. 6d. per dozen punnets; frame Cucumbers, 2s. to 3s. 3d. per dozen; Carrots, household, 2s. to 2s. 6d. per ton; cattle feeding, 22s. to 24s. do.; Parsnips, 20s. to 25s. per ton; Mangels, 12s. to 18s. per ton; Onions, Egyptian, 6s. to 6s. 6d. per cwt.; Apples, Tasmanian, 9s. 6d. to 10s. 6d. per case; do., Nova Scotian, 18s. to 20s. per barrel.

FARRINGTON: April 30.—Quotations:—Cauliflowers, 1s. 3d. to 1s. 6d. per dozen; Cabbages, 9d. per bunch; Leeks, 1s. per dozen; Beet, 9d. per dozen; Carrots, 2s. per ton; Turnips 2s. per dozen bunches; Parsnips, 1s. 6d. per bag; Rhubarb, outdoor, 2s. per dozen bundles; Seakale, 1s. 6d. per punnet; Broccoli, 6d. per bushel; Tomatos, 1s. 3d. per tray; Mushrooms, 5s. per 10 lb.; Apples, Tasmanian, 10s. to 14s. per box.

POTATOS.

BOROUGH: April 28.—Quotations, Old Potatos ranged from 30s. to 8s. per ton; and New sold at from 12s. to 20s. per cwt.

SPITALFIELDS: April 28.—Quotations:—Magnums, 30s. to 50s.; Sutton's Abundance, 45s. to 65s.; Reading Giants, 50s. to 65s.; Scotch Magnums, 50s. to 60s.; Dunbar do., 60s. to 70s.; do. Regents, 50s. to 60s. per ton.

STRATFORD: April 28.—Quotations:—Dark soil, Bruces, 20s. to 25s.; light do., 28s. to 50s.; Reading Giants, 25s. to 40s.; Sutton's Abundance, 40s. to 50s.; Scotch Main Crop, 40s. to 50s.; Dunbar, 40s. to 50s.; Scotch Main Dunbars, 40s. to 50s. per ton.

FARRINGTON: April 30.—Quotations:—Best Main Crop, 70s. to 80s.; Druids, 55s. to 65s.; Bruces, 40s. to 45s.; Magnums, 30s. to 40s.; Imperators, 20s. to 30s. per ton; New Jersey, 22s. 6d.; Canary, 12s.; Egyptian, 10s. per cwt.

LONDON MARKET AVERAGES: April 29.—New: Jersey, £22 to £25, and Guernsey, £22 to £25; Lisbon, £10 to £11; Maltese, £10 to £12 per ton. Old: Dunbar Main Crop, 60s. to 90s.; do. Bruce, 50s. to 70s.; Sutton's Abundance, 45s. to 55s.; Main Crop, 40s. to 50s. per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr) for the week ending April 25, and for the corresponding period last year:—1896: Wheat, 25s. 6d.; Barley, 21s.; Oats, 13s. 11d. 1895: Wheat, 20s. 9d.; Barley, 20s. 8d.; and Oats, 14s. 2d.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Hay, best, 65s. to 87s. 6d.; inferior, 88s. to 60s.; Clover, prime, 60s. to 85s.; inferior, 30s. to 35s.; mixture, 60s. to 84s.; and straw, 24s. to 40s. per load.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.
- Principal Grassing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; \*Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending April 25, is furnished from the Meteorological Office:—

"The weather was fair and dry during the greater part of the week, the only rain experienced being some showers over our eastern districts on the 22nd or 23rd, and slight falls in most parts of the kingdom towards the end of the period.

"The temperature was above the mean in all districts, the excess ranging from 1° in 'England, E. and S.' to 4° in 'Scotland, N. and W.', 'Ireland, N.', and 'England, N.E.' and to 6° in 'Scotland, E.' The highest of the maxima were recorded during the earlier or middle part of the week, and varied from 60° in 'Scotland, E.', the 'Midland Counties,' and 'Ireland, N.' to 63° in 'Scotland, W.' and 62° in the 'Channel Islands.' The absolute minima were rather low for the time of year, ranging from 28° in 'Scotland, E.', 'England, E.' and the 'Midland Counties,' to 36° in 'England, N.E.' and 38° in the 'Channel Islands.' The diurnal range of temperature was large over all the more inland parts of the kingdom.

"The rainfall was extremely slight, and much less than the mean in all districts.

"The bright sunshine was deficient in 'Scotland, N. and W.', but was fairly abundant, and exceeded the mean, in all other districts. The percentage of the possible duration ranged from 58 in the 'Channel Islands,' 52 in 'England, S.W.', and 50 in 'England, E.', to 33 in 'Scotland, W.', and to 22 in 'Scotland, N.'"

ADDRESS: Barbier Frères et Fils, successors to Trauson Frères, 16, Route d'Olivet, Orleans, France.

ADLUMIA CIRROSA: H. H. This is generally considered a biennial. Doubtless it might under certain circumstances flower the first year.

ASTERS: *Oxonium*. See p. 556.

BOOKS: A. R. S. Enquire at the Bazaar Office, 170, Strand, W.C.

ERRATA.—P. 463, col. c, line 12, for "Yews" read "first." In p. 520, col. a and c, for "Ashcroft" read "Ashworth," as at p. 518, col. b.

FREESIA: Messrs. Dammann & Co. send a complex flower of a Freesia, the abnormality arising merely from the union of two or three flowers into one.

MUSHROOMS: A. Z. It is a specimen of the ordinary Mushroom, but very large and rather coarse. We cannot account for the great elongation of the stem. Can you furnish particulars of culture, depth of covering on the bed, degree of warmth of the bed, and of the house.—F. H. They are attacked by a parasitic fungus. It will be prudent not to eat them.

NAMES OF PLANTS: Y. H. M. The common Almond.—C. Webb. *Pulmonaria officinalis*.—P. F. Kerra japonica.—F. P. *Ceanothus azureus*.—H. H. 1, *Euphrasia officinalis*; 2, *Polygonum persicaria*; 3, *Geraonium Robertianum*; 4, *Prunus insititia*, probably; 5, *Prunus spinosa*; 6, *Equisetum arvense*.—A. C. 1, *Kerria japonica*; 2, *Galium Aparine*; 3, *Anthriscus vulgaris*; 4, *Erysimum Alliaria*; 5, *Stellaria Holostea*; 6, *Ranunculus Ficaria*; 7, *Glechoma hederacea*.—H. H. C. *Staphylea pinnata*.—A. B. S. *Acidium Viola*.—R. C. *Prunus Padus*, Bird Cherry.—C. P. *Orehis maculata*.—W. & S. *Anemone fulgens*.—H. T. *Amygdalus nana*.—*Alpaca*. 1, 2, *Saxifraga*, next week; 3, *Berberis empetrifolia*; 4, *Iberis coriifolia*; 5, *Saxifraga (Megasen) cordifolia*; 6, *Juniperus communis*.—Miss C. *Ribes aureum*.—T. F. 1, *Linum trigynum*; 2, *Anthericum lineare variegatum*; 3, *Kerria japonica*; 4, *Franseria calycina*; 5, *Agathia celestis*.—G. M. A. 1, *Goldfussia isophylla*; 4, *Melianthus major*.—Blackmore. *Dendrobium superbum*, often called *D. macrophyllum*; D. albo-sanguineum, the buff-coloured flower; *T. Coomber*. The finest variety of *Cypripedium Lawrenceanum* we have seen.—R. H. The true *Cypripedium villosum aureum*; superior to what is usually seen in gardens under that name. G. W. C. 1, *Bletia hyacinthina*; 2, B. h. *Gebina*; both are natives of China and Japan, and are excellent greenhouse plants, and even hardy in certain situations. B. Shepherdi is even a finer thing, with larger violet-purple flowers, but being a native of the West Indies, it is not so hardy. The other is a very fine form of *Odontoglossum luteo-purpureum*.—M. H. H. 1, *Celsia cretica*; 2, *Trachelospermum jasminoides*; 3, *Amelanchier canadensis*.—F. E. B. 1, one of the varieties of *Acer platanoides*; 2, one of the varieties of *Acer pseudoplatanus*; 3, *Pyrus Aria*; 4, *Berberis empetrifolia*; 5, *Pyrus japonica*.—H. S. *Physalis Alkekengi*, Bladder Cherry.—*East Lothian Gardener*. 1, *Bryonia dioica*; 2, *Polygonatum officinale*; 4, *Gentiana acaulis*; 5, *Sparmannia africana*; 6, *Polygonum arvense*.—G. C. *Ochertype*. *Scilla verna*. Is it wild in your neighbourhood?—J. B. *Morrea fimbriata*, an Iris.—N. C. *Kerria japonica*.—R. S. *Rhododendron formosum*, alias Gibsonia.

NETS FOR SUPPORTING MELONS: A. D. B. The materials for making the nets, if not the nets themselves, could be obtained of the horticultural sundriesmen.

NITRATE OF SODA FOR TOMATOS: A. D. B. Nitrogenous manures, such as guano, nitrate of soda, or sulphate of ammonia, if added to mineral manures, especially potash and phosphoric acid, greatly add to the produce. See *Gardeners' Chronicle*, March 9, 1895, p. 306.

ODONTOGLOSSUM PISCATORUM: J. B. We are not able to inform you why the flowers have all come deformed. It looks as if some sudden check to growth had occurred.

ORCHID DISEASE: A Constant Reader. The Orchid disease is *Uredo Lynchii*. As you observe, it is useless to clean off the leaves, because the disease is endophytal. Cutting off the diseased leaves at once when the "rust" appears might prevent its spreading, but a radical cure is doubtful. Syringing with Condy's Fluid has been recommended, and has been of service in parallel cases. The diseased plants should be isolated from all other Orchids, or the disease will spread. M. C. C.

PANSIES: C. H. We do not see anything special in your seedlings. There are many better.

PEAR LEAVES: H. M. The Pear-leaves are affected with the old trouble, which attacks them all the

world over, wherever the Pear and Apple are cultivated. It is the same fungus (*Fusicladium dendriticum*) which causes the Apple and Pear-scab on the fruits (see *Gardeners' Chronicle*, November 28, 1885). Tho only check yet known is to syringe with one of the copper solutions—either Bordeaux Mixture or Eau Celeste. *M. C. C.*

**POPPY MOULD:** *Rev. G. Holley Dod.* Your mould on *Meconopsis* is the same as that which attacks the Opium Poppy and other Poppies, and is called *Peronospora arborescens*. It has a close relationship to the Potato disease and American Vine disease. It is an endophytl parasite, so that external spraying can do little good. To prevent its spreading, the only chance is to root up and burn all affected plants. See Berkeley in *Journal of the Horticultural Society*, vol. i., p. 31, pl. 4, fig. 24. *M. C. C.*

**PRIMULA AND POLYANTHUS:** *Primrose.* The Primula has one flower on each stalk which comes direct from the root, and the latter blooms in trusses of many flowers. There are numerous crosses between the two, which combine the characteristics of each, more floriferous, perhaps, than either, with great variety of colours, and less prim or stiff in habit than the Polyanthus proper.

**RICHARDIA:** *C. B.* It is not at all uncommon to see a double spathe; the pity is our gardeners do not try to "fix" so desirable a sport.

**STOPPING HERBACEOUS CALCEOLARIAS:** *Curious.* Stopping is sometimes practised in so far as to nip out the central or main flower-stem, which has the result of causing many more stems to shoot up than would otherwise do so. The proceeding causes also a somewhat late blooming, rather smaller because more numerous flowers, and dwarfs the plants.

**SWORD BEAN:** *W. A. M.* Probably the seed of *Canavalia glabrata*, climbing Bean, greenhouse culture.

**VINE LEAVES:** *R. Walker.* The Vine leaves and shoots furnish no evidence of fungus disease. The appearance suggests root troubles, or at any rate something culturally wrong, which cannot be determined from the material sent. The cause and remedy must be sought externally. *M. C. C.*

**VINERY TEMPERATURES:** *F. Perry.* The temperatures of the earlier house are sufficiently high by day, but 5° too high by night, unless the varieties are Mscats, black or white. You should moderate the use of artificial heat by day whenever it is safe to do so; and aim at slightly increasing the day warmth week by week to the ripening point of the fruit, but it should be chiefly by sun heat. The late vinery should now be started, or the fruit will not ripen. Observe our weekly Calendar.

**VIOLA:** *A. B. S.* The fungus on Viola is *Æcidium Viola*.

**WATER MELONS:** *A. D. B.* There is no reason why Water Melons should not be grown under glass in this country. They require rather less heat than ordinary Melons. To make sure of a crop, the flowers, as you suggest, might be fertilised artificially.

**COMMUNICATIONS RECEIVED.**—H. B.—J. R.—F. S. & Co.—H. de V.—A. F. M.—C. S. S.—J. F. (next week)—G. C.—H. H. D.—E. G.—M. C. C.—Flowers (next week)—J. M.—Cocker & Son.—D. **CONTINUED INCREASE** in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

**IMPORTANT TO ADVERTISERS.**—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of more than 90 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

**BEESON'S MANURE, SHEFFIELD.**—For Vines, Plants, and Vegetables. Sold with a Guaranteed Analysis. Has stood the test of the principal growers for over 20 years, and is admitted to be the Best for all Horticultural Purposes. In boxes, 1s. and 2s. 6d.; bags, 50 lb., 8s.; 1 cwt., 15s. May be obtained through any Seedsmen; or, direct (bags only), carriage paid, and liberal discount for cash with trial order, from W. H. BEESON, SHEFFIELD. Pure Crushed Bones, all sizes, and other Fertilisers at market prices.

**NATIVE GUANO.**—BEST AND CHEAPEST MANURE FOR GARDEN USE. Price £3 10s. per ton, in bags. Lots under 10 cwt., 4s. per cwt.; 1 cwt. sample bag sent carriage paid to any station in England, on receipt of P. O. for 5s. Extracts from 20th Annual Collection of Reports:—

**NATIVE GUANO FOR POTATOS, VEGETABLES, &c.**  
B. LEE & SON, Market Gardeners, Burnham.—Used for three years for Vegetables, Strawberries, Cucumbers, Tomatos, and other Market Garden Crops, and it has "given great satisfaction for all crops." T. REASON, Gardener to Lord Windsor.—Used for several years for Potatos and general Kitchen Garden Crops. Results: "Good. A capital manure."

**NATIVE GUANO FOR FRUIT, ROSES, TOMATOS, &c.**  
G. STOWARD, Gardener to Sir A. T. Watson, Reigate:—"I have used your Guano for five years, and can bear testimony to its great value for fruit growing." C. ROUSE, Nazeing Park Gardens, Waltham Cross.—Used for Tomatos, Cucumbers, Chrysanthemums, and Roses. Results: "A marked improvement wherever used. A good and cheap manure."  
Orders to the Native Guano Co., Ltd., 29, New Bridge Street, Blackfriars, London, where pamphlets of testimonials, &c., may be obtained. AGENTS WANTED.

### THOMSON'S VINE AND PLANT MANURE.

The very best for all purposes. The result of many years' experience. Largely used both at home and abroad.

Agent for London:—J. GEORGE, 14, Redgrave Road, Putney, S.W.  
Agent for Channel Islands:—J. H. PARSONS, Market Place, Guernsey.  
Sole Makers:—WM. THOMSON AND SONS, LTD., Tweed Vineyard, Clovenfords, N.B.

Price Lists and Testimonials on application. Analysis sent with orders of ½-cwt. and upwards. SOLD BY ALL SEEDSMEN.

### KILL-M-RIGHT

Certain cure for Blight, and all Insect Pests, without injury to plants. Once tried, always used. Sample Tin, 2 lb., free by Post, on receipt of P.O. for 2s. 10d. Price LIST and testimonials on application.

The STOTT FERTILISER & INSECTICIDE CO., BARTON HOUSE, MANCHESTER.

**GISHURST COMPOUND**, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in leather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

**GISHURSTINE** keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade, Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

For destroying Insects on Plants. Used by every Orchid Grower of any note all over the World. The CHEAPEST and BEST. Half-pints 1/4, pints 2/6, quarts 4/6, half gallons 7/6, gallons 12/6, 5-gallon Drums 10/6 per gallon. Carriage Paid. E. G. HUGHES, Victoria Street, MANCHESTER. Sold by all Seedsmen. Pamphlets free on application.

### RICHARDS' NOTED PEAT.

(Trade supplied on best terms). A large stock of the finest quality ORCHID PEAT. Also for Stove and Greenhouse Plants, Ferns, Rhododendrons, &c. By the sack, cubic yard, ton, or truck-load. Can be seen in bulk at London Wharf. Immediate despatch either from London or Grounds. By Rail or Steamer. Prompt and Special Quotations for delivery to any Station or Port. G. H. RICHARDS, Old Shot Tower Wharf, Lambeth, London, S.E.; Peat Grounds and Depôts, Ringwood, Hamworthy, and Wareham. Address all letters to London Wharf.

**THE "LONDON" TOBACCO JUICE.**—Duty free. Will bear diluting with from four to eight parts of water. In Bottles: Pints, 1s.; quarts, 1s. 9d.; half-gallon, 2s. 6d.; gallon, 4s.; or in casks of 10 gallons and upwards at 2s. 6d. per gallon. Sold by all Seedsmen. Sole Makers: CORRY & CO. (Ltd.), LONDON, E.C.

### EPPS'S A1 PEAT

(SELECTED specially for ORCHIDS), Also for Stove & Greenhouse Plants, Hardwood Ferns and Rhododendron do. (Trade supplied). LOAM, SAND, LEAF MOULD, C. N. FIBRE, CHARCOAL, SPHAGNUM MOSS, &c. PEAT sent to all parts of the world at Special Through Rates. Large or small quantities. EPPS & CO., F.R.H.S., Peat Depôt, Ringwood.

### SAVE HALF THE COST.

**GARSDALE'S** BEDFORDSHIRE COARSE AND FINE SILVER SAND

Is admitted by the leading Nurserymen to be the Best Quality obtainable in the Trade. Consumers should Buy Direct from the Owner of these Celebrated and Extensive Pits, which contain a practically inexhaustible supply of Splendid Sand, and thus save half the ordinary cost. Apply direct to the Proprietor for Samples and Price free on Rail or Canal. All Orders executed with the utmost promptness and under personal supervision. Special Railway Rates in force to all parts. All kinds of PEAT supplied at lowest possible prices. Sample Bag sent on application to GEO. GARSIDE, Jun., F.R.H.S., Leighton Buzzard, Beds.

New Potting Material. **JADOO** New Potting Material. FOR SEEDS, CUTTINGS, VINES, &c. 3s. 6d. per bush, 8s. per 3 bu. sack. Illustrated pamphlet, full details, 6d. post free. Obtainable through any Nurseryman, or of JADOO (Lim.), EXETER.

**SPLENDID GARDEN NETTING** 8s. per pad, 200 square yards, any width. Ditto for Lawn Tennis, 12s. Cash with order. "Your garden netting is far superior to that of Messrs. —" Rev. STEPHEN BENNETT, Uffculme. "Splendid quality; best I have had." DAVID BOWEN, Esq., Pembroke.—JOHN ROWE AND CO., Temple Netting Works, Bristol. Please mention paper.

### HILL & SMITH, BRIERLEY HILL, near DUDLEY.

### H. & S.'s BLACK VARNISH, For Iron, Wood, or Stone Outdoor Work.

Forty years' regulation. Ready mixed. Dries in ten minutes with perfect gloss. Is used at Windsor Castle, Kew Gardens, and London and Dublin Parks, and most Landowners. In 18 and 36-gallon Casks only, 1s. 6d. per gallon at works, 1s. 8d. at nearest Railway Station.

REGISTERED TRADE MARK.

GARDENERS AND OTHERS WANTING SITUATIONS.  
26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.  
Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.  
Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.  
N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.  
All Advertisements should be addressed to the PUBLISHER.  
Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

### SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

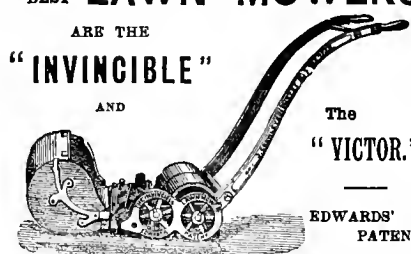

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

# GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH" ROLLING AND COLLECTING MACHINES FOR 1896.

The Winners of every Highest Prize in all cases of competition, and the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world. HER MOST GRAVIOUS MAJESTY THE QUEEN on numerous occasions, HIS ROYAL HIGHNESS THE PRINCE OF WALES, THE KING OF THE BELGIANS.

The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA, And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom. most excellent, as is proved by the fact of some of the Horse Lawn Mowers having been in use here for upwards of thirty years; but combined with good workmanship is the further important recommendation that they are of very light and easy draught.

Upwards of 220,000 of these Machines have been sold since they were first introduced in the year 1858.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

### SINGLE-HANDED SILENS MESSOR LAWN MOWER.

With Improved Steel Chains, Wheels, and Handles.  
To cut 6 in., can be worked by } £1 15 0  
  a Lady                                    } 2 10 0  
To cut 8 in., do. do.                                    } 3 10 0  
To cut 10 in., do. by a strong youth } 4 10 0  
To cut 12 in., do. by a man                            } 5 10 0  
To cut 14 in., do. do.                                    } 6 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

### DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man } £3 10 0  
  on even lawn                                    } 4 10 0  
To cut 18 inches, do. man and boy                            } 7 10 0  
To cut 20 inches, do. do.                                    } 8 0 0  
\* To cut 22 inches, can be worked by two men £3 10 0  
\* To cut 24 inches, do. do.                                    } 9 0 0  
\* If made stronger, suitable for Donkey, 30s. extra.

These Mowers are the "No Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side-delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

We have dispensed with the old-fashioned method of side delivery in these machines, so that they are thoroughly up to date.

### DONKEY AND PONY MACHINES.

To cut 26 inches ... .. £14 0 0  
To cut 28 inches ... .. 16 0 0  
To cut 30 inches ... .. 18 0 0  
Leather Boots for Donkey ... .. 1 0 0  
Leather Boots for Pony ... .. 1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

### HORSE MACHINES.

To cut 30 inches ... .. £22 0 0  
To cut 36 inches ... .. 26 0 0

Grass Box extra ... 5s. 5s. 5s. 6s. 6d. 6s. 6d. 6s. 6d. ..  
If fitted with a Long Handle for cutting banks, &c., 5s. extra.  
No charge for packing cases, except for shipment.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.

N.B.—Those who have Lawn Mowers which need repairing should send them either through their Ironmonger or Seedsman to our Leeds or London Establishment, or direct to us, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

GARDEN SEATS AND CHAIRS, AND HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c. Descriptive Illustrated PRICE LISTS Free on application to

**THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON;** or they can also be had of any respectable Ironmonger, Seedsman, Merchandiser, or Factor in the United Kingdom.

### GREEN'S PATENT Ordinary IRON and WATER-BALLAST ROLLERS

FOR Lawns, Drives, Bowling Greens, Cricket Fields, and Gravel Paths.

PRICES OF	cwt. qr. lb.	Diam.	Length.	Reduced Prices
HANG ROLLERS:	2 1 0	18 in.	by 17 in.	£2 5 0
	3 0 0	20 in.	22 in.	3 0 0
HANG ROLLERS:	5 2 0	24 in.	26 in.	4 5 0
	6 2 0	28 in.	28 in.	5 10 0
	6 2 0	30 in.	32 in.	7 5 0
	6 2 0	30 in.	32 in.	7 5 0

### GREEN'S IMPROVED WATER & SAND BALLAST ROLLERS.

IN TWO PARTS.

They can have the weight regulated to suit the requirements of the ground, and also have it increased up to 45% on the empty weight of the Rollers.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in Great Britain.

PRICES INCLUD-	Weight—cwt. qr. lb.	Diam.	Length.	Reduced Prices
ING WATER	2 1 14	18 in.	by 17 in.	£3 0 0
	3 1 0	20 in.	22 in.	4 0 0
FUNNEL.	5 2 0	24 in.	26 in.	5 5 0
	8 2 0	28 in.	28 in.	7 0 0
	8 2 0	30 in.	33 in.	9 5 0

These Rollers possess many advantages over all others; they are made in two parts, and are free in revolving on the axis, which affords greater facility for turning, and the outer edges are rounded off or turned inwards, so that the unsightly mark left by other Rollers is avoided. They are manufactured of the best materials, bored true in the lathe, turned on the inner edges, fitted on polished shaft, and are got up in a manner surpassing any hitherto brought out.

### GREEN'S IMPROVED PATENT GRASS EDGE CLIPPER. THE "HANDY."

The work it does is clean, neat, and effective, and we have every confidence in recommending this useful "Handy" implement.

It is fitted with long handle, works steadily and with ease.

Price, 30s.

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

**H. CANNELL AND SONS' Nursery Gardens** are always extremely interesting and edifying, just now particularly so. It is said at no other place can all the operations of the various branches of Floriculture and Horticulture be seen carried on so well, certainly not more to the point and to all lovers of high-class gardening who contemplate a day at Swaleley and Eynford, or not, we should be pleased to send Catalogues which are universally acknowledged to be the best issued. Employers would gain considerably by seeding their gardeners at least once during the season.  
SWANLEY, KENT.

**JOHN NATHAN, Covent Garden Market,** is open to RECEIVE CONSIGNMENTS of Strawberries, Peaches, Nectarines, Melon, Grapes, &c. Terms, 5 per Cent. References, London & County Bank, C. G. Branch. Sale accounts daily; cheques weekly. Telegrams: "Nantiar, London."

**NEW FUCHSIAS FOR 1896.**

MR. WILLIAM BULL has the pleasure to announce that he is now sending out for the first time, the following **TWELVE NEW FUCHSIAS**. They are all magnificent varieties, and are offered at a low price for such Sterling Novelties.

- BELLONA**, short tube and completely reflexed sepals of a rosy-carmine colour; large white double corolla, suffused and veined rose-pink.
  - CALLIOPE**, large double flower; corolla rich violet-purple, short tube and broad crimson sepals.
  - CERES**, very short crimson tube and sepals, well reflexed, very full-spreading double corolla, pale bluish, thickly marmorated and veined with deep pink. Very distinct.
  - DORIS**, short tube and large broad coral-red sepals horizontally extended; immense double corolla, petals reddish-purple, margins shaded with metallic blue.
  - FORTUNA**, short tube and broad reflexed crimson-red sepals; large double white corolla, heavily shaded rose, and marked crimson at the base.
  - IRENE**, short red tube and sepals, well reflexed; single reddish-violet corolla marked with crimson at base and well extended.
  - IRIS**, short tube and broad carmine-crimson sepals; large double white corolla, shaded with rose, and flaked rose-pink.
  - LEDA**, short tube and very broad reddish-crimson sepals irregularly reflexed; corolla bluish-violet veined with crimson and much expanded.
  - METIS**, short dark-rose tube and sepals, the latter well reflexed; double white corolla, marked deep rose at base.
  - ROSALIE**, short bright crimson tube and sepals, horizontally extended; large double white corolla, veined at the base with cerise-pink.
  - SERENA**, very short rosy-pink tube, sepals completely reflexed; immense double spreading corolla, bluish-rose, veined with deep pink.
  - THALIA**, short tube and broad coral-crimson sepals, well reflexed; semi-double white corolla, the petals well expanded, suffused with rose, and veined crimson at the base.
- Price 5s. each. The collection of twelve for Two Guineas. **WILLIAM BULL, F.L.S.**, Establishment for New and Rare Plants, 63, King's Road, Chelsea, London, S.W.

SATURDAY, MAY 9, 1896.

THE SALERNIAN SCHOOL OF  
MEDICINE.

“CUR moriatur homo, cui salvia crescit in horto?” is a quotation better known probably than its source, to say nothing of its authorship, which is altogether obscure. Now-a-days such a question (“Why should a man who has Sage in his garden die?”) is unintelligible, but formerly Sage was supposed to possess medicinal virtues of a high order. Indeed, it was called *salvus vite*, and in William Langham's *Garden of Health* (1579), 132 preparations of it are described, and it is recommended as a remedy for about 100 different diseases and ailments, often associated with other things. It was formerly recognised in the *London Pharmacopœia*, and is, I believe, still contained in that of the United States; and Sage-tea still holds a place in domestic medicine in this country. But I intended to write something about the book in which the sentence quoted occurs, as the it is interesting in many ways. It is entitled, *De Conservanda Bonæ Valetudine Opusculum Scholæ Salernitanæ ad Regem Angliæ*. This work is of early origin, and many manuscript copies, or variants, of it are in existence, as well as very numerous printed editions, down to the year 1852. The one before me is one of a number of editions, issues or reprints, edited by Cnrio and Crell; the first of which appeared, according to Meyer (*Geschichte der Botanik*, iii., p. 504), in 1545. In the Kew edition, the preface is so dated, but the printer's (Egenolph, of Frankfurt), date at the end is 1554. The dedication of the work to a King of England has given rise to much discussion as to which king it could have been. Meyer comes to the conclusion that it could have been no other than Robert Duke of Normandy, son of William the Conqueror, and heir to the throne of England, who on his return from the Crusades, stayed at Salerno to have his wounds treated. On hearing of the death of his first brother, it is assumed he proclaimed himself, and was recognised there as King of England.

This little book consists of a series of disconnected, chiefly leonine verses, on diet, remedial medicines, and other things relating to daily life, illustrated by curious, often humorous woodcuts, and connected by longer prose dissertations under the various headings. The first chapter or head is, “De animi pathematis et remediis quibusdam generalibus,” opening with the following lines, which give general directions for the regulation of personal habits, with a view to the preservation of health, and to secure a long life:—

Anglorum Regi scribit schola tota Salerni:  
Si vis incolumem si vis te reddere sanum,  
Curas tolle graves, irasci crede profanum,  
Parce mero, cenato parum, non sit tibi vantium.  
Surgere post epulas, somnum fuge meridianum

Hæc bene si serves, tu longo tempore vives.

This somewhat plain advice is followed by:—  
"Præsens hic liber à doctoribus Scholæ Salernitanæ  
in gratiam Regis Angliæ conscriptus," &c.

Returning to *Salvia*, I may give the quotation in full, just as it is printed, merely stating that the writer is modest enough to avow that there is no remedy against death, but that *Salvia* is a febrifuge, and together with Castor, Lavender, Cowslip, Nasturtium, and Athanas, cure paralysed limbs:—

Cur moriatur homo, cui *Salvia* crescit in horto?  
Contra vim mortis non est medicamen in hortis  
*Salvia* cõfortat nervos, manuuq. tremorem.  
Tollit et eius ope febris acuta fugit.  
*Salvia*, castoreumq. Lavendula, Primula veris.  
Nasturt. Athanas. hæc sanant paralytica membra  
*Salvia* salvatrix nature conciliatrix.

The administration of medicine is set forth under six heads, specifying what, when, and how often medicine should be given, namely:—  
Quale, quid, et quando, quantum, quoties, ubi, dando.  
Ista notare cibo debet medicus bene doctus.  
Ne male conveniens ingrediatur iter.

Sea-sickness is prescribed for in a very simple manner, by the administration of wine mixed with [salt] water previous to setting out—

Nausea non poterit hæc quem vexare marina.  
Undam cum vino mixtam qui sumpserit ante.

The advice with regard to excessive drinking reminds one of the old saying: "take a hair of the dog that bit you," and recommends those who take too much over-night, to begin again in the morning.

Si nocturna tibi nocet potatio vini,  
Hæc matutina rebibas, et erit medicina.

Mustard, we are told: Est modicum grauum, sicum, calidumque; and among other things: "dat lachrymas," i.e., promotes weeping.

It appears, too, that it was used in the form of a dry powder, as there is a representation of a caster similar to a modern earthenware pepper-caster.

The chapters dealing with herbs and vegetables are highly interesting, and the wood-cut figures generally good and sometimes excellent. Among the vegetables we find Cabbage, Onions, Leeks, and Turnips. Most of the cuts are apparently original, but I would not be positive on this point, as I find an elegant one of the common Violet which appeared at an earlier date in Egonolph's *Herbarum Arborum . . . Imagines*. Many other subjects are quaintly illustrated. In the seasons of the year, spring is represented by a social bath—males and females sitting together in a huge tub. Harvesting is the summer industry; vintage the autumn, and drinking the winter. There is a time for all things! The chapter "contra dolorem dentium" (tooth-ache) is illustrated by the various instruments employed in dentistry, and also a lower jaw full of teeth with strings attached to them. *W. Botting Hensley.*

## TREES AND SHRUBS.

### RHODODENDRON (AZALEA) RHOMBICUM.

THE value of this *Rhododendron* consists in its being the earliest of all the deciduous section to flower out-of-doors, and in its distinct and beautiful colour—differing from that of any other species in cultivation. The flowers appear whilst the branches are still bare, and occur as a rule, in pairs; they are 2 inches in diameter, and the colour is a bright rosy-purple, but with more blue in it than is seen in any other *Azalea*. The leaves also differ in shape from those of any other species, being very broad in the centre and narrowing to a point at each end, there-

fore almost purely rhomboidal. They are dull green and hairy on the upper surface, but in autumn turn a fine bronzy-purple. The plant at Kew is of compact bushy form, and is 4 feet high, but specimens of that size are as yet very scarce. The species grows readily enough from seed, but for several years the young plants require careful protection in winter, although the adult plants stand the severest frosts without injury. It was introduced from the Island of Nippon, Japan, where it inhabits the mountain forests. *W. J. B.*

### PINUS MASSONIANA.

The supposed scarcity of this Japanese Pine may be accounted for by its close resemblance in habit and foliage to two better-known species—*P. densiflora* and *P. Pinaster*. From personal observations I am inclined to believe that it is tolerably common in England and Wales; and being a perfectly hardy species, and decidedly ornamental, it is worthy of being largely planted—for special purposes at the least. As seen under cultivation in this country the tree is spreading, although neat in growth, well branched when growing in the open, and the rich pea-green of the needles render it a very distinct and pleasing object. Its leaves are stout, 5 inches long, bluntly pointed, and they are borne two in a sheath, and these are so arranged that the general appearance of the tree is rather light and graceful than massive and dense. The cones are smaller than, but resemble those of, the Scotch Pine, being hardly more than 1 inch long, with a short stout footstalk, and they are produced singly at the tips of the branch, where they cannot be readily seen amidst the long needles. Cones are produced at a comparatively early age, and a specimen under observation here when it was ten years old, at which time its height was 12 feet. Sir Joseph Hooker exhibited at a meeting of the Royal Horticultural Society a branch of *Pinus Massoniana*, bearing a large cluster of cones, but in all probability this was a native-grown specimen, as amongst all the fruit-bearing trees of *P. Massoniana* that I have observed in this country, the cones were produced singly. Probably in old age the cones may be produced in clusters; the trees from which these notes were taken having been planted within the last five-and-twenty years.

The variety *P. M. aurea* is justly recognised as the best of golden variegated Pines, the primrose-yellow colour being sharply defined, and the contrast with the bright green very marked. A great advantage that it possesses over many other variegated Conifers is, that the yellow tint becomes all the more pronounced on trees fully exposed to sunlight. As a specimen tree on a lawn, this variety of *Pinus Massoniana* is of great value. *A. D. Webster.*

## ORCHID NOTES AND GLEANINGS.

### LÆLIA ELEGANS, VAR. KATHLEEN.

AMONG the choice collection of Cattleyas possessed by A. Warburton, Esq., Vine House, Haslingden (Mr. Tom Lofthouse, gardener), is a remarkably well-grown plant of *Lælia elegans*, and of so distinct a character as to be worth a varietal name. The plant has fifty pseudo-bulbs and eight leads, and is in the "pink" of health. It is growing in a 10-inch pot, and is one of the dwarf-growing types of *Lælia elegans*. It is rare, indeed, that one finds a vigorous plant of *L. elegans* of this size. In habit and in flower it comes nearest to *Lælia Stelzneriana*. The sepals and petals are considerably broader than the typical form, and are of the softest peach-colour. The imbricated lobes of the lip are white, slightly flushed, turned back at the extremity, and showing a shaded purple broad margin. The interior of the lobes is white, with three purple lines running up to the base of an almost sessile column. The expanded portion of the lip at the extremity broadens out, forming a sweeping circular outline. The colour is of the richest amethyst, and contrasts well with the peach-blossom-tinted segments of the flower. *J. A.*

## METHODS OF PROPAGATION.

(Continued from p. 552.)

**PEARS.**—There are only one or two ornamental Pears worthy of culture, and these are best grafted on a Pear stock about 5 feet high. One is called the Willow-leaved Pear—*Pyrus salicifolia*, a native of Siberia—and has dark-green foliage, beautifully covered with silvery hairs on the under surface, which gives it during spring a very distinct appearance. The other, *Pyrus auriculata*, the eared Pear, is a very distinct-looking round-headed tree of large dimensions, and a very abundant bloomer.

### PLUMS.

The Plum is now too forward to be grafted this season, even in the north, as the operation should be completed in April. There are many good stocks for the Plum, and much of the special success in fruit-tree nurseries is due to a thorough experimental knowledge of the best one to select for different kinds. The Apricot, the Peach, and the Nectarine are budded on Plum stocks, but I will refer to this process at the proper season for its execution. The common Plum stock is one on which, broadly speaking, all-round Plums of the Orleans type may be worked, though there are exceptions even to this rule. Next in importance is the Mussel stock, used or most of the oval or egg-shaped Plums; then the Brompton stock, which originated in that suburb of London, and is used for budding the *A. ricot*, with the exception of that variety known as Brussels. Then there is the Cherry Plum, a stock much used on the Continent. The famous Deoyer's Victoria Plum thrives admirably on this, and it is suitable for all the Damsons and Bullaces; the union must be effected by budding, but it must be worked young, or the bark gets too thick and coarse, the bud being liable to be smothered by its rapid growth. In France and Holland, the Damask and St. Julien Plum stocks are much used, but these are too tender for our climate. The grafting process is essentially the same as in the case of the Pear or Cherry, but the bark being extremely tender, a very sharp knife must be used, or the effects of bruising will soon be apparent in the fatal gumming of the injured part, and for the same reason the tie must be prevented from cutting into the stock or scion. It should be added that the common Sloe (*Prunus spinosa*) serves as a stock for some Plums, and it has the same effect on them as the Quince on the Pear, inducing them to fruit early and freely. There is a double-flowered form of the Sloe, but except for its early-flowering character, it is not worth cultivation. It may be grafted on the Sloe, and even this, though usually a rough and unsymmetrical bush, may be grown into a respectable-looking tree. There are some good specimens in Eastwell Park, Kent.

A Plum which has been introduced to commerce recently will take a leading place in the arboretum or shrubbery; it is named after its raiser, *Prunus Pissardi*. I saw it used to great advantage at Baron Rothschild's, planted in masses with a few pyramidal silver variegated Maples (*Acer Negundo variegata*) dotted among the trees. The colour is not so dark as that of the purple Beech, but when one considers that nothing will grow under or near Beech trees, the value of the *Prunus* as a foliage tree or shrub will be recognised. This does well on any of the Plum stocks, but to form pyramids or bushes it is best worked on the Myrobalan; and to form standards, on the Mussel stock. *Experience.*

(To be continued.)

### A CURIOUS DEVELOPMENT IN RICHARDIA ELLIOTIANA.

—It is not an uncommon occurrence in the *Richardia* to throw twin flowers at the top of a stem. A few days ago, when visiting the Hassocks Nurseries of Messrs. W. Balchin & Sons, I saw a plant of *R. Elliotiana* that had produced a blossom, and at the back of it a huge bract, flattened out, golden over the greater part of it, and edged with green. Mr. W. Richardson, the foreman, stated that when first it developed the bract was almost wholly green, but was gradually becoming golden, and to all appearance of a deeper tint than the flower itself. *A Correspondent.*

THE CARNATION AND ITS CULTURE.

We have been favoured by Mr. Charles Blick with the following particulars of the practice adopted at

sand. To this add a plentiful sprinkling of charcoal broken up to about the size of Hazel-nuts. To every barrowload of the above mixture add a 5-inch potful of bone-dust, and the same quantity of blood-manure. Mr. Blick considers this

meter. If new they should be thoroughly soaked to get the dryness out of them; if old they should be well scrubbed. Porter's "Invincible Crocks" are strongly recommended, as they keep out worms and other insects; over these are placed about 2 inches of clean broken crock, then a layer of rough siftings obtained from the loam and manure. The pots being then half filled with the compost, is well compressed. The practice is to put three plants in each pot, the stronger-growing plants are put into 8-inch pots, and the weaker plants into 7-inch pots.

The soil is placed carefully round the roots of the plants, then shaken down and thoroughly rammed this being considered a very important point in Carnation culture, it being almost impossible to get the soil too firm. When potting is finished the plants are put into a cold frame, the lights being drawn off in all favourable weather. If the soil is in a proper condition at the time of potting, no water should be needed by the plants for a fortnight or three weeks; after this period if the weather is bright they may have a good soaking, after which most careful attention will be required. Towards the end of April the plants should be placed in the open, with full exposure to light and sunshine.

It has been found a good plan to put each class of plants by itself; thus, the selfs and flakes, bizarres, yellow-ground Picotees, and the white-ground Picotees. In May as the plants begin to throw up their flowering stems, or to spindle, they will require staking, and tying up. An observant eye should be kept for the green-fly and the spittle-fly, &c., which must be at once destroyed.

Towards the end of May and onwards, the plants should receive a top-dressing of blood-manure or other sustaining fertiliser, with an occasional application of weak liquid-manure. To make a good liquid-manure for Carnations, it is recommended to put a bushel of cow-manure and a 6-inch potful of soot into a bag, and immerse in a tub containing from 50 to 60 gallons of water. Use at the rate of one of the liquid-manure to two of ordinary water, which will be found serviceable in promoting vigorous healthy growth of the plants.

In order to obtain really good Carnations, it has been found that they require more extensive feeding than many gardeners are apt to be aware of, otherwise they soon show an exhausted appearance in their foliage. Great attention should be paid to cleanliness, removing weeds and dead foliage from the plants. Disbudding must be done as soon as the buds are large enough to handle, leaving two or three buds on each stem, according to the strength of the plant—say, the top, third, and fourth buds. Towards the end of June, or early in July, the plants should be taken into the flowering-house, otherwise, if left out-of-doors after the calyx commences to open, the thrip will sometimes get underneath the calyx-leaves, and when once there it is almost impossible to remove the pest. When all the plants are housed, they should receive a soaking of water two or three nights in succession. As the blooms begin to show colour, manure-water must be discontinued.

FIG. 90.—DENDROBIUM CYMBIDIODES.  
(Colour of the flowers creamy-white, changing to pale yellow.)

Warren House, Hayes, in the pot-culture of border Carnations.

The potting of border Carnations should be proceeded with during the month of February. The soil recommended is two parts good yellow fibrous leam, one part of well-rotted hot-bed manure, half a part of old lime rubble, and half a part of coarse silver-

the best artificial manure for the Carnation, because he has frequently noticed after a top-dressing of blood-manure, in about ten days or so, the fine fibrous feeding roots developing in a remarkable manner.

The compost should be turned several times, until each ingredient is thoroughly incorporated one with the other. The pots used are 7 or 8 inches in dia-

DENDROBIUM CYMBIDIODES.

THIS species is distinct from most Dendrobiums in habit of growth, in which particular it most nearly resembles the Bornean *D. Treacherianum*, and the Indian *D. amplum* and *D. Colognye*, all of which belong to the section formerly called *Sarcopodium* (a division of *Bulbophyllum*). The curious and pretty species here illustrated (fig. 90) is seldom seen in gardens, and probably few Orchid growers recognised it when the fine plant from which our illustration was taken was exhibited by Sir Trevor Lawrence at the meeting of the Royal Horticultural Society on April 21 this year. The flowers are creamy-white changing to pale yellow before they fade; the lip bears purple markings. The species was first introduced from Java about the year 1852, and since that time an occasional plant has appeared in importations from the same region. To cultivate it successfully, it requires to be placed in a warm and moist house when growing, and to be removed to the intermediate-house when the bulbs are fully grown.

## ATHYRIUM FILIX-FŒMINA PLUMOSUM, VAR. DRUERYI.

Of all the beautiful varieties of the Lady Fern that I am acquainted with—*Kalothrix* not excepted—none seems to me to possess the merits of the subject of this note. Why? Because, in the first place, it is nearly evergreen; that is to say, it is the last to lose its fronds, and the first to reproduce them—which is in itself a characteristic not to be despised. But, apart from that, this unique variety is so full and foliaceous in the frond, and yet so finely divided, that I cannot compare it to anything else than such lace as a princess might be expected to wear on a state occasion.

Mr. Druery, however, seems to be in favour of *Kalothrix*, for he writes, "This stands alone among our British varieties for delicate beauty." But, possibly, this description of *Kalothrix* was written before *Drueryi* was born. If so, then I can understand this well-merited eulogium being preferentially given to it. But *Drueryi* has other good qualities. It grows freely, is easily propagated, and continues to throw up fronds nearly all the year round. From one plant acquired two years ago, I now have four good pieces—or had, as I have been obliged to part with one to a pterophile—if I may call him so—who made such strong representations to the ferny side of my nature that I could not do otherwise than acquiesce. With reference to the lasting qualities of this Fern, I may say that it retained its fronds last year right up to Christmas, and that a particularly pleasing specimen now occupies a 6-inch pot, and possesses between twenty and thirty pretty fully-developed fronds of the most exquisite golden-green. In addition, then, to its beauty, it may be said to be practically evergreen. In fact, I dub it the "Rose" of the Lady Ferns; and, in the same sense, the term perpetual—substituting frond for flower—may be not inappropriately applied to it. If, then, I appear to give this preference, it is because I consider it to be the *Todea superba* of Lady Ferns. *C. B. G., Acton, W.*

## FLORISTS' FLOWERS.

### THE GOLD-LACED POLYANTHUS.

I HAVE never before seen such a mass of large plants in full bloom as there is at the present time at Mr. W. J. James's, Woodside, Farnham Royal, Slough. There are probably 300 fine specimens occupying a border at the foot of a hedge, and which has a north aspect. The plants are two years old, full of blossom, and many of the varieties worthy of being named. They grow with wonderful vigour in the strong clayey loam of the district, which appears to suit them exactly. Let no one say after hearing of such plants as those at Farnham, that the gold-laced *Polyanthus* is difficult to cultivate. The way to have strong plants is to sow in the autumn and plant out in the spring, and the following year the plants will bloom freely. Three or four months are gained by this proceeding.

### THE FLORIST'S TULIP.

Such a title as this is necessary, in order to differentiate the late-flowering exhibition Tulips from the early-blooming bedding varieties, the latter being also very useful for potting for decorative purposes, as they do well in pots with appropriate management; but the late varieties are not only generally taller in growth, but they do not lend themselves to cultivation in this way. They are planted at the end of October or early in November, in carefully-prepared beds in the open, the usual rule being to have a bed raised above the ground-level, carefully drained, and the Tulips planted in seven lines running lengthwise. The planter having a knowledge of the growth of the different varieties he cultivates, places the tallest growers in the centre of his bed, the next tallest comes on either side, the dwarfier varieties at the sides. Some cultivators mix their varieties, and when this is done, there is a more varied attractiveness when the plants are in flower, the rectified

forms—bizarres, byblomeus, and roses mingling with the unbroken selfs or breeders. Some plant their bizarres together, their byblomeus and roses also, and then their breeders; when this is done, the exhibition blooms are more readily picked out, but the general effect is less pleasing.

When planted, the bulbs being underground, they are left to the mercy of the weather till the foliage shows above the soil. Some of the bulbs, whether from lack of size, or some constitutional defect, will produce but one leaf, and however large and vigorous it may be, no flower will be produced. The old school of florists denominate these "widows." If two leaves be produced, bloom may be looked for; and, barring accidents, a bud will develop in due course.

March and April are the months which reveal to the cultivator, by the appearance of the foliage, something of a forecast of bloom. If all have gone well, he may look forward with pleasurable anticipation; if anything be wrong, the foliage will show it. Sometimes a keen disappointment is experienced; all goes to appearance well, until the time when the buds should be showing above the soil, then almost suddenly, a disastrous change comes, from some cause, perhaps oftenest, from being planted in harmful soil, the leaves lose colour and decay. In one of his pleasant articles upon the Tulip, the Rev. F. D. Horner says: "The old bulb is able, without aid of roots, to support leaf-growth thus far, and so to a considerable degree; but by April, the time has come when it is naturally a good deal exhausted, and it is time for the root-fibres to take up the work and supply a large share of food for the elaboration of leaves and blossom. If the fibres are dead, all this process fails, and any strength the old bulb may still have will be directed towards saving the life of the plant, by doing what is possible towards the formation of the new bulb, which, in the loss of its natural supporters, the leaves and fibres seem left, as it were, a vegetable orphan!" A sharp oversight is necessary when the leaves expand and acquire strength, for harm can come to the incipient flower through the leaves. Though the Tulip is very hardy, "and will not bear cutting, or any robbery of light or air, yet it may be seriously injured if exposed to hail-storms and high cutting winds, and any hurt to the leaf is sure to affect, in some measure, both the bloom and the future bulbs." When the leaves are frozen, and bright sunshine falls upon them when in this condition, much mischief may be wrought, hence the importance of a cover when the spring nights are cold and frosty. Shade from the sun is as important as protection from frost; and harm is also done to the leaves when stiffened by frost, if they are rudely stirred by the wind. "A critical time for the young plants," says the Rev. F. D. Horner, "is when they are just at the ground-level, enfolded in the heart of leaves. These frequently hold the rain-water sufficiently to surround or cover the buds, and in severe spring frosts they will be frozen up. The water can be liberated by gently opening the leaves, or by blowing it out with a tube, such as a length of small-bore gas-pipe; and it is worth while either to prevent the water from being frozen, or to dislodge it altogether. As the flower-stems rise, the greatest enemy to be feared is hail; it is sure to mark the foliage, and every shot that strikes the green bud is likely to bruise it, and leave a mark that will not only appear on the flower, but also be a source of weakness, whereat decay of the petals will first, and probably prematurely, set in." All this shows the importance of some protection being afforded the plants from frost and hail in April and May, as well as from sunshine and wind when the Tulips are flowering.

The National Tulip Society will shortly hold a southern show in the Temple Gardens, in connection with the exhibition of the Royal Horticultural Society; and the public will have opportunity of inspecting one of the flowers which the florist rated at a high value. It must be admitted that the manner in which the flowers are shown is hardly likely to attract the flower-loving public. Last year there was an entire absence of anything like uniformity in the

stands—while flowers in bottles, without much attempt at arrangement, do not constitute an artistic display. *R. D.*

## ARLE COURT, CHELTENHAM.

THE extensive grounds around Mr. T. B. W. Butt's residence of Arle Court, are of a naturally picturesque character, and certainly favoured the efforts of the landscape gardener who created them. Viewed from the high ground near the house, many varied and pleasing pictures become visible, among which are the lake bordered with rocks, and its rustic bridge; the spring garden, bright with the varied colours of early-flowering herbaceous perennial plants and bulbs; the well grouped clumps of flowering and other shrubs arranged on the well-kept lawn, and all having a charming background in the soft green of the distant woods.

Hardy plants are much employed in the embellishment of the gardens at Arle Court, and the show which they have made this season, and are still likely to make, is a very fine one. Many of the early alpine have flowered profusely, and they have been earlier and brighter in bloom, and better than is usually the case. The species of Tulips have flowered uncommonly well, especially *T. Greigi*. The most showy plants in the gardens probably have been the *Fritillarias* or *Crown Imperial*, large masses of whose bulbs having been left undisturbed for some years, made this year a very fine show of flowers on very strong stems, none of which failed to bloom.

The *Auricula* and the different types of *Polyanthus* and other hardy *Primulas*, of which the strains at Arle Court are very good ones, are also making a beautiful display. The entire garden is in such order as to reflect credit on Mr. Marsh, the head gardener, who appears to take as much interest in the small as in the greater matters under his care.

### THE GLASS-HOUSES

are connected with the residence by a series of glass-covered corridors, one side of which is covered chiefly with large plants of scarlet-flowered *Pelargoniums*, which look beautiful in foliage and flower. These are trained to cover the walls from the bottom to the top. Usually one sees some of the coarser-growing varieties used for this purpose, but here the favourite bedder *Vesuvius* is the one chiefly made use of; and few of those who are accustomed to see the plant as a neat pot-plant or bedder, and to praise it for its dwarf habit would suspect that it is so well adapted for covering the walls of a greenhouse or corridor. In all cases, however, it maintains its good name for the brilliancy of its colour and its floriferousness. At one point in the corridor a pretty rockery is found; and in the large *Camellia*-house a good prospective show of blooms, and a present display of neat plants of *Azalea indica*, *Clivea miniata*, *Hippeastrums*, &c.

The flower-house, which is a part of the block of plant-houses, contains a fine show of *Cyclamens*, *Cinerarias*, &c.; and in other houses it was observed that *Primulas* and other greenhouse florists' flowers are well represented; but in the matter of plant culture, it is evident that—

### THE ORCHIDS

take the lead, and worthily so, grown, as they are, in a very satisfactory manner by Mr. Marsh, Cattleyas, *Lælias*, *Dendrobiums*, *Odontoglossums*, and a few other showy genera, are those chiefly cultivated, and the plants throughout exhibit evidence of good and careful management.

In the Cattleya-house there is at the present time an excellent show of *C. Schroderae*, *C. Mendeli*, and a few late *C. Trianaei*, *C. Mossiae*, and splendid plants of *Lælia purpurata*, which are well furnished with blooms about to expand.

In another house are plants of showy species of *Dendrobium*, and in a warm corner of the same, some nice well-flowered *D. Phalaenopsis Schroderianum*, which are excellent as examples of good cultivation.

In the cool-houses, well-bloomed varieties of *Odo-*

toglossum crispum are noteworthy, as are also some *O. triumphans*, *O. Cervantesii*, *O. gloriosum*, *O. cordatum*, a very beautiful *O. nebulosum*, *O. luteo-purpureum* varieties, *Lycaste Skinneri*, *Ada aurantiaca*, *Oncidium Marshallianum*, *O. concolor*, and *O. sarcodeis*, all of which are especially fine. Plants of the pretty *Pinguicula caudata*, which seem to grow well only with the cool Orchids, were remarked; also some bright *Masdevallias*, and very healthy and finely-flowered *Cattleya citrina*, some of which have been grown and flowered annually, an experience which many cultivators cannot claim to have done. In a warm division, arranged among foliage plants, and with variegated *Panicum* as an edging to the staging, some excellent varieties were remarked of *Miltonia Roezlii* and *M. R. alba*; thriving plants of *Phalenopsis*, *Cypripediums*, and many other things, all of which showed care in selection and judicious cultivation.

The large kitchen garden, it may be observed, is in excellent condition; and that within its walls many rare and interesting hardy plants find suitable shelter.

## NURSERY NOTES.

### MR. JAMES' FARNHAM ROYAL.

The extent to which *Cinerarias* are grown for seed is shown by the 3,000 plants Mr. W. J. James has in flower at Woodside at the present time. The plants, in 32-sized pots, fill several span-roofed houses, and they carry fine heads of bloom. The frequenters of London horticultural shows and meetings are acquainted with Mr. James' fine strain of *Cinerarias*, which is dwarf, compact, and bushy, with dense heads of bloom, which are of fine quality. The plants are arranged in groups, each of which consists of a distinct self or margined variety, for experience teaches that many of the seedlings will come true to the type from which the seed is saved.

The beauty of the Farnham strain throughout is enhanced by a dark-coloured disc present in every one of them. A dark disc is a desirable feature in the florists' *Cineraria*, and its value in giving expression to the flower is obvious, as a dark disc goes admirably with almost any kind of colour, as do the gold tube in the *Auricula* and the pure base in the *Tulip*. It was satisfactory to notice that though size of bloom is still a leading characteristic, Mr. James is constantly striving to obtain fine form and good substance—two indispensable characters with the florists of fifty years ago. Some of the blue and white selfs in particular are of moderate size, but of perfect form; while the blue shades, whether dark or pale, are always decided. In order to maintain the excellence of his strain, seeds are saved from only the finest types. To obtain seed-bearers the seed is sown in the month of July. *R. D.*

### CALADIUMS AT VEITCH'S.

From the early commencement of summer until its close, a considerable share in the adornment of the stove and warm plant houses in most gardens falls to the *Caladium*. The usefulness and extreme beauty of the plant are quite sufficient to make it worth the while of any gardener to use his best efforts to obtain from his collection what is possible only from plants which are well and skilfully treated. In many places though the *Caladium* is admired for the delicate beauty of its foliage in the hottest of the houses, the idea prevails that it is by no means useful as a decorative plant in the dwelling-house, and owing to this its furnishing value, by no means inconsiderable, if proper means are taken to prepare the plants before they are required for such purpose, is forfeited. The collection should be large enough, that the gardener may keep a good representative group in the hottest house he has at his disposal, and in that structure the plants will be happiest, and develop the finest effect. Others, however—and in this case the varieties should consist of the less valuable ones, excluding all new varieties that are possibly weaker than others, owing to the excessive propagation they have been the subjects of—should

be taken to an intermediate-house or warm greenhouse when the plants have become well established towards the middle of May or even the commencement of June. From hence, provided the atmosphere is not allowed to become charged with excessive moisture, the plants may be removed to suitable positions in the dwelling-house, and they will sustain no injury whatever. We have been led to make these remarks through a belief that the *Caladium* has not been used for this purpose to the extent it might be if due care be given.

Our purpose in this note, however, is to notice a few of the novelties that Messrs. Veitch are sending out during the present season. In the first place, it is satisfactory that all of them were raised by the late Mr. C. F. Bause in his nursery at South Norwood. Without intending any discourtesy to our continental friends, from whom we gladly take what novelties in horticulture they have to offer us, it

FIG. 91.—*POSAQUERIA MACROPHYLLA*: TO SHOW HABIT. (SEE P. 586.)

is none the less with pleasure that we have to notice a set of English-raised *Caladiums*. It is an uncommon experience, and the fact affords additional testimony to the skill of Bause as a plant-grower, and particularly as a raiser of new decorative plants. Messrs. Veitch have their plants in a span-roofed pit, where they have the advantage of abundance of light [being very close to the roof-glass], a fairly humid atmosphere, and as much heat as it is thought desirable that they should receive. In this structure the plants have commenced to assume an exceedingly fine appearance, and if the plants are less in size than they may be seen after midsummer, there is a freshness about the collection that may be less perceptible when we have seen similar plants at the summer exhibitions. The first of the new varieties that came under our notice was *Sir Henry Irving*, which has already been described, the plant having received an Award of Merit from the Royal Horticultural Society. The centre of the leaf is creamy-white, marginal portion green, variously mottled with pale yellow and white. The veins are very distinct, being bright rose-coloured; size of leaf rather larger than some of the others noticed. *Marquis of Camden* has leaves of

deep blood-red, especially deep near the veins. Narrow margin of green, and some smaller green-coloured veins, occasionally spotted pale colour; the leaf is large, and the plant has a good habit. One of the new ones exhibiting a specially dwarf habit is *Lord Derby*. It may be said to resemble in some measure the variety *Madame Jules Precot*, but the novelty is dwarfer and more brightly coloured; the colour may be briefly described as pale rose, with veining of deep green. Next is *Mr. J. Pierpont Morgan*, a variety of seemingly capital habit, producing early quite a bunch of leaves; these are carmine or rose, more or less reticulated with green, with deep green veining, a very pretty and valuable variety. A plant of *Sir William Broadbent* had produced upwards of twenty leaves in a 7-inch pot. It is one of the blotched section, the interspaces between the carmine-coloured veins being green, but densely blotched with white; narrow margin also green. The variety *Sir Julian Goldsmid* is of very dwarf character, has a finely-shaped leaf of average size, colour of the blade silvery, but afterwards becoming suffused with red, the veining being of this colour. In *Silver Cloud* we have a very attractive variety, and one of the most delicate in colour; it is very palest flesh and silver, the one more prominent on this leaf, and the other on that—a carmine spot, where the veining originates, enhances the beauty of this very charming plant. Another of the reticulated section is *Duchess of Fife*; the leaf has a pure white ground, reticulated much with dark green, veining being rose-coloured. The following three are not yet in commerce, but we have no hesitation in describing each of them as being excellent acquisitions. Taking *Lady Mosley* first, it is almost a self-coloured variety. The veins are crimson, the interspaces rather carmine than rose, and has narrow green margin to the leaf. The footstalks are pale carmine with green lines running longitudinally—a very distinct and desirable variety. *Her Majesty* is one of the most attractive *Caladiums* we remember to have seen. The colours are gold, pea or apple-green, and silver; just at the stage at which we saw it, it had a netted appearance, reminding one of a charming *Melon*. The veining, as well as the margin of the leaf is green, the remainder silvery-white, with gold to carmine markings at the bases of veining. *Leonard Bause* has leaves slightly narrower, more arrow-like in shape, and may be recommended. The ground is white, with a dark red spot at the focus of veins, the largest of which are carmine; pale lilac, pea-green, and sulphur-yellow may be also detected in the leaf of this variety.

The above are the whole of the varieties sent out from Chelsea this year, and raised by Bause. In describing them briefly, it was the writer's desire to depict them exactly as they were seen, and leaves that had "characterised" were as far as possible selected for notice; but, as most of our readers know, there is no plant with foliage that continues to vary more in colour than the *Caladium*, and an intending buyer must not expect a plant to present on the first or every occasion he sees it the exact appearance he has seen described. The newer varieties undoubtedly possess an advantage over the old-fashioned large-leaved kinds in regard to habit, being dwarfer and requiring less attention in staking, and they have generally brighter-coloured foliage. Hints upon the culture of the *Caladium* and its propagation were given on p. 137 of our present volume, by Mr. J. F. McLeod, of Dover House Gardens, who cultivates them very successfully, and who has now a fine collection, including almost all the novelties.

## VARIORUM.

**SATURDAY HALF-HOLIDAY AT CHISWICK.**—We understand the Council of the Royal Horticultural Society has decided that all the persons employed at Chiswick are in future to have a half-day's holiday once a fortnight. By dividing the staff into two batches, one of which remains on duty, whilst the other is on leave, all difficulty with regard to the necessary work is surmounted.

## CULTURAL MEMORANDA.

## THUNIA MARSHALLIANA.

DURING the last few weeks I have had several plants of this very useful and highly-effective Orchid in fine flower; they are in 6-inch pots, containing a compost of equal parts of turfy loam and peat, with a little sphagnum added. The whole was pressed firmly together, and good drainage afforded. Each plant consists of from five to six erect reed-like, leafy stems, 20 inches high, which are furnished with seven pairs of perfect oblong-lanceolate acuminate pale green leaves, 9 inches long and 1½ inch across in the centre, each stem being surmounted by drooping clusters of seven and eight flowers each. The spreading sepals and petals of the individual flowers are white, the lip is also white outside, the interior frilled, and streaked and furled with golden-yellow, tipped with white, which contrasts most effectively with the petals and sepals. After these plants have matured their growth, water should be applied very sparingly to the roots, and sufficient only being given to prevent the growth of the current year from shrivelling. The plants should also be removed to a coal-house until February. They should then be turned out of the pots, and the old soil shaken from the roots, after which the latter should be cut well back. Re-pot as described above, and keep them in the Dendrobinm or Cattle-aye-house, or a plant-stove, in a position near to the roof-glass. Keep the roots moist, and when the young growths have become a few inches high, tepid liquid-manure may be afforded them with advantage. Plants treated thus will flower early in April.

## TREATMENT OF DEUTZIA GRACILIS AFTER FLOWERING

As soon as the beauty of the plants, which have been forced, has waned, the old shoots should be cut down to the level of the soil, thus allowing space for the current season's shoots to develop. If it is deemed necessary, the plants may be turned out of the pots, the old soil shaken off the roots, the latter shortened back, and repotted in clean pots of the same size, or of a size smaller than those they came out of, according to circumstances; affording good drainage, and using a compost consisting of about three parts fibrous loam and one of leaf-mould, with a small quantity of sharp sand or "crock-dust." Then place the plants on a bed of coal-ashes in a pit or frame facing south or south-west; afford them water at the roots, keeping the frame close and shaded for a few days during the hottest part of the day, till they have become re-established. It will hasten the growth of the plants if they are syringed with tepid water in the afternoon when the frame is closed and the shade removed. When fully re-established no shading is required, but air should be freely afforded during the heat of the day, and the watering of plants well attended to, giving liquid-manure occasionally. In July plunge the pots in a bed of coal-ashes out-of-doors. H. H. W.

## IRELAND.

## THE LARCH DISEASE.

SOME questions having arisen as to the frequency of the occurrence of this disease in the Sister Island, we are pleased to lay before our readers the opinions in brief of some of the most eminent foresters and gardeners. In the North-west (Newton Stewart), Mr. Robert Bell says the Larch-blight scarcely exists in the 3000 acres of mixed plantations under his charge. Upwards of 3000 tons have been sold this year, with no complaint as to the quality of the timber. Three hundred thousand trees were uprooted or broken within twelve hours in the hurricane of December, 1894. It will take years to clear up the havoc. There is a ready market for everything but Scotch and Spruce, for which there is only a local demand.

Mr. Whylock reports from co. Wicklow that there is very little Larch-blight on the estate of Coolattin, where the plantations consist of a mixture of Larch, Scotch and Silver Firs, and Oak. The soil is poor and thin on the hills where the Larch thrives. The disease occurs in a plantation on a flat piece of land on either side of the river, where the soil is heavy and wet. Alder and Birch do well in such soil, and nothing else should be there. Scotch Fir does well. There are several about 100 years old, and all that can be desired for cutting into boards, but the price

is too dreadful. One of these 100-year-old Scotch sold for 2s. 6d.! Mr. W. G. Mitchell writes that, from considerable experience in co. Wicklow and in Cork, he can say he has never seen the Larch disease in either county. The only thing he has to contend with is heart-rot or "pumping," and that only occurs on limestone-soil. From Ashford, Galway, Mr. Coupar records that the Larch is very free from disease, though there are a few cases here and there in low-lying, damp spots.

## SPRING AT GLASNEVIN.

It has been a wonderful spring; no frost to injure young growths, and wind not too harsh. Flowering trees and shrubs were better than I ever remember them. *Magnolia conspicua* and *M. c. Soulangiana* were quite covered with flowers. *Berberis stenophylla* and seedling forms of this, *B. Darwini*, *B. aquifolium* and varieties, are very fine. *Cytisus biflorus* (which passes under a host of other names) is the earliest of its class, and is also a valuable acquisition in any garden; it is very floriferous, and quite hardy. *Prunus (Padus) cornuta*, an interesting and scarce Himalayan plant, is flowering here for the first time, as far as I can ascertain. To-day (April 20) the first Rose, *Safrano*, opened against a wall, and I notice the *Laburnum* and *Horse-Chestnut* also in flower. *Glusnevin*.

## THE WEEK'S WORK.

## THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Villa, Trinj.

**PUTTING OUT BEDDING PLANTS.**—This should not be too hastily commenced. Although the days be fine and warm, the nights will still be treacherous, and by undue haste in planting the beds, many plants may be sacrificed. None but those that will resist a few degrees of frost should be planted for a week or two. The crowded condition of the frames and houses may be tolerated a short time longer.

**PLANTS FOR FURNISHING BEDS.**—Late-struck *Pelargoniums* may be kept growing for a short time longer in a warm pit or frame, but harden them off about the end of the month; also such plants as *Begonias*, *Petunias*, *Zinnias*, *Dahlias*, *Balsams*, *Ricinus*, *Solanum*, *Nicotianas*, *Zeas*, &c. Cuttings of *Asterantheras*, *Ageratum*, *Coleus*, and *Iresines* may still be inserted in sandy soil, and placed in a Cucumber or propagating-house; they will be useful for later work. Proceed with the potting-up of all rooted cuttings and seedlings, and move all established plants into cooler quarters to harden, preparatory to planting out. Dot plants intended for use in the general bedding should be kept growing. These may include such plants as *Ivy-leaved Pelargonium*, *Fuchsias*, *Heliotropes*, *Plumbagos*, &c. If these be partly trained to neat stakes at the desired height, before they are planted out, they will provide an effect immediately. The stiff formal style of bedding has latterly been displaced to some extent by a freer and less exclusive system, so that many plants once considered very unsuitable for the flower garden, are now freely used. *Pentstemons*, *Antirrhinums*, *Japanese Anemones*, *Delphiniums*, *Rudbeckias*, double and single *Pyrethrums*, *Carnations*, and many similar plants give additional grace and beauty to our summer and autumn display. Beyond this, they are hardy and withstand wind and rain without serious damage. *Herbaceous Phloxes*, if required as bedding plants, should be grown in pots up to the present date, for if they are lifted now and transplanted they will be apt to suffer greatly. These *Phloxes* are very effective for massing in large beds. If any are used in the beds on the lawn, they should be planted thinly at regular intervals, and the ground carpeted with some dwarf-growing plants. Before planting them, give the beds a good dressing of well-rotted manure, and as the plants make their growth render them secure from wind by neatly tying them to stakes.

**ROSES AND OTHER CLIMBERS**, on walls, arches, and trellis-work, are generally badly infested with green-fly; the recent dry weather has encouraged these pests. An infusion of Quassia-chips and soft-soap is an excellent remedy, so also is tobacco-water. One or other of these remedies should be applied with a garden-engine or syringe without delay; afterwards the plants should be syringed vigorously with clear water as a cleansing. If mildew has made its appearance, a mixture of sulphur and soft-soap, at the rate of an ounce to a gallon of water may be used.

I have also used, with great satisfaction, an insecticide known as "Killmright."

**THE ROCK GARDEN AND FERNERY** will now need a little attention to keep the plants free from weeds, or they will overrun the weaker-growing plants. Decaying flowers and stems should be removed, and the walks weeded and made tidy, but not formal looking.

## PLANTS UNDER GLASS.

By JNO. MCINTYRE, Gardener, Woodside, Darlington.

**CHRYSANTHEMUMS.**—Collections of these plants will now require very careful attention. They should continue to make growth without a check till the flowers are fully developed. If all the plants have been potted twice, and a period of three weeks or so has elapsed since the strongest were done, it is probable that the latter have almost filled their pots with roots, and are, consequently, ready for removal to pots in which they will flower. Preparations for this final shift should be commenced at once. Soils should be put under cover, so that they are ready for use at any time. This precaution is doubly necessary at places where such work as mixing soils is only done upon wet days. Growers differ greatly in their opinions as to what is the best compost for the final potting of Chrysanthemums. But one has to make the best of what is at hand; and as loam forms the principal ingredient, the grower may find it necessary to modify its character. Should it be too heavy or clayey, materials must be added to lighten the compost; if, on the other hand, the loam is light and sandy, ingredients should be used which will tend to solidify it. I have mentioned two extremes in soils, but the best for this purpose is a moderately-strong loam containing plenty of fibre; such a soil should form two parts of the compost, and another part may be added of horse-droppings as prepared for a Mushroom-bed. Add a moderate quantity of soot, say a 4½-inch potful to a barrow-load of soil, wood-ashes, and only partially-broken charcoal. Thoroughly mix all together, and it will make a compost which should produce good results. All the pots should be thoroughly clean when used, and the crocking of same requires to be done with care. If the drainage should become impaired, the injurious effects on the plants will be only too apparent, and the slightest sunshine will cause them to flag. It may be thought that a good compost and careful potting are the principal items in successful culture. Admitting, however, that these are important points, I believe that unremitting care in the treatment of the plants afterwards is even more essential. Chrysanthemums can very easily be supplied with the food they require, either by liquid-manure from the farmyard or by chemical preparations. Each grower should make his own selection in regard to these, but here we have found nothing better than the liquid from the farmyard, with the addition of soot. The plants being thus easily supplied with stimulants, rich composts when potting are not desirable. [For special manures for these plants, see *Gardeners' Chronicle*, vol. xv., p. 779. Ed.] Careful watering after potting is of the utmost importance, and as the time is now approaching for turning the plants out-of-doors, they should be gradually hardened by removing the lights daily, and only on the occurrence of very cold nights should these be returned over the plants.

**DRACÆNAS** propagated from eyes last season should now be growing freely, and may be potted into 5 or 6-inch pots. If a dozen or so of *Paucum* (*Oplismenus*) *Burmanni* variegatus cuttings be pricked in the surface, they will soon root, and such a surfacing will add much to the appearance of the plants when used for decorative work, or on the dinner-table.

**POINSETTIAS.**—Cuttings ought now to be ready for shifting on. Use good loam and leaf-soil, two parts of the former to one of the latter. If a low span-roofed house is available, it is the best structure for them whilst making their growth. They should be given a temperature of 85° in the day and 70° at night. Once the plants are established in the new soil, and are growing freely, give increased ventilation. If cuttings have not been struck, it is not yet too late for the process, and if *Poinsettias* have to be grown in great quantity it is best to have two batches. The late plants will be fresh late in the season but their bracts will not be so fine as those produced by the plants struck earlier.

**EUPHORBIA JACQUINIÆFLORA** is a capital plant for covering walls in the stoves, and grown in this manner it will produce an abundance of bloom, besides the sprays are much longer, and

brighter in colour than when grown in pots. I have seen back walls of late vinerias clothed with this plant, and they bloom well in houses where a little heat is required during the winter to preserve late Grapes from damp. Euphorbias delight in a compost of good loam, leaf-soil, and old lime-rubbish, loam forming two parts of the whole. Give every encouragement to free growth during the summer months, whether in pots or planted out.

**THE ORCHID HOUSES.**

*B. W. H. WHITE, Orchid Grower, Euford, Dorset.*

**EAST INDIAN DIVISION.**—A great portion of the cultivator's time will now be taken up in watering, ventilating, and shading. In the hottest division, Orchids, such as *Aerides*, *Saccolabium*, *Angraecum sesquipedale*, and smaller-growing plants of the same family, the warm-growing *Vandas*, and others that are potted in crocks and sphagnum-moss, will require a moderate quantity of water at the roots throughout the growing season, affording just sufficient to keep the moss on the surface fresh and green. The whole of the *Cypripedium* will require copious waterings; exception must, however, be made as regards the *C. bellatulum* section. These should be given thorough soakings at long intervals. If kept constantly saturated, their roots at length decay, and the foliage becomes spotted and diseased. *Dendrobium*s suspended near the roof in small pans or baskets, with little moisture-holding material about them, will need water oftener than those grown in pots upon the stage. *Calanthes* of the *vestita* section must still be watered with discretion until they are thoroughly well-rooted; they are very susceptible to injury from over-watering. If the roots show signs of discoloration, or the tips of the young growths turn black, water should be discontinued immediately. If in a short time the surface-roots are making a fresh start, and the growths renew their activity, very careful watering is again necessary; but if no improvement is evident, the best policy is to turn the plants out of their pots, cut off the diseased growths, and plant them again firmly in small pots, using sphagnum-moss only, and when they commence to grow again, treat them as advised in a former calendar. *Thunias* now growing vigorously will appreciate an occasional dose of weak liquid manure-water. The heat-loving *Oncidium lanceanum* and *O. hematocilium*, although rooting freely, must be very carefully attended to, as their large succulent leaves are liable to become spotted if kept constantly moist at the root. It is sometimes advisable to allow them to remain dry for a day or two before giving more water. *Catasetum*s, *Cycnoches*, *Mormodes*, *Cyrtopodium*s, &c., will require abundance of water as they become well-rooted. Among miscellaneous Orchids that are usually grown in this division, as *Bulbophyllum*s, *Cirropetalum*s, *Sarcopodium*s, *Megacilium*s, *Ericas*, *Microstylis*, *Arundia*, *Spathoglottis*, *Coliopsis*, *Brassavolas*, *Scuticarias*, &c., should all be copiously watered during this their season of growth.

**INTERMEDIATE HOUSE.**—The tall-growing *Epidendrum*s, *Sobralias*, *Ceoglynes*, and *Pleiones* should be watered frequently, and they may be greatly benefited by periodical waterings of liquid-manure. *Vandas* of the tricolor and *suavis* sections should not be too freely watered at the root, but afforded only just sufficient to keep the moss on the surface in a fresh condition. The beautiful *Saccolabium coeleste* will require similar treatment to the *Vandas* as regards moisture, but now that it has commenced to grow and root, a lighter position is necessary than for those species. *S. coeleste* may be re-potted or top-dressed, using drainage nearly up to the rim of the pot, and surface with a thin layer of living sphagnum-moss. Such plants as *Cypripedium insigne*, *C. villosum*, *C. Boxalli*, *C. Leeannum* x, *C. venustum*, *C. Charlesworthii*, *C. Spicerianum*, *C. Arthurianum* x, *C. Fairieanum*, *C. Crossianum* x, *C. Schlimii*, *C. superbieus*, *C. adrastrum* x, *C. vexillarium* x, and *C. Niobe* x, all do well in a shady part of this house, if supplied with sufficient water. *Zygotetalmus*, *Calanthes* of the evergreen section, *Arpophyllum*s, *Stanhopeas*, *Gonoras*, &c., if well-rooted, should be thoroughly soaked each time they become dry. Plants of *Miltonia vexillaria* that are now sending up their flower-spikes should not be watered too freely. Plants of the hybrid *M. Bleuana* are commencing to grow, and may be re-potted if necessary; they will grow freely during the summer months in the coolest part of this division. *Miltonias* of the *spectabilis* and *Moreliana* section are rooting and growing vigorously suspended close to the roof-glass; abundance of water must now be given them until growth is completed.

**MEXICAN-HOUSE.**—The Mexican *Laelias* should now receive every encouragement. Give more atmospheric moisture when closing in the afternoon, plenty of sun-heat, and a gradual increase of water at the root.

**COOL-HOUSE.**—*Odontoglossum*s, *Oncidium*s, *Sophronites*, *Maxillarias*, *Pleurothallis*, *Masdevallias*, *Ocoteonias*, *Epidendrum vitellinum*, *Dendrobium Jamesianum*, *infundibulum*, and *Wattianum*; *Mesospinkidium*s, *Cochliodas*, &c. should be watered each time the compost becomes the least dry. Disas, if well rooted, will require almost unlimited supplies of water. *Oncidium cucullatum*, *O. nubigenum*, *O. Phalenopsis*, and *Pleione humilis* should be kept in an airy position in the coolest part of the house, and be kept always wet at the root.

**THE HARDY FRUIT GARDEN.**

*By G. WOODGATE, Gardener, Rollston Hall, Burton-on-Trent.*

**INSECTS.**—Caterpillars of several species having now begun to feed on the leaves and shoots of the Pear, Plum, and Cherry, means should be taken to destroy them. Badly-infested trees in the garden, and on walls and espaliers, should be examined for the caterpillars once a day for some few weeks to come. If, as is the case with some caterpillars, they have spun the leaves together with a web and thus concealed themselves, the leaves should be carefully unrolled, and the caterpillars caught, this being a matter of great importance in the case of leading shoots and those intended for the extension of the trees. The disbudbing of shoots and stopping of laterals will usually remove great numbers, and the disbudbler should carry a basket when at work to hold the leaves and young growths removed from the trees, instead of allowing these to fall to the ground, and he should burn these trimmings forthwith. Pear and Plum trees on walls require much the same kind of disbudbing and stopping as that advised for the Apricot, viz., allowing the shoots for extending the trees, filling up blank spaces, and taking the place of worn-out branches to grow unchecked; but stopping at the third large leaf, the shoots which are left to form the fruit-spurs. The latter should not be so numerous as to crowd each other when the foliage is of full size. All other shoots should be removed. Old fruit trees are often observed with long, unsightly spurs sticking out from the face of the trees to a distance of from 9 inches to a foot, which it is advisable to shorten. To do this without much loss of produce, a well-placed shoot forming at the base of a spur should be encouraged by affording as much light as possible, and a better chance of growing vigorously afforded it by cutting off a few of the leaves on the adjacent spur. These old spurs, after the crop is taken, should be cut back to a point just above the young shoot that has been left, which will have the effect of imparting strength to the latter, and aiding in the formation of flower-buds. With this kind of treatment, partially worn-out or aged trees may be re-invigorated and improved in appearance. Cherry trees on walls are usually encumbered with the fallen petals of the flowers, which, if not removed, afford a harbour for many kinds of insects injurious either to the foliage or the fruit. The gardener, in going over his trees at disbudbing time, should remove and burn these accumulations, and afterwards afford the trees a washing with the engine or a powerful syringe.

**THE KITCHEN GARDEN.**

*By C. HERRIN, Gardener, Droghda, Mayo, Ireland.*

**BRUSSELS SPROUTS.**—Plants from the first sowing, if of sufficient size for planting, may now be set out, and, if possible, on a dull or showery day. It is good practice to draw shallow drills, 2½ to 3 feet apart, and dibble in the plants in these at from 2 to 2½ feet apart. Unless rainy weather set in immediately after planting, water should be at once afforded, so as to settle the soil round the roots, no further watering being necessary unless the weather should become very dry. The plants raised from the later sowing will be ready to prick off into nurse-beds at 2 or 3 inches apart, transferring them to their permanent quarters as soon as the plants touch each other.

**ASPARAGUS.**—At present the hoe should be kept at work amongst the plants, especially those newly planted and the beds of one year old plants. Should the present dry weather continue it will be advisable, after the hoeing is finished, to mulch the beds or lines with some partially-rotted manure, and a plentiful watering; in any case the mulching will favour a strong start in the newly-planted crowns.

Asparagus beds which are being cut from should be afforded a dressing of common or agricultural salt, which will answer the double purpose of destroying small weeds and promoting free growth. It may be useful to amateurs to be reminded that in gathering the heads of Asparagus a knife should not be employed, but the head removed by firmly seizing it between the thumb and fore-finger near the base, and twisting it, which will readily detach it from the crown. To do this properly, the soil should be removed to a depth that will allow the head to be broken off sufficiently low down. By this method of taking the "grass," no injury is done to the immature shoots or to the crown itself, and no butt-ends are left to decay on the plant. With a very little practice a man will go over a bed as quickly in this manner as with the Asparagus-knife.

**RIDGE CUCUMBERS.**—Seeds may now be sown singly in 1-inch flower-pots, placing them in a close frame on a mild bottom-heat. Afford air to the frame when the seeds germinate, gradually increasing the amount until the period arrives when they may be placed under handlights on the ridge or bed prepared for them. The latter may have as a base the stumps of Brussels Sprouts, &c., and enough partially-decayed stable manure and leaves as will produce a mild heat—say, a thickness of 2 feet. On these materials when the heat has risen, some rich soil should be placed in flat-topped heaps, at 5 feet apart.

**GHERKINS** for pickling should be grown in this manner, as also Gourds, especially the large-fruited varieties of the latter.

**FRUITS UNDER GLASS.**

*By W. POPE, Gardener, Highclere Castle, Newbury.*

**PEACHES.**—As soon as the fruits commence to colour, syringing must be discontinued. The fruits should be examined frequently, and each one gathered as soon as it will part easily from the foot-stalk. If they are gathered carefully, and laid on cotton-wool in a dry, airy room, they will keep for some days, and the flavour will be much superior to that of any that may be allowed to hang on the tree until dead-ripe. Fruits which are required for sending by rail should not be too soft, or with the most careful packing they will hardly be presentable at the end of a long journey. As soon as the fruits on successional trees commence their second swelling, any additional thinning that may be necessary should be done without delay. The shoots should also be tied in, so as to give the fruit as much sunlight and air as possible. Use every means to secure the trees free from insect pests before colouring commences, for then syringing must cease, and if insects are present they will rapidly increase. Let the trees be given sufficient root-waterings—manurial or otherwise—and supplement by light mulchings, to check excessive evaporation. Thin the fruits in later houses, and complete the disbudbing of the young growths, leaving no more than are requisite for next year's fruiting-wood and for extension. Any shoots beyond the fruit retained to attract the sap should be pinched to a few joints. Let the aim be to secure stout, short-jointed wood, by liberal treatment, and an abundance of light and air. Young newly-planted trees should be given attention in the matters of disbudbing and thinning the growths. Secure the shoots loosely to the walls or trellis as soon as they are long enough. Extra strong shoots may be pinched at the sixth or seventh leaf, which will tend to equalise growth, and encourage the weaker part of the tree.

**VINES: EARLY HOUSES.**—As the Grapes approach the ripening stage, a constant circulation of warm, moderately dry air should be allowed in the houses, leaving a little ventilation on at night as well as day. Muscats during the ripening process require a somewhat drier atmosphere than Hamburgs and some other black Grapes; and as they require rather a long time to finish properly, care must be taken that they do not suffer from lack of moisture at the roots, or they will be apt to shrivel. Where beds of fermenting material on outside borders have not yet been taken away, they should now be removed. Afterwards afford the borders a thick mulching of light strawy manure for a time. If found necessary, a good watering with tepid liquid-manure should be given before mulching. Muscats now in bloom should have a night temperature of 70°, with a corresponding rise in the day-time, and always with a circulation of air. Draw a dry, clean hand over each bunch about the middle of each day, to assist the setting.

## EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

## APPOINTMENTS FOR THE ENSUING WEEK.

SUNDAY,	MAY 10—	Brussels Orchidéenne Meet.
WEDNESDAY,	MAY 13	Roy. Bot. Soc. Summer Show, at Regent's Park.
FRIDAY,	MAY 15—	Roy. Bot. Soc. Lecture.

## SALES.

TUESDAY,	MAY 12	Special sale of flowering Orchids at Protheroe & Morris' Rooms.
		Sale of Stove and Greenhouse Plants at the Royal Gardens, Hampton Court, by Protheroe & Morris.
WEDNESDAY,	MAY 13	Unreserved sale of bedding and other plants at the Nurseries, High Road, Balham, by order of Messrs. Harwood Bros., by Protheroe & Morris.
FRIDAY,	MAY 15	Imported and Established Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—53.3°.

IN spite of the near approach of the Temple Show, which usually exerts a somewhat deterrent influence on the exhibitors at the fortnightly meeting of the Royal Horticultural Society next preceding, the Drill Hall on Tuesday last was full of exhibits and of spectators. Orchids, as usual, were to the fore, and there were luminous Roses from Canterbury, which were awarded the rare distinction of a gold medal, especially a box of "Captain Hayward," of a rich singularly translucent rosy-carmine, innumerable herbaceous plants and flowering shrubs, Tulips, both species and florists' forms, were largely represented, and it was curious to see from a drawing exhibited by Dr. MASTERS of a group of florists' Tulips of the early years of the century, how comparatively little modification has been effected in that favourite flower. The centre of the hall was occupied by a large and most interesting series of coloured drawings of Irises and their hybrids, exhibited by Mr. CAPARN. These were faithful representations, and so far from being exaggerated in colour, as such drawings too often are, these erred, if at all, in the direction of soberness of colouring.

Mr. BAKER's lecture on Tulips was devoted to the genus *Tulipa*, of which he sketched, in his usual comprehensive and masterly way, the geographical distribution and the morphological characters on which the arrangement into species is made. To show how necessary it is to study the species in cultivation, we may here allude to the remarkable observations of Mr. ELWES as to the changes exerted upon one species, *T. Kolpakowskyana*. As the matter is pertinent to the discussions now going on as to the effect of the "environment"

in effecting changes of this character, we reproduce the woodcuts (figs. 93, 94) showing the flower as imported and what it looked like after three years' cultivation. As to the limits of species, it is evident that the herbarium-botanist and the garden-botanist must arrive at rather different conclusions, and the "biologist" must perhaps act as umpire. It is interesting to draw a comparison between the comparative fixity as shown in the florist's Tulips, and in the drawing just mentioned, with the great range of variation which has been effected by a change in the "environment" after only three years. Mr. CAPARN followed Mr. BAKER with a few observations of a similar character on the genus *Iris*.

The meeting was attended by Professor ZACHARIAS, of Hamburg, the successor to the late Professor REICHENBACH in the direction of the Botanic Garden and in the Botanical Professorship of that city. The Professor attended the meeting of the Scientific Committee, and was the guest of the Horticultural Club in the evening. His main object in visiting the Society was to induce its members to exhibit next year at the forthcoming International Exhibition. The authorities of Hamburg undertake to convey exhibits free, and the prizes offered for Orchids and other plants are tempting to those who care for such rewards.

The International Horticultural Exhibition at Dresden is now in full swing. No report has as yet reached us, but we believe Messrs. SANDER & Co. are the only British exhibitors. Mr. ARTHUR TURNER is among the visitors.

At the Society of Arts on the previous Wednesday, our old friend, Mr. E. W. BADGER, read a very practical address on the subject of fruit-drying, a matter on which he has long taken great interest. We hope to give the substance of his remarks in a subsequent issue. It will be remembered that the trials at Chiswick were of a very satisfactory character. In the matters of spraying and of fruit-drying our American cousins are a long way ahead of us.

The current number of the *Agricultural Economist* contains a portrait and a sympathetic appreciation of the character and life-work of Mr. D. T. FISH.

The remarks we made last week on the flowering of Conifers has brought us other illustrations of interest, such as the young cone of the dwarf form of *Pinus Cembra*, which is curious as being lengthened instead of having the barrel-shaped cones of the type. From Mr. HARRIS, of Eastnor Castle, come magnificent specimens of the handsome *Abies bracteata*, showing the male flowers. This is one of the most distinct and handsome of Conifers, but we suspect it is not hardy. From Mr. CROUCHER, of Ochertyre Gardens, come specimens in cone of the curious *Saxe-Gothæa*. Messrs. BALCHIN and Mr. McHATTIE send specimens of the noble *Posoqueria macropus*, which is noticed in another column, as are numerous other specimens which do not need special comment.

The Coomber Testimonial Fund, which was originated to make some acknowledgment to Mr. WM. COOMBER on his retirement from the Superintendence of the Royal Botanic Gardens, Regent's Park, and of which Mr. HARRY J. VEITCH was Treasurer, and Mr. J. WILLARD, Secretary, has resulted in a cheque for £124 2s. 6d. being handed to Mr. COOMBER. It will afford satisfaction to many that the services to horticulture Mr. COOMBER has rendered have been so satisfactorily acknowledged.

**POSOQUERIA MACROPUS.**—The magnificent stove-shrub of which we give an illustration (fig. 91 from a specimen obligingly forwarded to us by Mr. McHATTIE, of The Gardens, Strathfieldsaye, is a native of Brazil. It was sent to us under the name of *P. longiflora*, but the characters afforded by the tube of the corolla and the base of the leaf are not those of the Guianan *longiflora*. They agree with those of *P. macropus*, recently figured in the *Botanical Magazine*, t. 7467, and to which Sir JOSEPH HOOKER refers the *P. multiflora* of LEMAIRE, in *Illustration Horticole* (1869), t. 597, a name of more recent date, and which must consequently be suppressed. The name *Posoqueria* is, it appears, derived from the Carib name, signifying poisonous. Whether it is so or not is doubtful. The plant belongs to the great order Rubiaceæ, and is allied to *Gardenia*, the mode of culture required for the one being suitable for the other. The plant was shown at the last meeting of the Royal Horticultural Society by Messrs. BALCHIN & SON, who obtained for it a First-class Certificate.

**THE SURVEYORS' INSTITUTION.**—The next ordinary general meeting will be held on Monday, May 11, when the adjourned discussion on the paper read by Mr. R. M. D. SANDERS (Fellow) at the meeting of November 25, 1895, entitled "Landlord and Tenant in Ireland," will be resumed. The chair to be taken at eight o'clock.

**MADRESFIELD COURT GARDENS.**—The President (Earl BEAUCHAMP), of the Worcestershire branch of the Gardeners' Royal Benevolent Institution, very kindly gave permission for his garden at Madresfield Court, to be thrown open to the public on April 30. A small charge having been made for an admission on behalf of the branch funds of the above-mentioned Institution, a sum of £15 8s. 6d. was taken at the gates. Unfortunately, the unpropitious weather considerably marred the attendance. The dressed flowerbeds were gay with bulbs, Aubrietias, Wallflowers, Alyssums, Silene, Myosotis, Polyanthus, Daisies, Veronicas, &c.; whilst the many thousands of bright Parrot and other Tulips, Narcissus, Muscari, Lily of the Valley, Primroses, Fritillarias, Scillas, &c., planted in the turf in bold groups, being in perfection, were greatly admired by the visitors. The various flowering shrubs such as Berberis, Lilac, Rhododendron, Prunus, and Genista, which are planted in large groups, were in remarkable beauty. It is not too much to hope that other presidents of branches will do likewise, and thus afford their neighbours an enjoyable outing whilst assisting a very worthy charity. *Correspondent.*

**ROSE SHOW FIXTURES IN 1896.**—We are indebted to Mr. ED. MAWLEY, Berkhamsted, for notice of the following additional Rose Show fixtures, viz., June 17 (Wednesday), York (three days); 18 (Thursday), Colchester and Isle of Wight (Ryde); 24 (Wednesday), Reading (National Rose Society); 25 (Thursday) Hereford; 27 (Saturday), Windsor; 30 (Tuesday), Maidstone and Sutton; July 1 (Wednesday), Croydon, Ealing, and Leatherhead; 2 (Thursday), Eltham and Norwich; 4 (Saturday), Crystal Palace (National Rose Society); 8 (Wednesday), Canterbury (Hospital Fête), Chelmsford, Hitchin, Lee (two days), Newcastle-on-Tyne (three days), Redhill (Reigate), and Tunbridge Wells; 9 (Thursday), Helensburgh; 15 (Wednesday), Ulverston (National Rose Society); 18 (Saturday), New Brighton; 21 (Tuesday), Tibshelf; August 5 (Wednesday), Chesterfield; 19 (Wednesday) Shrewsbury (two days). I am sorry, says Mr. MAWLEY, not to have been able to issue, as promised, a list of fixtures in April. Any dates not appearing in the present list I shall be glad to publish in the next one. I regret to announce that there will be no Rose Show held at Gloucester this year, owing to the small-pox epidemic prevailing there.

**ROYAL TRADESMAN.**—Mr. T. JANNOCH, Dersingham, Norfolk, Lily of the Valley grower to H.R.H. The Prince of WALES has been specially appointed florist to H.R.H. The Princess of WALES.

**THE FRENCH PLUM CROP OF 1895.**—Some curious facts are brought out in a recent report from

Bordeaux on the Plum crop in France during the year 1895, which, it is stated, was only half as large as that of the previous year, large fruit being very scarce, and the prices standing at double the figure of 1894. Exportations from Bordeaux were very restricted, and business in this article is considered to have been altogether unsatisfactory, California having an unusually

quantities of French Plums sent to those countries and to Canada consisted mostly of old fruit still held at Bordeaux from previous years.

**SPRING BEDDING AT THE QUEEN'S PARK, LONGTON, N. STAFFS.**—The simple massing of colours in flower-beds still has its admirers in certain

and an outermost edging of *Aubrietia purpurea*; these are showy beds. A bed is planted with *Tulip Potteri* (violet) on a groundwork of *Viola Bullion* (yellow), with an edging of white Daisies; another with *Duchess de Parma* Tulip, on a groundwork of *Myosotis sylvatica*, edged with yellow-flowered *Auriculas*. *Tulip Dussart* (scarlet), on a ground-

FIG. 92.—*POAQUERIA MACROPUS* (STOVE SHRUB): FLOWERS WHITE, FRAGRANT. (SEE P. 586.)

abundant crop of Plums, consisting mostly in large fruit. France was not only prevented from exporting to America, but dealers in Bordeaux had to witness the unprecedented fact of Californian Plums of excellent quality being sold in French markets at about half the price asked for the home produce. Germany and the United Kingdom also supplied themselves largely with these Californian Plums, and the limited

places, as the following contribution by a Staffordshire correspondent shows:—"The hedding-out at this comparatively new but well-kept park is at the present time very effective, and the enumeration of a few of the more prominent beds may be of interest to some of your readers. Three of the beds are filled with *Primrose Polyanthus* in mixed colours, edged with red and white double-flowered Daisies,

work of *Arabis alba*, and edged with red Daisies, filled another bed; as also *Tulip Chrysolora*, or *Myosotis sylvatica*, edged with white Daisies; and *Tulip La Reine* (white), on the new *Myosotis alpestris Victoria*, edged with yellow *Primroses*. These beds are very effective, and they are much admired. More than 10,000 *Wallflowers* are planted. *Hyacinths* are now over, but the beds

being carpeted with *Saxifraga Campositi*, are still presentable. Many of the beds are filled with *Auriculas* and *Aubrietias*, and in one part of the park there are beds filled with late double-flowered *Tulips*, such as *La Candeur*, Duke of York, *Rex rubrorum*, on a groundwork of *Myosotis* or *Arabis*, according to the colour of the flowers of the hulbs, and these will carry on the display till the summer bedding-plants are put out. *Violas* of the best varieties are extensively grown as edgings to borders, &c., and give every satisfaction, *V. Bullion* being one that is much prized as an early and continuous bloomer."

**DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.**—On the occasion of the meeting of the Floral Committee, on April 11, 1896, the committee awarded First-class Certificates to Mr. C. G. VAN TUBERGEN, Jun., of Haarlem, for *Arum palæstinum* Eggeri, and *Erythronium Johnsoni*; to Messrs. E. H. KRELAË & SON, of Haarlem, for *Fritillaria aurea Bornmulleri*. An Award of Merit was made to Messrs. E. H. KRELAË & SON, for *Allium nov. spec.*; and an Honourable Mention to Messrs. E. H. KRELAË & SON, for a collection of varieties from *Anemone fulgens* and *Anemone blanda*, *Fritillaria latifolia*, and *Helleborus*.

**FRUIT FROM TASMANIA, ETC.**—The P. and O. Company's steamer *Rome* arrived at the Albert Dock, London, on the 2nd inst., having on board 10,568 cases of Apples from Hobart, 1650 from Melbourne, and 120 from Adelaide. It is worthy of note that the improvement noticed in last year's consignments seems characteristic of this year's imports, some fine specimens of Ribstons and Pearmain's being on sale at prices which must certainly be remunerative; they are fetching twice as much money as could be obtained a few years since for the unsorted, irregular fruit, then thought good enough for the English market.

**A POISONOUS ORCHID.**—*Cypripedium spectabile*, a comparatively common Orchid, is mentioned by M. D. E. MACDONALD as possessing decidedly poisonous properties. These, says the *Revue Scientifique*, are located in the leaves and stems, and recognisable as producing a special cutaneous irritation on those who incautiously handle the Orchid, an irritation similar to that excited by Rhus. The substance causing these results is an oily matter secreted by the glandular hairs. This matter is found, as in the Chinese Primrose, between the cell-wall and the cuticle of the terminal cell of the glandular hair, and is liberated by the rupture of the cuticle. This poisonous substance appears to serve as a protection to the reproductive organs of the plant, as the action and secretion of the poison are augmented in proportion to the development of the plant, and attain their maximum during the formation of the seed.

**THE ROYAL BOTANIC.**—We are requested to publish the following letter:—"For the first time for between forty and fifty years the firm of PAUL of Chestnut will be absent with their exhibits from the Royal Botanic Society's Summer Show. Messrs. PAUL & SOX have refused to exhibit on account of the prizes awarded to them and other exhibitors, many of them gardeners, who have to pay their own expenses, the prize money not having been paid. Communications on the subject are treated by the officials of the society as hardly worthy of a reply."

**EXTENSIVE EXHIBITION AT CARDIFF.**—On Saturday last, the 2nd inst., the largest exhibition that has ever been held in Wales was opened in Cardiff by the Mayor, Lord WINDSOR, who is also President of the Exhibition. Briefly, the Exhibition is comprised of the following sections, each of which is managed by a separate committee:—1, Fine Arts and Antiquities; 2, Mining and Mining Appliances; 3, Machinery, Electricity, and Local and General Industries; 4, Maritime; 5, Agriculture and Horticulture; 6, Health; 7, Scientific Instruments; 8, Books and Manuscripts; 9, Photography; 10, Sports, Pastimes, and Amateur Exhibits. The Horticultural Committee includes many names well known to

our readers, such as J. MUIR, A. PETTIGREW, W. W. PETTIGREW, STEPHEN TRESSEDER, RALPH CROSSLING, &c. The whole buildings have been erected, and the shows will be held in Cathays Park, a private park in the centre of the town belonging to the Marquis of BUTE, who has lent the ground for the purpose of the exhibition. The enterprise is of considerable magnitude, and is a further testimony to the importance of the town and to the energy of its inhabitants. It is calculated that, to make it a financial success, the exhibition must be visited by 4,000 paying persons daily. Cardiff and its suburbs comprise about 180,000 souls, and there is an immense population on what is locally known as "the hills" engaged in the mining industry. The more entertaining and amusing features of the exhibition include the Bombardment of Santiago, a bicycle railway and cycling-track, Indian bazaar, Welsh fair, panorama, switch-back, concert-hall, a representation of SHAKESPEARE'S house, of a Dutch house, and various other minor items. The opening ceremony was a distinct success, and it is estimated that it was witnessed by 10,000 visitors.

## BOOK NOTICE.

**THE BAMBOO GARDEN.** By A. B. Freeman-Mitford, C.B. (London: Macmillan & Co.)

THE hardy Bamboos, even in their entirety, are but a small item in the great host of hardy trees and shrubs which modern enterprise and skill have brought to the gardener's hand. Their grace and beauty, however, are so striking, and their distinctness from the rest of the cool temperate flora so apparent, that they well deserve the honour that has now been paid to them in the shape of a volume all to themselves. Although these plants are almost certain to soon become common garden plants in the southern and warmer parts of these islands, the great bulk of them have only been introduced within the last few years, and it is to the author of this book, who by his pen, and by illustrating so happily in his own garden their suitability to our climate, that much of the prominence they have latterly attained is due. To no one, therefore could the task of writing a book on hardy Bamboos so worthily have fallen.

It has well been said that he who does a little thing perfectly is worthy of more admiration and praise than one who attempts the bigger thing, and ends by only doing it indifferently. That is the thought that occurs to us after looking through *The Bamboo Garden*, although the author probably would demur from the statement that the elucidation of the hardy Bamboos was a small undertaking. It is, indeed, certain that there are few groups of plants so small as this which would demand such long, careful, and minute observation, before a full and accurate account of them, as this volume supplies, could be given.

The book opens with a chapter dealing chiefly with the interesting phenomena attendant on the flowering of many Bamboos. It is well known, and has been recorded in various quarters of the globe, that the whole of a species—extending, it may be, over many miles of country—will burst simultaneously into flower, no matter how different the conditions may have been under which individual plants had existed. It has hitherto been commonly accepted that such plants after flowering die, and are replenished by means of the seed they so plentifully produce; but Mr. Mitford is of opinion "that the older botanists and travellers came to rather hasty conclusions on this matter;" and the evidence he produces supports the view that although the plants die to the ground and suffer greatly from exhaustion, they rarely, if ever, perish outright.

How exhaustively Mr. Mitford has studied his subject, as well as the amplitude of his research, is shown by the chapter dealing with the uses of Bamboos, and the superstitions connected with them, as well as by that dealing with etymology, classification, and characteristics. The bulk of the volume, however, is occupied with the description, nomenclature,

and history of the hardy species found in our gardens. It is this portion which will give the book its chief value in the hands of the cultivator, and which, in spite of the disclaimer of its author, invests it with a true scientific importance. Every species known at the present date to be hardy and in cultivation is described with a fullness and detail which could only be furnished by one who has watched and studied living plants. Nor is the important matter of cultivation dealt with in a cursory manner. This is of the greater consequence, because an ignorance of the peculiar requirements of Bamboos, and especially of the treatment of newly-imported plants, and the proper time for transplanting, has resulted in the loss or serious crippling of many Bamboos in recent years. Late spring is undoubtedly the best time to transplant, late autumn the worst; but we have been informed by a nurseryman who deals (more largely, perhaps, than any other in England) in these plants, that it is difficult to get people to order them, except at the latter season, frequent disappointment being, of course, the result. This, and similar pitfalls, the student of Mr. Mitford's book will happily escape. A useful list is also given of the native names of the Japanese species, with their European equivalents. A want of knowledge in this matter has led several cultivators to obtain from Japan species of which they had already sufficient, or which were easily obtainable in England.

Under the heading of *Apologia pro Bambusis meis*, Mr. Mitford closes his book with a delightful chapter. Its literary charm will appeal to any one who loves a garden or a book—it need not matter if he never saw a Bamboo. It seems there exist in these *fin de siècle* days people who object to the presence of any foreign tree in our English landscape. They dignify themselves with the name of "purists," although it is certain a more appropriate, if less complimentary, title might easily be applied to them. Anyone who would dispossess our parks and woodlands of the Horse-Chestnut—their crowning glory in these fragrant days of May—because it comes from the mountains of Greece, is scarcely worth the powder and shot with which he is here so easily demolished. But the process leads up to a charming word-picture of the author's own garden in winter time: "As I write, I look out upon a great rolling tract of park-land, studded with patriarchal Oaks that were saplings in Plantagenet and Tudor days; giant Ash-trees, Elms and Thorns, planted in the days of good Queen Anne. It is thoroughly English, and perfect of its kind; no impious hand should dare to tamper with it. But, farther up the hill, there is a spot smugly screened from the cruel blasts which come from north and east, where, when the great Oaks and Elms, shorn of their summer bravery, are mere gaunt skeletons, there is still some shelter and some warmth. Here, amid the sparkling glitter of a Holly-grove, are all manner of beautiful Evergreens—rare Pines, steeping Fir-trees, Rhododendrons, Cypresses, Junipers. A tiny rill trickles over the green velvet of the rocks, with Ferns peeping out of crannies, in which many an alpine treasure is hushed to rest, waiting the warm kiss of spring, and the song of the birds, that, like Orpheus with his lute, shall raise the seeming-dead from the grave. Tall rushes, and gracefully-arching Bamboos, hardly stirred by the wind, nod their plumes over the little stream from which the rays of a December sun have just strength enough to charm the diamonds and rubies and sapphires; a golden pheasant, all unconscious of a human presence, is preening his radiant feathers by the water-side. It is a retreat such as the fairies might haunt, and where in the bitter Christmastide a man may forget the outside world, and for one brief hour revel in a mid-winter's day-dream of glorious summer. In the planning of this sun-trap, surely the most captious critic will not cavil at the addition of such strangers as may seem best suited to fill in a scene which may not be English, and yet is in harmony with, and lends a new charm to, the surroundings with which it is contrasted."

With so much to be grateful for in this dainty little volume, it may seem ungracious to suggest that

there is room for improvement, yet we scarcely think the drawings by Mr. Alfred Parsons—clever as they may be from the artist's standpoint—serve any practical purpose so far as the illustration of the text is concerned. They are altogether too "impressionist" to help the bewildered novice to the determination of his plants. The picture of *Arundinaria nitida*—a Bamboo of very distinct and characteristic habit—is valueless as a portrait; and in the case of the drawing of *Bambusa Laydekeri*, it would be by no means difficult to select a more fitting legend. Mere portraiture, however, was probably not the artist's aim. In any case it is a small matter, and we heartily recommend this book, not only to those who cultivate the particular class of plants with which it deals—it ought to be indispensable to them, but to all who love a garden.

THE DESTRUCTION OF INSECTS ON FRUIT-TREES.

THE present month should see all cultivators of fruits busy with the destruction of their chief foes, the insects which infest the trees, whether growing on walls and fences, out in the open quarters, or in orchards. The days of letting these matters depend on Providence and regarding them as unavoidable accidents are gone, and soon we shall have the State insisting upon a systematic war being waged by all owners and cultivators against the common enemy. Let us take the important Apple first, examining the trees which we will suppose received a winter-dressing of some kind to eradicate the *Aphis lanigera*, *alias* American blight, woolly aphid, &c. Strong remedies are, at the present season, out of the question, and if it be observed that some of the aphides have survived the winter scarifying and brushing with petroleum, brine, soap-suds, or whale-oil, the garden-engine should be brought into use, and the pests washed off the branches. If this can be followed up for a week, the greater number will die of starvation, as they cannot for long periods of time be deprived of their milch-cow, the Apple-tree.

An ever-present enemy at this season is the Apple aphid (*A. mali*), infesting the leaves in enormous numbers, and which, if left in possession, destroy the foliage, and thus cripple the growth of the tree, and hinder the development of the fruit. As against this pernicious aphid, quassia-water, say, at the rate of 2 oz. quassia-chips, should be boiled in a bag in 1 gallon of water for a quarter-of-an-hour, and whilst it is hot, 2 or 3 oz. of soft-soap should be incorporated with it. This should be used cold. It may require several applications to rid the trees of the successive colonies of the aphid. Strong tobacco-water, such as is obtainable from the tobacco manufacturers, is also an efficacious remedy. It should be mixed with two-thirds or more water, according to its strength, and to render it somewhat sticky, soft-soap should be mixed with it.

The codlin-moth (*Carpocapsa pomonella*), is at this season industriously engaged in laying an egg in the eye of the Apple, and if these eggs, or the maggots which spring from them, are left undisturbed, there is sure to be a great loss of fruit, for the maggot bores a channel from the eye to the side or base of the fruit, which either soon falls to the ground, or hangs on the tree to be prematurely ripened.

Some observers say that the grub or maggot stays in the fruit and turns into a chrysalis therein, and then to the perfect moth ready to begin the process over again, and this may be true of very early hatchlings; but as a rule the maggot, after eating its way through the fruit, falls to the ground, and completes its transformation there. It is certain that most of them do so, hence the good which follows from dressing the land under Apple-trees with quicklime, pricking over the surface and turning-in pigs, fowls, ducks, &c., and fixing grease bands round the stems to prevent the ascent of the caterpillars, as is done in the case of the winter-moth, whose females are unable to fly, but who crawl up the stems of the Apple-trees. The caterpillar is about half an inch in length, fur-

nished with a few hairs, and a black or brown head, and dark-coloured marking on the ring next to the latter, and eight dots on the others. The moth is about three-quarters of an inch in the spread of the fore-wings, which are ashen-grey or brown, with streaks and markings of a dark colour. There is at the hinder corner a large brownish spot, and a coppery-coloured ring around it. If the attack is slight, a gentle shake will bring the maggoty fruits to the ground, when they should be carefully collected forthwith, and burned. As a remedy to apply to the tree use Paris Green at the rate of 1 lb. and 1 lb. of lime to 250 gallons of water. The Americans, who use this formula largely, say that lime should be used at this strength up to July 1, after which date one pound of quicklime should be used to neutralise the free acid; in fact, lime should always be

harm at times, devouring the foliage wholesale. The silken cocoons found in the trees should be destroyed. These can be found in July, and should be cut off, shoots and all, with nippers, one person cutting, and another holding a pail to catch the web and the caterpillar, which, on the first alarm, throw themselves down by their threads. It is very troublesome in orchards under long grass.

The small Ermine Apple-moth (*Yponomea padella*), whose caterpillars come out from under a patch of gum on the shoots, where they have lain all the winter, devour the leaves wholesale, and then spin a web. When full fed, they spin a light cocoon in the midst of their webs, and turn to a chrysalis. The moth appears at the end of June. The remedy is the same as with the Lackey-moth. Miss Ormerod recommends fish-oil soap, but we think that Paris Green washes would be more effectual against the caterpillar of this species, and its use would involve less labour. In the cider-growing districts the Apple-blossom weevil, *Anthrenomona pomorum*, in backward seasons, is very destructive, attacking the flower-buds just previous to their expanding, and, as in the case of the Collin-moth, one egg is laid in each flower-bud. This the female does by boring a hole in the bud with her proboscis and laying the egg within the hole thus made, closing the hole with her proboscis. It is now rather late for watching this proceeding, but in late districts, where egg-laying is postponed to May, the cultivator may catch many of the weevils engaged in it by quietly spreading cloths beneath the trees, and then shaking the trees, when they will fall on to the cloths, and can then be collected. As the weevils hide in rubbish and rough useless bark, these should be cleared away in the winter so as to afford as few hiding places as possible. A grease band is of service, as but few of the females can fly. The Cherry aphid, black-fly, *A. cerasi*, can be got rid of by the use of Paris Green; or in the case of wall trees, by dipping the infested ends of the shoots in strong tobacco water, or fumigating the trees with a sheet securely fastened to the wall to keep in the tobacco smoke.

The Pear has a host of enemies, one of the worst of which is the Pear-sucker, *Psylla pyri*, a small four-legged fly that is injurious to the plant by sucking the sap in the shoots and covering the leaves with excrement. The eggs are laid at about the time that the Pear comes into bloom, on the undersides of the leaves, and on the parts of the flowers that are furnished with woolly hairs. The larvæ hatch in about ten or twelve days, and they are yellowish, lighter on the abdomen; the head has a whitish horn, and they have six legs. In the next stage they resemble small bugs, crawling about the shoots and sucking the juices. When the pupa is fully matured, it attaches itself to a leaf, the outer skin cracks, and the perfect insect emerges, leaving the pupa-skin sticking to the leaf. Hitherto, any certain means for the destruction of this insect has been wanting, but it is now discovered for the killing of insects which suck, that the following formula is very effective:—Soft-soap, 1 quart; petroleum, 1 pint; water, 8 to 12 quarts. The soap should be warmed till it liquifies, then taken away from the fire, and the petroleum added, be stirred or agitated forcibly with a powerful syringe, until it becomes a creamy liquid; dilute with water till the petroleum be one-fifteenth to one-twenty-fifth of the whole. It must be kept well agitated whilst being used. This would also be a good remedy to use against aphid of any species.

The saw-fly of the Gooseberry and Currant is amenable to hand-picking and dusting with hell-bore-powder only at this season, although much may be done in the winter to mitigate the evil by removing the soil from beneath infested bushes, and replacing it with clean soil from another part of the garden, and by dressings of lime.

The Currant-bud mite, so destructive in some districts, can only be dealt with so far as our present knowledge goes, by cutting off all affected shoots and burning them without delay. The aphid of the Plum can be destroyed either with soft-soap, petroleum-washes, or tobacco-water, and even powerful syringings will do much to clear the trees of this species, the same being carried out late in the autumn, to prevent the laying of eggs.

FIG. 93.—TULIPA KOLAROWSKYANA: AS IMPORTED. (SEE P. 586.)

used when Paris Green is applied as a spray to any kinds of fruit. For this reason it is advisable to mix Bordeaux Mixture and the Paris Green mixture together, as then all caustic action is prevented.

The Winter-moth (*Cheimatobia brumata*) is one of the worst enemies of the Apple. Of course, prevention is better than cure, and the cultivator should place grease-bands on his trees early in October, to prevent the females gaining access to the trees; but supposing that this was not done, then the best remedy is spraying the trees as soon as they are out of bloom, with Paris Green, and repeating the spraying twice in June. Other remedies, such as shaking the trees and collecting the caterpillars that fall, or smashing them, turning up the soil and dressing it with quicklime are only palliatives; of course, the careful cultivator will collect all prunings in the winter and burn them.

The rings of eggs of the Lackey-moth (*Bombyx neustria*) should be carefully looked for and destroyed. The caterpillars of this species do a great deal of

## HOME CORRESPONDENCE.

**APPLE-BLOSSOMS IN EAST ANGLIA AND ABOUT EDINBURGH.**—While waiting for the opening of Apple blossoms in East Anglia on May-day, and through the first week of May, it was rather startling to hear from an old horticultural friend a week ago that Apples were in full bloom in and about Edinburgh. We all know that height tells for a good deal on such phenomena, as well as latitude; but few will be prepared to learn that Edinburgh had outrun Norfolk and Suffolk in the race for the first opened Apple blossoms. Possibly our extension of time in East Anglia arises from our greater uniformity of level. The monotony and flatness of surface may indeed make the blossoming, as well as the harvesting, later as well as more uniform. Thus, possibly the Apple trees in bloom in or around Edinburgh on the last days of April may have been but the advanced scouts, posted on sunny sites, of the advancing hosts of blossoms hurrying forward as their cooler environments enabled them to flush and flood orchards and gardens with their matchless blends of pink and white. Be that as it may, in all mountainous countries we have longer seasons of blossoming and of ripening, and astonishing variations of season and wide diversity of both, sometimes within comparatively narrow geographical limits. Many years ago I was much struck with these differences on the two banks of the Clyde, from Glasgow to Lanark. The state of the bloom as well as fertility were marked, and rose with the warm banks and sunny sides, and fell with the cool or shady shore. And it is also so with other river banks and coast lines. While every hill and mountain modifies climate by its altitude, it also cuts it up into local fragments in the ratio of its sunny or shady sides. On the whole, perhaps horticulture is the gainer in the long run, through the infinite number and variety of those disturbing forces which we conveniently speak and write of as local climate. *D. T. F.*

**LATE-BLOOMING APPLES.**—Is not that what is ordinarily termed a pious opinion given expression to by "Pyrus Malus," when he remarks of the new Apples he looks for, "the variety should bloom late." We have in Court Pendu Plat a variety that always blooms late. I noticed the other day, when looking over the extensive collection of Apple-trees at Maiden Erlegh, Reading, that whilst almost every variety was in full bloom, the exception, Court Pendu Plat, was fully a fortnight later. Now we want to know whether this latter variety is on the average a more constant fruiter, or a better one, than the greater portion of those earlier-blooming varieties that do flower so much sooner. The date of my visit was May 1, and though dry, the air was very cold. Still, so far as I could learn, no harm had been done by frost. Is there any more certainty that sharp white frosts will yet come during the middle of May than during its early days? But after all, has there not been ample experience of this one late variety for many years, and has not that experience shown that it has no claim to be regarded as more prolific than any other early-blooming variety? In reality we need early-blooming Apples in this country to enable the fruits to have a long season in which to swell and mature. Then we are told the bloom should have leaf protection. If Apple-bloom was not developed and well set before leafage became too luxuriant, and it must be so to give the bloom the protection asked for, the setting of the bloom would be materially hindered. It is a wise provision of fruit nature that the bloom which is to produce the fruit should have precedence of the foliage so as to be able fully to utilise what of sap fruit nature had placed at its disposal, and thus the present arrangement of trees and bushes in full bloom ere leafage is abundant is best. I entirely agree with "Pyrus Malus" when he demands that in fruit culture the needs of the masses should be catered for. I have always pleaded for that view, and to that end I must use the best varieties for the purpose we have. The ideal fruits so much wished for will not come for a few generations. *A. D.*

**THE ROYAL HORTICULTURAL SOCIETY'S CODE OF JUDGING.**—Your correspondent, "H. L." seems somewhat disappointed that neither he nor other critics have been able to draw members of the Code of Judging Committee into a discussion respecting the merits of various points in the published code. No doubt it is to some an amusing occupation to poke a dog with a long stick, in the hope of arousing his anger; but if the animal is dignified and cool of temper, he

refuses to be drawn. It is very much so with the members of the committee. They have, however, other reasons for reticence. In the first place, what of criticism so far has been published, though worthy of all attention, has been of a theoretical order, seeing that since the issue of the code few or no flower-shows have been held to enable the principles of the code to be utilised. Naturally it was wise to await such results, and the autumn may be expected to furnish numerous critics, who have had practical experience of the code in its application to judging. Then there was an implied understanding on the part of the members of the committee that in due course they should be again called together to consider criticisms, and utilise good suggestions, with a view of making such of service in any future edition. But it is evident that the time for the publication of a second edition is not yet. We need ample opportunity to enable the code to be tested. No amount of criticism or discussion can alter the existing code, but many changes may be found needful in a new edition, or perhaps few. In any case, I must ask "H. L." and others who are impatient, to patiently wait. They must not forget that such a code never before had existence in relation to horticulture; and if imperfect, at least it does offer an admirable foundation for perfection. *A. D.*

**FRUIT PROSPECTS.**—There is in this garden and district every probability of as good a crop of fruit this year as last, should mild weather prevail. Apricot trees are exceptionally promising, and the fruits are fast swelling up. Pears, too, are a heavy crop, and in this garden the blossoms of nearly all the varieties grown are set. The Damsen, a much-planted kind in the county, promises to be very abundant. The blossoms of the Strawberry are already showing in great numbers. *Geo. Burrows, Berwick Gardens, Shrewsbury, April 27.*

**MULCHING AND WATERING WALL TREES.**—These simple but important operations ensure good crops, fine fruit, and well-conditioned trees, and where they have not as yet received attention, no time should be lost in pricking up the soil of the borders, placing thereon a layer about 3 inches thick of half rotted dung, and affording a thorough watering. These thorough waterings of the soil about the roots of the trees should be several times afforded during active growth, and if applications of liquid-manure can be sometimes afforded, all the better, especially to Apricot, Peach, and Nectarine trees. In some gardens the wall trees receive but little attention in the matter of watering the borders, and to this fact is to be attributed the starved and barren condition of a large percentage of the wall trees in this country, albeit in the majority of cases the cause is put down to a bad soil and our indifferent climate. The making up of one's mind to do the work forthwith at the right time is of far more consequence than the fact of considering whether there is time in which to do it, the first will make the latter easy of accomplishment. *H. W. H.*

**THE "BOLTING" OF CABBAGES.**—In the gardens around Maidstone there are general complaints about Cabbages bolting, and in some cases entire plantations of certain varieties have failed to heart. I have several varieties growing side by side, and the best of them are Ellam's, of which scarcely a plant has run; Veitch's Main Crop, a very good Cabbage, of which, out of a large number, only some half-a-dozen have bolted; and Mein's No. 1 is turning in well, these three varieties being far ahead of any other grown at Mereworth. The Nonpareil, Early Enfield, and Battersea have bolted to the greatest extent, although the plants were treated all alike, and looked well till the time for hearting came round; and whether the dry autumn has caused the bolting, I cannot form an opinion—but from two sowings and plantings, all of the last-named trio have run up for flower. *H. Markham, Mereworth, Maidstone.*

**GOLD-LACED POLYANTHUS.**—In the current correspondence in the *Gardeners' Chronicle*, re Gold-Laced Polyanthus, I am much interested, and quite agree with "R. D." that a Priuula Society, calling itself National, should not omit these old-fashioned beauties, and the fact that they are not well presented at the shows, should, of itself, not be sufficient reason for excluding them from the schedule. The proper course would be for the judges to withhold the prizes if not deemed of sufficient merit. It is well known that they are difficult to manage in the South Midlands and the North, but the difficulties are surmountable, and I have at the present moment a grand plant of

George IV. with half-a-dozen trusses on it. I have grown the breed for many years, solely for love of the flowers, and for fear that some of them should be lost, for it is a pity, and perhaps a disgrace, too, for the florists of to-day to admit that they cannot grow or raise flowers equal to those grown of old. When we look at the lovely illustrations of Pearson's Alexander and Kingfisher, and then know that these sorts are lost, and that there is nothing as good to take their places, it behoves a National Society to encourage the cultivation of them. Mr. Douglas, surely, is mistaken when he says that the varieties which were in existence sixty years ago are still exhibited at Newcastle-on-Tyne. The last Alexander was in the hands of the Rev. Whitehouse, and he promised to let me have a plant, but lost it some fifteen years ago. I agree with Mr. Douglas's statement that there are only a few good sorts, and if societies continue to disregard them, their number is likely to become less. These old flowers take one back in imagination a long way, and the interest which attaches to them is like that which causes us to find something to admire in ancient buildings and antiquated customs, which I for one should be sorry to see entirely lost. *J. P.*

**KELWAY'S MODEL CINERARIA.**—It may interest Mr. Harrow to know that I have a plant here of "Kelway's Model Cineraria" strain, with a head of bloom 7 feet 8 inches in circumference, a dense and brilliant mass of flowers. I counted over 600 open flowers on this plant at one time. I have had several specimens out of fifty-five plants which measured 24 feet, with blooms up to 34 inches in diameter. *Thomas Wager, Gardener, Hill Grove, Mardy, Abergareenny.*

**A VALUABLE PALM, SO-CALLED.**—It is stated on the authority of *Modern Society*, that Miss Helen Gould, the gentle maiden-millionaire, who takes a great pride in her conservatories, "has just committed a little piece of personal extravagance in the purchase of a very rare Palm, for which she paid the sum of £7,000. This Palm is a magnificent specimen of *Ravanola nudagarvieni*!" (*Ravanola madagascariensis*), "and stands a little over 32 feet high, while it is nearly 100 years old." This species will be known to some under the name of *Urania speciosa*. It may not be generally known that the French term this Palm "the travellers' tree," probably on account of the water which is stored up in the large cup-like sheaths of the leaf-stalks, and with which travellers are said to allay their thirst. The leaves are of gigantic size, somewhat like those of *Musa Ensete*, but arranged in two rows on opposite sides of the arboreal stem. [The plant is nearer to *Musa* than to *Palms*. *ED.*]

**FLOWERS OF CONIFERS.**—Your interesting leader on these, recalls my first experience with those of *Picea Pinsapo*; from that day, many years ago, I have never failed to recommend the flowers of this and other species for their beauty of structure and colouring. The colour is brilliant, and as the habit is specially compact and floriferous, the small flowers make the semi-glaucous-leaved branchlets glow with brightness. The *Pinsapo* Fir also blooms freely at an earlier period than most other Conifers. *D. T. F.*

**NECTARIES ON THE CARPELS OF CALTHA PALUSTRIS.**—Last year, about this time, I called attention in your columns to the fact that I could not, after most careful study, observe anything on the carpels of *Caltha palustris* at all like the process represented by Müller in his work on *The Fertilisation of Flowers*. Professor Henslow was good enough to record his experience in your issue of June 1, 1895, and it practically coincided with mine. He, in his communication suggested that if the following period were prolonged in Germany there would be more insect visitors, and this would be quite in keeping with a correspondingly well developed honey-secreting system. Of course, Müller's illustration would be drawn from German flowers. I have this season procured flowers of *Caltha palustris* from Germany, and aided by a much more expert microscopist than I am, Mr. John Ballantyne, of Rothesay, have failed to discover anything in the way of a well-developed honey-gland. The superficial tissue at the base of each carpel is in two places peculiarly developed, and through it seems to exude, in very minute drops, nectar or honey. This is observed in flowers grown in this neighbourhood, and to about the same extent in those grown in the South of England, but to a greater extent in flowers grown in Germany; only it never assumed, in the large number of flowers we examined, anything like the figure in

Müller's book. I sent some of the German flowers to Professor Henslow for his inspection, and the following extract from his letter acknowledging them will be interesting:—"I am very much obliged to you for sending me the specimen of *Caltha*. The embryonic and slightly-papillate tissue on the sides is much the same as in our English ones; so I begin to think Müller must have 'exaggerated' the point a little!" *William Cuthbertson, Rothsay.*

**FEEDING ASPARAGUS.**—Permit me to back up Mr. Wythes' most sensible caution in last week's *Gardeners' Chronicle*, against over-feeding and salting at the wrong time. My first experience in Asparagus growing on my own account was peculiar. The proprietor had his notions in regard to this kind of vegetables. The first was that it could not be overfed, the second that it could not be oversalted, especially when at rest. In pursuit of both theories this

the whole of the plants and soil had, as soon as practicable, to be removed, and a new start made. And from those early days until now, I have never had an object-lesson of a more instructive nature on the matters of manuring and salting Asparagus-beds. Two other lessons were also speedily learned in Asparagus-culture: the first was, never to plant this vegetable in the open in a dormant state; and the other is, never to plant on raised beds unless on very low or wet land. Alike at Ely, Colchester, in Cambridgeshire and in Lincoln, good Asparagus is grown on raised beds, on fen-land, near the water-level. But on good soils, a yard or two or more above the water-line, better Asparagus can be grown with less labour and expense on the flat than on raised rows or beds. Growers also will generally endorse Mr. Wythes' recommendation of frequent deluges of liquid-manure. As to common salt, affording it in small quantities and often to crowns during the season

acute angle. Now take your scion, and with two clean cuts shape its base so as to fit accurately the cleft at the branch, taking care that the edge of the barks of the stock and scion accurately coincide, for reasons before stated." &c. Well, I know how to cleft-graft, and many other methods, but were I to stand up and explain myself as above, I wonder how many would grasp my meaning? Such instruction as is here used would baffle rather than teach, and anyone that could understand "Experience" would be already a master of the art of grafting. I consider myself fairly well up in such matters, but confess I had to read it over several times to make sure I was not about to learn a new way of uniting stock and scion (for grafting, after all, is only a unity of barks), and the way to teach this simple work is to use plain words—at least, such is my experience; and as to cleft-grafting, I consider it the most objectionable of all methods. Saddle, rind, or whip-and-tongue grafting are preferable, and will meet the case, let the stock be of what size it may. The reason I write this is, that any one teaching those who do not know, should use the plainest and most simple language, so that he may be quite sure the teacher is understood. *Charles Itoll, Technical Lecturer in Horticulture.*

**BITTER ORANGES.**—The naturalist Galesio was the first to trace the history of the Orange, and the result of his careful researches he published in 1811 at Paris. According to this author the Arabs penetrating further into the interior of India than any foreign nation had done before, discovered the Orange family flourishing there, and held in high esteem by the natives. From this point the Arabs conveyed the sweet Orange into Persia and Syria, and the bitter Orange, now called the Seville, found its way into Arabia, Egypt, the North of Africa and Spain. From these points the Orange travelled into other countries, notably China, and in this latter empire it so flourished and spread, that by-and-by it came to be a fiction, believed in by Europeans, that the Orange was indigenous to China. Galesio shows, however, that the so-called "China Orange" is by no means a spontaneous production of that country, and his statement is further corroborated by the absence of all mention of this fruit in the exceedingly minute and circumstantial account given by Marco Polo of the productions of China. The sweet Orange which the Arabs carried to Spain spread thence into Portugal, Sicily, St. Michael, the Mediterranean Islands, and the West Indies. In each and all of these various places has the difference in climate and soil produced varieties and changes in the characteristics of the original common stock. On the banks of the Rio Cedeno, in the midst of a great forest, Humboldt, to his amazement, came upon a broad belt of wild Orange-trees laden with large, sweet, and most delicious fruit. "Surely, these must then be indigenous to the soil," he thought; but subsequent inquiry led to the discovery that these grand old trees had once formed a portion of extensive groves planted by the Indians from seeds obtained from their early Spanish visitors and conquerors. And to this same source does Florida owe her beautiful groves; only there, whether by the accident of soil or seed, the wild fruit is sour, not sweet. I am indebted for the above information to *Florida Fruits*, published in Louisville, U.S.A. W. Roupell, Harvey Lodge, Roupell Park, S.W.

FIG. 94.—TULIPA KOLPAKOWSKYANA: AFTER THREE YEARS' CULTIVATION.

(SEE P. 586.)

gentleman took advantage of a change of gardeners to carry out his ideas to the letter. In pursuit of this object he lifted his old beds and formed new ones, chiefly of the richest, rankest manures that could be carted from his piggeries, cowsheds, and bullock-yards. The plants were carefully planted on these rank dunghills of nastiness and rottenness, which extended to over a yard in depth. So soon as all were planted, the beds were heavily top-dressed with salt. I did not see them till April 1, and shortly before this date they had a second dressing of 3 inches thick of salt. As I neared the beds I fancied there had been a heavy local fall of snow. It need hardly be added that the treatment killed most of the grass, and crippled all that escaped with their life. Efforts were at once made to scrape and sweep off as much of the salt as possible; but the mischief had already been done, and the roots and crowns, already semi-paralysed by the tremendous dressings of salt, were made worse by contact with the rank manure, while the cold and the moisture which carried down the salt to the roots, rendered recovery hopeless, and

of growth is the safest and most successful practice. Salt is most indispensable, and I saw some splendid beds last year, said to be fifty years old, which, I was told, have had no salt applied to them during that long period of time. If you or your readers would care to have the practice that resulted in such plentiful and permanent results, I shall be pleased to give it on a future occasion. *D. T. F.*

**TEACHING THE ART OF GRAFTING.**—I, like "Experience," lecture on horticulture, but I fear that I for one should have to "button-hole" him, as it appears his audiences do at times, especially in the matter of grafting—see p. 552, on cleft grafting, where he instructs us to "take a fine-tooth saw, cut through the branch at its axis, and finish off smoothly with a knife, then proceed to cleft-graft. To do this, a piece of wood should be removed, by two diagonal cuts, forming an acute triangular incision, being careful to cut the bark cleanly, and not to bruise it; this cleft being for an ordinary branch, half an inch deep at its base, diminishing to a point at the opposite

## SOCIETIES.

### ROYAL HORTICULTURAL.

MAY 5.—Those who had expected a paucity of exhibits at the meeting in the Drill Hall, Westminster, on Tuesday last in view of the much larger exhibition at the Temple a fortnight hence, must have been agreeably surprised when they found the hall literally packed from end to end. Of course the very large exhibit of water-colour drawings of Irises, Tulips, &c., which was lent by Mr. J. CAPARN, occupied a considerable portion of the central part of the hall, or the building would have been much less crowded. The sketches were sufficiently novel a feature at these meetings, however, to warrant the placing of them in such a position as they could be best seen, but it was regretted that in consequence of this, several exhibits containing really interesting plants were necessarily staged in the darker parts of the building, where it was difficult to appreciate their true appearance. Several collections of Tulips were shown, and among them were several novelties. These were especially appropriate as they illustrated in a practical manner the instructive lecture upon the subject delivered by Mr. J. G. BAKER, F.R.S. The meeting was remarkable also for a really superb display of

Roses, and to one of these exhibits from Mr. Mount, of Canterbury, the unusual award of a Gold Medal was deservedly made. Decorative plants of a miscellaneous character continue to form a prominent feature at these Shows, and in addition to these, and to the fine collections of hardy alpine plants shown, there were on the occasion under notice a display of Peonies and Pyrethrums, and other early summer flowers. An exhibit of Anthurium spathes by Sir T. LAWRENCE also deserves mention, many of the hybrids that have been raised in this garden being very valuable ones. Orchids were present in about the usual quantity. The work of the Fruit and Vegetable Committee still continues light.

#### Floral Committee.

*Present:* W. Marshall, Esq., Chairman, and Messrs. Jno. Fraser, H. B. May, H. Herbst, R. Dean, Geo. Stevens, R. B. Lowe, Jas. Hudson, J. F. McLeod, W. Bain, G. Gordon, Thos. Peed, J. D. Pawle, Chas. E. Pearson, Chas. E. Shea, J. W. Barr, H. J. Jones, E. Beckett, Chas. Blick, H. H. D'Ombraio, Geo. Paul, J. Fraser, G. H. Engleheart, T. Bennett-Poe, Ed. Mawley, R. M. Hogg, Jas. Walker, and Prof. Dr. E. Zacharias.

An Award of Merit was recommended to *Pteris Drinkwateri*, a group of plants of which was shown by Messrs. STROUD BROS., 182, Green Lanes, London, N. It is an exceedingly strong growing variety, and will no doubt be useful for market work. The plants were in 5-in. pots nearly two feet high, with ten to a dozen fronds, the pinnae of which were about  $\frac{3}{4}$  inch wide, and dense green in colour. Later fronds will be much taller.

A group of a semi-double flowered zonal Pelargonium named King of Denmark was exhibited by Mr. R. JENSEN, Mansfield Hill Nursery, Chingford, Essex. They were bushy little plants, and the zone on the leaves was unusually prominent. The flowers are salmon-rose in colour and large, not unlike those characteristic of the Ivy-leaved kinds (Award of Merit).

Messrs. WM. PAUL & SON, Waltham Cross Nurseries, Herts, showed two plants about 4 feet high of *Pyrus Malus Scheideckeri*, with semi-single flowers of very pale rose, the tree was very profusely flowered (Award of Merit). Messrs. PAUL also exhibited plants of a pretty new variegated Ivy, and some seedling forms of *Cydonia japonica*.

Messrs. PAUL & SON, The "Old" Nurseries, Cheshunt, staged a group composed of good and interesting plants in flower. These were of a mixed character, the greater part being hardy, whilst others were greenhouse species. An Award of Merit was recommended to *Cardamine Miss Jekyll*, a pale lilac double-flowered variety. Several hardy Rhododendrons in flower were shown, and some plants of greenhouse varieties equally well flowered. To Rhododendron var. *Profusion* an Award of Merit was recommended. Lilacs were shown in considerable variety, and there were sprays of other flowering shrubs also. A few pot Roses were included, but the greater part of the group consisted in hardy alpine and herbaceous plants (Silver Flora Medal).

A group of Anthurium sprays, in wonderful variety of shapes and colours, was exhibited by Sir T. LAWRENCE, Burford, Dorking (gr., Mr. Bain). The spathes were in earthenware bottles, three of a variety in each. The collection was relieved with Anthurium foliage also (Silver Flora Medal). Sir TREVOY LAWRENCE also exhibited a fine crimson-flowered Cann named *Roi des Rouges* (Award of Merit), and a yellow-flowered variety, *Mine d'Or*.

Mr. GEO. MOUNT, The Rose Nurseries, Canterbury, was the exhibitor of a very large number of cut Roses of excellent quality. Indeed, the superb character of the bulk of the blooms staged was quite unusual, and the collection was the subject of continual remark. The Committee recommended the Award of a Gold Medal, which the exhibit well deserved. There would be near upon 150 blooms in the collection, and a considerable number of varieties were represented. The most noticeable box, however, was one full of the variety *Captain Hayward*. Always a bright-coloured flower, the blooms were on this occasion uncommonly dazzling. Mrs. John Laing, too, was exhibited in really fine form; *Baroness Rothschild*, *The Bride* and *Catherine Mermet*, were also especially noticeable. One large box filled with various Roses, cut with long stems and well-furnished with foliage, was also provocative of much admiration.

A large group of Roses in pots was shown by Mr. WM. RUMSEY, Joyning's Nurseries, Waltham Cross, composed of plants in excellent health and well-flowered. The group was faced with a large number of cut blossoms, also some plants of *Nidderhair Fern*. Amongst the cut blooms, *Marechal Niel* was exhibited finely (Silver Flora Medal).

Messrs. J. ONEAL & SONS, Lowfield Nurseries, near Crawley, were the exhibitors of a collection of sprays of flowering Trees and Shrubs, and a few varieties of *Viola* flowers in sprays. Among the former were noticed sprays of the beautiful *Exochorda grandiflora*, *Wistaria sinensis*, &c. (Silver Banksian Medal).

Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E., exhibited a very fine group of miscellaneous plants, composed chiefly of choice *Dracenas*, *Crotons*, *Palms*, *Caladiums*, and such plants. A little flower was provided by the addition of a few *Gloxinias*, and various hard-wooded greenhouse plants (Silver Flora Medal).

A Bronze Banksian Medal was awarded S. L. STILL, Esq., Woodside, Wimbledon Park (gr., Mr. Curtis), for a group of plants composed of well-grown specimens of *Herbaceous Calceolarias*, *Hippastrums*, *Pelargoniums*, &c.

Messrs. HIGH LOW & CO., Clapton, London, N., made an exhibit of a group of *Caladiums*, and *Crotons*, &c., composed of very choice varieties. Such *Crotons* as *Thompsoni*, *Flambean*, *Agnithusis*, *Russelli*, and *chrysophylla* were shown in excellent specimens (Silver Flora Medal).

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, again staged a group of plants. Included in this were the following—Ward's variety of *Anthurium Scherzerianum* in splendid condition, a fine plant of *Pandanus Bupistii*, *Saxifraga pyramidalis*, *Phyllocactus* var. *Agatha*, a group of excellent plants of *Erica ventricosa* magnifica, *Richardia Elliottiana*, *Epiphyllum Russelli*, *Makoyanum*, the white variety of *Anthurium Andreanum*, a nice lot of *Boronia megastigma*, *B. elatior*, *Cianthus Dampieri* in bloom, *Arisema fimbriatum*, *Tillandsia tessellata*, a very ornamental plant with beautifully marbled foliage, *Leschenaultia biloba*, a very fine *Streptocarpus*, and other things. Messrs. VEITCH also exhibited a group of hardy plants and sprays of flowers, including *Chionanthus virginicus*, *Acer palmatum linearilobum*, a very graceful variety with narrow pale-green foliage (Award of Merit), *Azalea Vaseyi*, *Cornus florida pendula*, *Prunus sinensis rosea* fl. pl., &c. (Silver-gilt Flora Medal).

Messrs. JNO. PEED & SONS, Roupell Park Nurseries, Norwood Road, London, S.E., had a group of miscellaneous plants, bright with *Azaleas* and *Caladiums*, &c. (Silver Banksian Medal).

An excellent group of hardy plants in flower was contributed by Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham. The finely coloured *Trollius Orange Globe* was well shown, and the deeper coloured *T. Fortunei plena*, also the variety *asiaticus*. About a score of nice plants of the purple flowered dwarf *Ranuncula pyrenaica* were conspicuous, a large pan full of the pale yellow flowered *Cheiranthus alpinus* was very pretty, and a group of *Dielytra spectabilis* was in full flower. The showy little *Alyssum saxatile compactum*, *Erimos alpinus hirsutus*, several kinds of hardy *Primulas*, *Orchids*, and a number of finely flowered tree Peonies, were a few of the other components of this collection (Silver Flora Medal).

Messrs. WM. CUTBUSH & SON, Highgate, London, N., arranged a group of plants of considerable extent. In the centre of this were some capitally flowered plants of *Carnation Uria Pike*, and varieties of the *Malmesion* type. Some plants of *Leptospermum bullatum* covered with their axillary white flowers were very cheery, and increasingly gay were the groups of *Indian Azaleas* and *Erica Cavendishii*. *E. coccinea minor*, *E. erecta* and *Boronia heterophylla* were some of the more noticeable objects in the group. A collection of hardy plants and flowers was contributed by the same firm (Silver Flora and Silver Banksian Medals).

From Messrs. BALCHIN & SONS, Hassocks' Nurseries, Sussex, was shown a plant of *Richardia Elliottiana* in which the yellow of the spathe had spread into one of the leaves, as is frequently the case in the ordinary white *R. Ethiopica*.

Messrs. BALCHIN also exhibited a spray of the exceedingly handsome and fragrant stove shrub *Posoqueria macropus*, to which the committee deservedly awarded a First-class Certificate; see fig. 91, p. 583.

Mr. J. WALKER, Thame Nurseries, Oxon, exhibited a superb collection of forty-eight blooms of *Marechal Niel* Rose (Silver Flora Medal).

An Award of Merit was gained by a Rose named Mrs. F. Cant, exhibited by Mr. FRANK CANT, Braiswick Nurseries, Colechester. Several vigorous plants in pots were shown, and from the healthy appearance of the foliage the plant is likely to possess a good constitution. The flowers are palest flesh colour, exceedingly delicate in appearance, and very like to *La France* in general character, though a rose grower has only to see the flower once to be sure it is distinct from that variety.

The DIRECTOR of the Royal Gardens, Kew, contributed a collection of sprays of various species and varieties of *Rhododendron*, and which, for the purpose of comparison, were very valuable and interesting. We shall have another opportunity of alluding to this collection.

Messrs. KELWAY & SONS, Lumpert Nurseries, Somerset, sent a display of Tree Peony flowers, also a large number of *Pyrethrum* flowers in variety, and a small group of *Irises*, including such varieties as *I. germanica major*, *paradoxa*, *spectabilis*, *Pontarabia*, &c. (Silver Banksian Medal).

MARTIN R. SMITH, Esq., The Hayes (gr., Mr. Blick), exhibited a pure white-flowered seedling *Carnation* named *Nell Gwynne*, apparently of considerable merit.

A number of flowers of hybrid *Irises* that were sent by Prof. M. FOSTER, Shelford, Cambridge, were most interesting, and all of them are undoubtedly valuable varieties. They are seedlings, and at present have not been named, but the parentage of each was given.

Mr. M. FRITCHARD, The Nurseries, Christchurch, was awarded a Silver Banksian Medal for a collection of hardy flowers, including the rare *Morisia hypogala* and many of our best hardy spring flowering species.

Messrs. YOUNG & ROBINSON, Holmesdale Nurseries, Stevenage, Herts, exhibited a collection of *Pansies* and *Violas* in bunches laid upon damp moss. A *Viola* named *Stevenage Sweep* struck us as being an uncommonly dark one. Double-flowered *Wallflowers* and some *Tulips* were also shown.

Mr. W. J. CAPARN, of Oundle, Northamptonshire, exhibited a numerous collection of water-colour sketches of *Irises* in great variety, and of *Narcissus*. Examples were remarked, not of course of equal merit, as there was evidently an earlier and a later manner of the Tall Bearded section flowering mostly in the summer season, and a subsection of these of dwarf habit flowering at various seasons; of the *Niphon* section, of which *Pusteriana*, *Boissieri*, and *Bathos* were

examples; *Tulerosus Iris*, as *Palestina caucasica*, *Vartani*, *persica purpurea*; *Reticulate* section as seen in *Junio*; *Dwarf-bearded Iris* like *lutescens*, and *Cengialti*: *Pumila* vars. as *Purity*: cushioned *Irises* such as *Susiana*, *Suwarowii*, and *Catesii*: *Regelia* section, of which *Korolkowii*, *paradoxa* and *Leichtlini* are examples; crested *Irises* as seen in *fimbriata*, and *tectorum*; finally beardless *Irises* of which *sibirica*, *hexagona*, *Kiempteri*, *stylosa* and *areua* may be noted.

A water-colour picture of irregular groups of *Irises* in flower in his garden, in the style of the impressionists, was likewise shown by Mr. CAPARN, which was useful in exhibiting a method of planting both pleasing in effect and truly artistic in treatment, and for that reason not likely to be well carried out by the ordinary gardener.

The collection of drawings of *Narcissus*, if it was less extensive, showed good draughtmanship and colouring. The same were exhibited, if we remember rightly, at the recent Daffodil Conference of the Royal Botanic Society. An Award of a Silver Flora Medal was made.

#### TULIPS.

May is the month of the Tulip, and that it was largely represented on Tuesday is not surprising. They were there in all types—early and late, breeder and broken, with not a few species and varieties.

The florists' varieties were particularly prominent: the choicest collection came from Mr. J. Walker, nurseryman, Thame, this Oxfordshire town having been a home of the Tulip for many years. Bizarres, gaudy in gold and dark brown to black, were represented mainly by flamed varieties, such as Sir J. Paxton, some of them very dark; Dr. Hardy, one of the brightest, gold and dark red being seen in happy combination; *Horreus*, in the way of Dr. Hardy, but paler in the ground colour; *Richard Yates*, pure, and finely marked; *General Grant*, pure, but heavily feathered; *Masterpiece*, nicely feathered, but weak in the flame; *George Hayward*, very bright and pure, the petals much flooded with colour; and *Gold Cup*, having a deep golden ground, but deficient both in feather and beam. There was but one feathered bizarre, *La Circassienne*, bright yellow, delicately and regularly feathered with red, but sadly stained at the base; the petals a little pointed, yet a bright and pleasing flower. All the byblomms were flamed, and consisted of *Passé Colpade*, fine shape, pure in the ground, nicely feathered, but heavily flamed. *Talisman*, also pure but heavy in colour. *Bessie*, large weak in the feather; *Lord Denham* wanting both in feather and beam; *Duchess of Sutherland* much suffused with colour; Mrs. John Walker wanting in colour, and Mrs. H. F. Stone. The roses were also confined to flamed flowers, such as *Annie McGregor*, very bright, but heavy in colour; *Triomphe Royale* and *Heroine*, likewise flowered. *Modesty*, very pretty; *Aglaia* and *Mabel*. There were some charming breeders or self-coloured flowers, viz., *William Lee*, so dark as to be almost black; *Richard Yates*, deep bronzy-crimson; Sir J. Paxton very fine, some darker than the others, but all very pure in the base; and rose-breeder, *Annie McGregor*, delightful in its tint of bright rosy scarlet. Evidently the flowers had not been shaded, which will account for several of them being so heavily flooded with the breeder colour.

There was quite a large collection from Messrs. JAMES VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea. Here the early single and double varieties, represented by large blooms, were prominent. Of double varieties, *Duke of York*, *Rox Rubrum*, *Alba Maxima*, *Henri White*, having the appearance of a double *Keizer's Kroon*; *Parnassian*, rose; *Don Carlos*, crimson; *Reine des Roses*, pale rose; *Lord Beaconsfield*, deep rose; and *Helianthus*, crimson, deeply edged with gold. Of single varieties, *De Keizer*, crimson, with yellow base; *Alba regalis*, white; *Princess Royal*, white, edged with deep rose; *Couleur Cardinal*, shaded crimson, very fine, and a superb bedder; *Empress of India*, orange scarlet; *Golden Eagle*, feathered with red on a golden ground; *Stanley*, bright deep rose; *White Swan*, *Pink Beauty*, deep pinkish scarlet, with a white flame to each petal; *Goldfinch*, yellow; *Queen Victoria*, white, delicately edged with pink; *Nelly*, large white; *Ophir d'Or*, deep yellow; *Duode Grillon*, bronzy rose; *Spandouck*, white ground, crimson flame; *Queen of the Netherlands*, a fine semi-double striped and suffused rose on white; with such species as *retroflexa*, and *cornuta*; and examples of the showy parrot varieties (Silver Flora Medal).

Messrs. BARR & SON, King Street, Covent Garden, staged a remarkable collection, especially of the florists' type, the Darwin breeders as they are termed, Parrot Tulips, &c. Among what are termed the May flowering garden varieties there were *Golden Beauty*, *Bouton d'Or*, *macrospila*, a very showy late; form *Golden Eagle*, yellow feathered with red; *Gesneriana*, glowing vermilion, with a metallic blue base; *Gala Beauty*, yellow, with a flame of crimson, scarlet up each petal. *Chameleon*, a very singular form, black, violet, cream, yellow, &c.; *Fulgens*, rich showy crimson, the petals reflexing somewhat, pure yellow base; *Fairy Queen*, pale rosy violet; margined yellow, the inner petals white, very novel and pleasing; and *Striped Beauty*, rose, crimson and white. Of species there were *Bataini* (Award of Merit), of a soft Primrose colour, *Digieri*, vermilion, the black base surrounded by a creamy ring; *saxatilis*, having a golden base to the petals inside and out, deeply edged with delicate lilac rose (Award of Merit). The Darwin breeders were also in great force, and in many colours, conspicuous among them the *Sultan*, medium-sized, finely formed, almost black, but with a glossy, bronzy sheen (Award of Merit), said to be a very excellent garden variety; *Heela*, deep wine-crimson, and *Bronze King*, golden-bronze, were also very fine. Some of the best of the English florists' Tulips were also represented

but the method of showing them in boxes covered with white paper, is not to be commended (Silver-gilt Flora Medal).  
 From the Royal Gardens at Kew came a group of species and varieties, such as *Lindolia*, brilliant scarlet, with a dark base, very striking—this is quite a dwarf-growing form; *Vittellia*, very soft primrose, almost white; *Parisienne*, two forms, one white the other yellow, in each case delicately edged with rose; forms of *Dicieri*, *Picotée* and *Golden Eagle*, being noticeable; also examples of *retroflexa*, *acuminata*, *cornuta*, *Eichleri*, &c. To most collections of hardy flowers shown on this occasion, bunches of Tulips found a place.

**Narcissus Committee.**

Present: J. T. Bennett-Poë, Esq., in the Chair; and Rev. G. H. Engleheart, Messrs. P. Barr, A. Kingsmill, and J. Walker.

Except the very latest varieties, Narcissi were evidently out of flower by this date, for even such specialists as Messrs. BARR & SON showed only a few vases of *Jonquils*, *poeticus recurvus*, &c., among the Tulips, which now hold the field.

The prize for the best new seedling of the meeting was awarded to the Rev. G. H. ENGLEHEART'S poeticus "Spenser," a broad petalled, flat flower, raised between the early *N. p. ornatus* and the late *N. p. recurvus*. He also showed a very large and striking late Trumpet Daffodil, of deep self-yellow, named "Sol."

An Award of Merit was given to *N. Bernardi* var. *Philip Hurt*, from Rev. C. WOLLEY DOD, Edge Hall, Cheshire. This is of great value as a late-blooming Narcissus; the perianth is creamy-white; the corolla is wholly of a rich orange-red.

The prize for the best new Narcissus exhibited at any Royal Horticultural Society Meeting in 1896, has been gained by the Rev. G. H. ENGLEHEART'S "White Queen," shown April 7 (Silver-gilt Flora Medal).

**Orchid Committee.**

Present: Harry J. Veitch, Esq., in the Chair, and Messrs. Jas. O'Brien (Hon. Sec.), A. H. Smee, W. H. Protheroe, R. Brooman-White, T. W. Bond, H. J. Chapman, S. Courtauld, T. B. Haywood, W. Cobb, C. Winn, Dr. M. T. Masters, H. Ballantine, J. Douglas, and H. M. Pollett.

The meeting preceding the great Temple Show is usual y a quiet one, but on this occasion a much better display than usual was made, the fine group of well-grown, well-flowered, and artistically staged Orchids, for which Messrs. JAS. VEITCH & SONS were awarded a Silver-gilt Flora Medal, being equal to the best ever seen at the Drill Hall. The centre of the group consisted of many varieties of the soft-tinted *Cattleya Schroderae*, which vary in colour from blush to pink, and with a lip which, in the different specimens, was of a peculiar orange glow of varying degrees of intensity. There were remarked besides, a good plant of the snow-white flowered *Cattleya intermedia alba*; the pretty *Lelio-Cattleya* × *Zephyra* (*L. xanthina* ♂, C. Mendeli ♀), with its nanken-yellow flowers, veined with rose at the tip of the labellum; the singular *Dendrobium* × *Stratius* (*japonicum* ♂, *Dalhousieanum* ♀); the India yellow and purple *Lelio-Cattleya* × *Hippolyta*; the wax-like, white tipped with rose, *Chysis* × *Langleyensis* (× *Chelsoni*, × *bracteosus*) (Award of Merit); a fine variety of *Miltonia* × *Bleuana nobilior*; *Cypripedium Lawrenceanum*, *Hyeaanum*, and other rare species. In another part of the group were plants of *Anguloa Clowesii*, *A. uniflora*, and the pink *A. uniflora Turneri*; a fine plant of *Maxillaria Sanderiana*, *Cypripedium Chamberlainianum*, *C. × Morgania*, and *C. × euryleucis*; *Masdevallia* × *Heathii*, and good varieties of *M. ignea*; *Lycaste Deppii*, and varieties of *L. Skinneri*; and interspersed were fine sprays of *Oncidium Marshallianum*, *Odontoglossum ramosissimum*, *O. crispum*, *O. Pescatorei*, *Cattleya Lawrenceana*, *C. Walkeriana*, *Lelia purpurata*, &c.

Few in number, but of fine quality, were the constituents of the group of Orchids shown by Baron Sir H. SCHROEDER, The Dell, Egham (gr., Mr. H. Ballantine); the more remarkable was *Vanda teres gigantea*, a variety which is an advance in all respects on the type, especially in the size of its growths, the inflorescence, and the size of the flowers. The colour of the latter resembles the best form of the type, which is no faint praise. The true plant is only to be found at The Dell and at Tring Park (First-class Certificate). Another fine exhibit was *Dendrobium thyrsoiflorum* Lowii, with many fine spikes of cream-white flowers, the chief peculiarity being in the fixed, abnormal shape of the lip, which is narrow, spoon-shaped, and much flatter than in the ordinary form. The lip is also cream-white marked with a yellow streak. It is a further development of the plant figured in the *Lindensia*, Vol. VI., pl. CCXLI., as *D. Gallieanum* (Award of Merit). In the same group were the very beautiful *Lelio-Cattleya* × *Dighyana-Mossie*; a very pretty *Odontoglossum* × *Wickeanum*, with flowers coloured like those of *O. × excellens*; some very fine *O. crispum*, one of the blotched varieties being superb; the clear white-flowered *O. Pescatorei leucocanthum*, a noble *O. luteo-purpureum* and *O. Ruckerianum*; *Masdevallia Veitchii grandiflora*, with fifteen flowers; *Cypripedium Lawrenceanum* *Hyeaanum*, &c. (Silver Flora Medal).

The Hon. WALTER ROTHSCHILD, Tring Park (gr., Mr. E. Hill), sent a pretty spotted form of *Catasotum macrocarpum*, the labellum of which was pale green, and the other segments yellow dotted with purple (Botanical Certificate); *Cattleya* × *intermedio-Loddigesii*, received from Rio de Janeiro as a natural hybrid of the species named. The sepals and petals are bluish-white with a few purple spots;

front of the lip purple-crimson. In general appearance it is close to some varieties of *C. intermedia*, but the pronounced isthmus to the middle lobe of the lip as seen in *C. intermedia*, combining with the more ample and frilled edge of *C. Loddigesii*, seems to indicate mixed parentage; also a very pretty *Epidendrum* with cream-white flowers, veined with cinnamon brown, and produced in a showy branched spike.

Sir WREYMAN PEARSON, Bart., M.P., Paddockhurst, Crawley (gr., Mr. Csp), showed three grand specimens of *Cattleya Lawrenceana* with an aggregate of twenty-one spikes of very brilliant and richly-tinted flowers; also several well-flowered *Dendrobium nobile*; a fine spike of the singular purple and green *Catasotum stupendum* (Botanical Certificate); and a fine form of *Cattleya Schroderae* (Silver Banksian Medal).

J. T. BENNETT-POË, Esq., Hohnwood, Cheshunt, was awarded a Silver Banksian Medal for a stand of fifteen fine plants of *Cattleya citrina*, furnished with fine racemes of flowers. The plants, it was stated, had been grown cool. WELBORE S. ELLIS, Esq., Hazelbourne, Dorking (gr., Mr. Masterton), showed a group of fine varieties of splendidly-grown *Odontoglossum crispum*; a fine variety of *Coelholia Noeliana*, and another of *Dendrobium Hildebrandi* (Silver Banksian Medal).

Messrs. F. SANDER & Co., St. Albans, staged a very effective group, in which were a magnificent variety of *Oncidium varicosum Rogersii*; the pretty South African *Stenoglottis longifolia*, with tall spikes of lilac flowers; *Cypripedium* × *grande*, *Dendrobium superbum eusomum*, *D. Bensonae*, and *D. densiflorum*; the singular *Eria bracteosus*, of which two varieties were shown (Botanical Certificate); *Lycaste Deppii*, *L. Skinneri*, *Miltonia Phalenopsis*, *Spathoglottis Lobbi*, and a singular little Orchid with rose coloured flowers, which the Committee referred to Kew.

C. L. N. INGRAM, Esq., Elstead House, Godalming (gr., Mr. Bond), showed *Lelio-Cattleya* × *Eudora* (*L. purpurata* × *C. Mendeli*), with flowers of the L.-C. *eximia* class, and with yellow tinge in the throat (Award of Merit); *Cattleya* × *Preciosa* (*C. speciosissima* × *C. Lawrenceana*), and *C. × Sedeni* (*C. Lawrenceana* × *Percivaliana*), both of which bore some resemblance to the handsome *C. × Wm. Murray*.

C. J. LUCAS, Esq., Warnham Court, Horsham (gr., Mr. Duocan), showed the singular *Bolhophyllum tremulum*, with feathery lip, like *B. harbergiana*. It was imported from Koorg, India (Botanical Certificate); and *Odontoglossum Italli grandiflorum*, a noble form of the *O. H. xanthoglossum* type (Award of Merit).

A. H. SMEE, Esq., The Grange, Wallington (gr., Mr. Cummins), showed *Oncidium varicosum Rogersii*, with remarkable pseudo-bulbs, in some respects like those of *O. Marshallianum*, which the large yellow flowers in colour also nearly approached; also a very poor form of *Cattleya Mossie*, purchased as *C. Guariocensis*, the so-called blue *Cattleya*. W. VANNA, Esq., Camden Wood, Chislehurst (gr., Mr. W. H. Robbins), showed *Odontoglossum crispum* Princess, a splendid variety, of perfect form, and decorated with one large irregular blotch on each sepal, the back of the petals having purple blotches which were visible on the other side (Award of Merit).

THOS. STATTER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), sent *Lelio-Cattleya* × *Highburyensis* (*L. cinnabarina* × *C. Lawrenceana*), a remarkable example of rapid growth in a garden cross, the two longest bulbs having been developed in 1895.

E. H. ADCOCK, Esq., Ribblesdale, Dorking (gr., Mr. J. Green), showed a specimen of *Cypripedium bellatulum*, consisting of one plant bearing ten flowers (Cultural Commendation).

WALTER COAN, Esq., Dulcote, Tunbridge Wells (gr., Mr. Howes), showed *Miltonia Roezii* alba, Cobb's var. It had large white flowers with a chrome yellow marking on the lip (Award of Merit).

C. YOUNG, Esq., The Thorns, Sevenoaks (gr., Mr. S. J. Ryder), showed *Odontoglossum polyxanthum*, with a six-branched spike of twenty-seven flowers (Cultural Commendation). R. BROOMAN-WHITE, Esq., Arddaroch, Garelochhead (gr., Mr. Roberts), showed out spikes of *Odontoglossum*. W. A. BEVAN, Esq., Coombe Court, Kingston, sent *Odontoglossum Pescatorei*, Mrs. W. A. Bevan, a fine form with purple blotched sepals and lip. J. FORSTER ADCOCK, Esq., Northchurch, Herts, sent *Lacena bicolor* and *Cattleya citrina*. Messrs. W. L. LEWIS & Co., Southgate, sent *Odontoglossum Pescatorei Lewisii*, *Cattleya resplendens* and *Cattleya citrina*. J. BRADSHAW, Esq., Southgate (gr., Mr. Whiffen), staged a neat group of *Odontoglossums*, *Cattleyas*, *Oncidium Marshallianum*, *Chysis*, &c. (Silver Banksian Medal), and T. FIELDEN, Esq., Grimston Park, Tadcaster (gr., Mr. Clayton), showed *Lelia purpurata* Grimston var., large in size, fine in form and with a rich maroon purple lip (Award of Merit).

**Fruit Committee.**

Present: Philip Crowley, Esq., in the Chair; and Messrs. Robt. Hogg, T. Francis Rivers, Jos. Cheal, H. G. Pearson, A. F. Barron, G. W. Cummins, Geo. Bonyard, T. J. Saltmarsh, Alex. Dean, J. W. Bates, T. Glen, Geo. Wythes, Geo. Reynolds, H. Balderson, and G. H. Sage.

An Award of Merit was recommended to Radish Olive-shaped Bright Red Leafless, from Messrs. VILMORIN & Co., Paris. The roots had been grown at Chiswick. Its chief merit as a variety for forcing is, apparently, the miniature character of the foliage, for although not leafless (as is implied by the name), the leafy part of the plant is so small and buff-like that the roots might be grown quite closely together.

Messrs. CARTER & Co. exhibited their Express Forcing Radish, a nice red, long root; and Messrs. R. VEITCH & SONS, Exeter Nurseries, showed a Radish named Ever Tender, a round root, of rather pale colour.

Earl PERCY, Syon House, Brentford (gr., Mr. Geo. Wythes), exhibited a large box of ripe fruits of Royal Sovereign Strawberry, of excellent quality; also some excellent Amsden June Peaches, which had been gathered within five months from the time the trees were started (Cultural Commendation); and a dozen or so of ripe fruits of Brown Turkey Figs (Cultural Commendation). Mr. WYTHES also showed some of Wythes' Seedling Kidney Potatoes, which had been grown in nine weeks, and were the product of two sets, weight 3½ lb.

Messrs. LAXTON BROS., Bedford, exhibited some capital fruits of Royal Sovereign Strawberry. W. A. HENDERSON, Esq., Buscot Park, near Faringdon (gr., Mr. W. Mead), sent four excellent ripe Melons in two varieties, viz., Countess, and a seedling which has been grown at the establishment for some years. Another Melon was shown by JOS. WHEATLEY, Esq., Woodlands, Mirfield (gr., Mr. G. Firth).

Fruits of Apples, Sturmer Pippin, still in good preservation, were shown by H. BOGHUST FISHER, Esq., Pit Place, Chelmsford.

A collection of varieties of Rhubarb was exhibited from the gardens of the Society at Chiswick. Included were Dancer's Early, Ryder's Perfection (Victoria), Victoria, Collis's Seedling, Laxton's No. 1 and Laxton's No. 2, Buckley's Crimson, Paragon, and Hawke's Champion. The well-known Victoria not having previously been distinguished by an Award of Merit from the Royal Horticultural Society, the Award was now tardily made. It still appears to be the best of any, though a similar Award was recommended to the variety Collis's Seedling, as shown the largest-growing of any, but it was not so well coloured as the Victoria.

**Lecture.**

**THE SPECIES AND VARIETIES OF TULIPS.**

In the afternoon was delivered a Lecture upon the above subject by Mr. J. G. BAKER, F.R.S., of Kew. The Rev. Prof. HENLOW occupied the Chair.

At the commencement Mr. BAKER described the geographical distribution of most of the species of Liliaceae, and particularly of the tribe Tulipeae. This tribe included about half a dozen genera, and they are peculiar to the north temperate zone. The genus *Tulipa* had its head-quarters in Central Asia, and stopped abruptly with the old world. There are no Tulips native to America, but another genus of the same tribe, viz., *Calochortus*, was found there, and so completed the chain round the world. *Calochortus* was partly or wholly confined to the western side of America, Gagea, another genus of the tribe, was entirely peculiar to the north temperate zone.

Of the genus *Tulipa*, Mr. BAKER said, there had been many new species made known during recent years. From Central Asia, many of these had been discovered by Russian explorers, and afterwards they had been described by Russian botanists, which accounted for the (to us) extraordinary names that had been given them. They were in most cases named after the collector who had first discovered them. These new species amounted to something like fifty per cent. of those previously known. They did not, however, furnish any new types, and as they were easily placed in previously existing groups, they had not interfered with the classification of the genus. The principal differences which divide the species of the true Tulips for botanic purposes, consist in the hairy or glabrous character of the filaments of the stamens, and in the smooth or woolly exterior of the bulbs. Many other minor features are useful for sub-division.

**WINCHESTER GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**

APRIL 30.—The monthly meeting was held at the Young Men's Christian Association rooms on the above date, W. MAVO, Esq., presiding; and Mr. J. Miles, gardener, Portwood House, Southampton, read an interesting paper on the chief points of fruit culture, to a good audience.

Mr. MILES, having about 200 varieties of Apples under his care, directed attention chiefly to that fruit; and illustrated his remarks on pruning with examples of his ideas, showing the results of good and bad pruning; and in the case of the bad, showed what should be done to them at the proper time. Root-pruning also came in for its share of consideration, and here again the lecturer availed himself of a specimen fibrous root. Insects affecting the Apple, canker, mildew, received their share of notice. Mr. MILES gave a list of the best dessert and culinary varieties, and hints on exhibiting.

A good idea of the executive was the handing round to members a printed List of Apples which had been found to succeed in the neighbourhood of Winchester, where the soil consists largely of chalk and strong loam.

The meeting terminated with a vote of thanks to the lecturer, who, in responding, made an appeal on behalf of the Royal Gardeners' Orphan Fund, giving at some length the objects of the fund, and the advantages of membership.

**CATALOGUES RECEIVED.**

YOUNG & ROBINSON, Holmesdale Nurseries, &c., Stevenage, Herts.—*Begonias*, *Oloxinias*, *Chrysanthemums*, &c.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (Day-deg., Day-deg., Day-deg., Day-deg., 10ths Inch, Ins.), RAINFALL (Inch, Ins.), and BRIGHT SUN. (Ins.). Includes data for districts 0-10 and a summary row.

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c.; Districts — 6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; \*Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending May 2, is furnished from the Meteorological Office:—

The weather during the period was fine and dry over the kingdom as a whole; but some considerable falls of rain were experienced in the extreme north and north-west during the earlier part of the week, and showers of cold rain, sleet, and soft hail in many districts later on. Thunderstorms occurred in several parts of Great Britain during the middle part of the week.

The temperature, as a whole, did not differ much from the mean, being high during the earlier, and low during the latter, part of the week. The highest of the maxima were registered either on the 26th or 27th, and varied from 69° in 'England, E.,' and 68° in 'England, S.,' to 69° in 'Scotland, W.,' 'England, N.W.,' and the 'Channel Islands,' and to 58° in 'Scotland, N.' The absolute minima were very low for the time of year; they were recorded, as a rule, on May 2, when the sheltered thermometer fell to 28° in the 'Midland Counties' and 'England, S.W.,' 29° in 'Ireland, S.,' and to between 31° and 33° in most other parts of the kingdom. In 'England, N.E.,' however, the lowest reading was 35°, and that in the 'Channel Islands,' 39°. Shary ground-frosts were very general during the latter part of the week.

The rainfall exceeded the mean in 'Scotland, N.,' 'Ireland, N.,' and 'England, N.W.,' and just equalled it in 'Scotland, W.,' but in all other districts there was a considerable deficit.

The bright sunshine was again deficient in 'Scotland, N.,' but either equalled or exceeded the normal in all other districts. The percentage of possible duration ranged from 55 in the 'Channel Islands,' 57 in 'England, S.W.,' and 50 in 'Ireland, S.,' to 34 in 'Scotland, E.' and 'England, N.E. and N.W.,' and to 26 in 'Scotland, N.'

MARKETS.

COVENT GARDEN, MAY 7.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing plants in pots with columns for s. d. s. d. and prices. Includes Adiantum, Arum lilies, Aspidistra, Azalea, Cineraria, Dicycla, Dracena, Erica, Evergreen shrubs, Ferns, and Ficus elastica.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flowers with columns for s. d. s. d. and prices. Includes Arums, Azalea, Bluebells, Bouvardias, Carnations, Cowslips, Daffodils, Dentia, Eucharis, Gardenias, Iris, Lapageria, Lilac, Liliun Harrisii, Lily of the Valley, Maidenhair Fern, Marguerites, Mignonette, Narcissus, Pelargoniums, Polyanthus, Pyrethrums, Roses, Spiraea, Stephanotis, Tuberoses, Tulips, Violets, and Orchid-bloom.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing fruit with columns for s. d. s. d. and prices. Includes Apples, Grapes, Peaches, Pine-apples, Strawberries, and Tasmanian Apples.

The fruit by the sea. Rome arrived in splendid condition, which were all sold on Wednesday. Demand good at from 10s. to 15s. A small quantity from Victoria sold up to 18s. per case. Grapes from 18s. to 25s. per case.

Our next arrival is due per S. Austral, to be sold on Monday, the 11th inst.; and, as she brings over 20,000 cases, lower prices may be anticipated. J. B. Thomas.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table listing vegetables with columns for s. d. s. d. and prices. Includes Asparagus, Beans, Cucumber, Mushroom, Peas, Onions, Parsley, Potatoes, and Tomatoes.

NEW POTATOES.

Market remains firm, and prices quite up to last week's. J. B. Thomas.

SEEDS.

LONDON: May 6.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, although as might be expected, there is now a daily diminishing consumptive demand for Clover and Grass seeds, value for same are receiving considerable support from an increasing speculative inquiry, and also from some export business. It is somewhat unusual for the close of the sowing season to witness higher prices than at any previous period. Notwithstanding, however, the recent rise, fine samples are still obtainable at very moderate figures. Tares are neglected. Rape seed favours buyers. There is no change in Mustard. For Canary seed there is an improving sale. Hemp seed also tends upwards. Some remarkably clean Linseed is offering at tempting rates. Peas and Haricots keep steadily.

FRUIT AND VEGETABLES.

Borough: May 5.—Quotations:—Cabbages, 2s. 6d. to 3s. per tally; new Carrots, 5d. to 6d., and Turnips, 6d. per bunch; Broccoli, 1s. per bag; Spring Onions, 9d. to 1s. per dozen bunches; Spinach, 2s. to 2s. 6d. per bushel; Onions, 5s. to 5s. 9d. per bag.

SPITALFIELDS: May 5.—Quotations:—Cabbage, 1s. 6d. to 3s. per tally; bunch Greens, 1s. 3d. to 1s. 9d. per dozen; Onions, spring, 1s. to 1s. 6d. per dozen bunches; Parsley, 9d. to 1s. do.; Mint, 1s. 6d. to 2s. do.; Leeks, 1s. to 1s. 6d. per dozen; Beetroots, 1s. 3d. to 1s. 6d. per bushel; Cauliflowers, 5s. to 7s. per tally; Asparagus, 1s. to 1s. 6d. per bundle; Carrots, 25s. to 40s. per ton; Turnips, 20s. to 35s. do.; Rhubarb, 1s. 6d. to 2s. per dozen bundles; Cucumbers, 2s. 6d. to 3s. per dozen; Lettuce, 6d. to 6d. per dozen.

STRAFORD: May 5.—Quotations:—Cabbages, 1s. 6d. to 3s. 6d. per tally; Greens, 1s. 3d. to 1s. 6d. per bag; do., 1s. 9d. to 2s. per dozen bunches; Cauliflowers, 1s. 6d. to 1s. 9d. per dozen; do., 5s. to 7s. 6d. per tally; Beetroot, 1s. 3d. to 1s. 6d.; Horseradish, 1s. 2d. to 1s. 3d. per bundle; Parsley, 1s. to 1s. 6d. per dozen bunches; Rhubarb, field, 1s. 6d. to 2s. per dozen bundles; White Turnips, 1s. 6d. to 2s.

per dozen bunches; egs, 1s. 6d. do.; Spring Onion, 1s. to 1s. 6d. do.; Salad, 1s. 6d. per dozen punnets; frame Cucumbers, 2s. to 3s. 6d. doz.; Carrots, household, 2s. to 2s. 6d.; do., cattie feeding, 2s. to 2s. 6d.; Mangels, 10s. to 16s. do.; Onions, Egyptian, 5s. 9d. to 6s. 3d. per case; Apples, Tasmanian, 10s. to 10s. 6d. do.; do., Nova Scotian, 18s. to 20s. per barrel.

FARRINGTON: May 7.—Quotations:—Cauliflowers, 1s. 6d. per dozen; Cabbages, 9d. per dozen; Leeks, 1s. per dozen; Beet, 9d. per dozen; new Carrots, 10d. per bunch; new Turnips 10d. per bunch; Asparagus, 1s. 9d. large bunches; Rhubarb, 1s. 9d. to 2s. per dozen bundles; Cucumbers, 2s. 6d. per dozen; Mint, 2s. per dozen bunches; Apples, Tasmanian, 10s. to 14s. per case.

POTATOS.

BOROUGH: May 5.—Quotations for Old Potatoes ranged from 30s. to 70s. per ton; and New sold at from 10s. to 14s. per cwt.

SPITALFIELDS: May 5.—Quotations:—Highlands: Magnums, 40s. to 50s.; Bruce, 35s. to 45s.; Main Crop, 40s. to 55s.; Reading Giants, 40s. to 50s.; Drones, 55s. to 60s.; Blacklands, Bruces, 30s. to 40s.; Giants, 30s. to 40s.; Imperators, 30s. to 35s.; Scotch Bruce, 45s. to 55s. Main Crop, 50s. to 60s.; Dunbar do., 70s. to 85s.; Bruce, 70s. to 80s. per ton.

STRAFORD: May 5.—Quotations:—Dark soil, Bruces, 20s. to 25s.; light do., 25s. to 50s.; Reading Giants, 30s. to 40s.; Sutton's Abundance, 30s. to 50s.; Scotch Main Crop, 40s. to 60s.; Dunbar Magnums, 50s. to 70s. per ton.

FARRINGTON: May 5.—Quotations:—Best Main Crop, 70s. to 80s.; Drones, 50s. to 60s.; Bruces, 40s. to 50s.; Magnums, 35s. to 45s.; Imperators, 25s. to 30s.; Darton's Rounds, 25s. to 30s. per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.) for the week ending May 2, and for the corresponding period last year:—1896: Wheat, 25s. 8d.; Barley, 22s.; Oats, 14s. 3d.; 1895: Wheat, 21s. 4d.; Barley, 20s. 5d.; and Oats, 14s. 3d.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 65s. to 85s. 6d.; inferior, 38s. to 60s.; Hay, best, 60s. to 80s.; inferior, 30s. to 55s.; mixture, 60s. to 84s.; and straw, 24s. to 40s. per load.

\* Correspondents not answered in this issue are requested to be so good as to consult the following number.

ANTS ON TURF. G. A. Pour carbolic acid dissolved in water into their nests.

CARNATION: S. G. J. Not Germania. Good, but not extraordinarily so.

CUCUMBER ROOTS CLUBBED: J. H. The result of eel-worms in the root, often described and figured. The creatures are in the soil; there is nothing for it but a change of soil.

DISEASED CARNATIONS: J. F. The Carnations are attacked by Heterosporium echinulatum, of which there can be no mistake, as the mould is in full fruit. Better clear off and burn diseased plants if you wish to save the rest. M. C. C.

EUCHARIS GRANDIFLORA: Young Gardener. You seem to be growing the plant in the proper temperature, but whilst growing very freely, and the roots not in a pot-bound state, it is sometimes springing in flowers. It will, however, do better as time goes on. If the drainage is in good order, do not disturb the plant at the root. Some gardeners afford no rest-period, in the sense of keeping them dry; but afford the plants less water for two or three months, and then gradually increase the amount, with the result that they throw up a crop of blossoms, and this method seems to be what suits the plant best, for a decided drying-off has a weakening effect, and is often the forerunner of an attack of the bulb-mite. It is a bad practice to often divide up petfuls of plants with the idea of increasing the stock of them; let them alone if they are doing well. In potting, use a heavy, unctuous loam, and no manure, as that can be applied best as a liquid; but use some coarse sand

in the soil, so as to let the water pass freely away, but not too freely, the Eucharis being half an aquatic. Moreover, it dislikes a loose soil, therefore pot firmly, but do not use a rammer, as that would cause too much pressure about the fleshy roots, and might bruise them. The plant is not shade-loving, therefore let it have a considerable amount of sunshine in the summer—in the winter it cannot have too much. Plants in flower may be shaded, but not the entire collection; and the plant should not be so placed that any undue lengthening of the leaves takes place, nor should it be placed on dry shelves in a hot house, with the idea of bringing it up to the light. The best place is a low pit, the plants being placed on a stage, or elevated in some way.

**FERN SPORES:** *Margaret*. If you have a damp moss-grown wall in your warm-house or green-house, scatter the spores thereon, and most of them will grow, and, when large enough, they can be removed and placed in thumb-pots. If no such wall exists, the spores may be sown on slabs of half-decayed peat, or in pots of peaty soil. This peaty soil should be baked to kill moss-spores and weed-seeds, and then made moist by burying it in moist earth, or in other ways. Afford the seed-pots plenty of drainage; use a large proportion of sand in the compost, press the soil firmly into the pots or pans, make level and sow the spores thinly, stand in a shady spot in a greenhouse or hothouse, according to the species of Fern sown, and keep the soil moist, preferably by dipping the pots in a pail of water till the water rises almost to the surface. If no glasshouse is available, the seed-pans may be covered with a bell-glass, having a hole for ventilation at the top, or in a Fern-case in a window.

**FUCHSIA:** *A. E. N.* We cannot undertake to name florists' varieties.

**HEDGE IN THE "BLACK COUNTRY:"** *F. B.* We do not know what is meant by "Wild Fig." You might test the smoke-withstanding properties of the common Privet, planting it at 8 inches apart, the bottom of the hedge being made further secure against the fowls by some large-meshed rabbit-proof wire. Do not use a small-meshed sort, or the birds will get lanced therein. If long stakes like Hop-poles are driven into the soil in the line of the hedge, and stout iron wire secured to these, the plants may be allowed to grow 10 feet high. You might plant *Lycium barbarum* here and there, as it will keep the hedge together, making it more impenetrable.

**INSECT:** *T. D.* The grub in your tree is *Zenizera æsculi* (fig. 95).

**INSECT ON RASPBERRY:** *Miss P.* The Raspberry-moth (*Lampronia rubiella*, fig. 96). The caterpillars pass the winter in the earth. The eggs are hatched in the flower, the caterpillars making their way out by a hole at the base. Cart-grease smeared round the base of the canes, or kerosene emulsion washed round the stems, might be tried. In any case, all affected canes should be burnt. See *Board of Agriculture Report on Injurious Insects, &c.*, 1892, p. 15; and for a full account, Westwood, in *Gardeners' Chronicle*, 1853, p. 757.

**KITCHEN GARDEN CALENDAR, MAY 2.** Mr. C. Herrin desires us to state that the rows of Runner Beans when stopped at 1 foot in height should be 3 feet apart—not 8 feet, as there given.

**LYCASTE:** *C. E. S.* The points of the leaves may have turned black from mechanical injury, from low temperature, or from the plant getting dry at the root whilst at rest or at other times.

**MILDEW ON M. NIEL ROSE:** *Nemo*. Employ sulphur in the dry state, or mix some with hot water, as mustard is made, and dilute the mixture, so that it can be used with a syringe, and distributed over the plant. The Bordeaux Mixture is likewise good against all kinds of fungus diseases of plants, the formula for making which has repeatedly been given in these pages. Let the air of the house be more buoyant and less moist.

**NAMES OF PLANTS: Flowers.** 1. *Bifrenaria Harrisonæ*; 2, *Clematis*; 3, send frond with spores: the young immature frond withered; 4, *Adiantum capillus-veneris*; 5, *Selaginella casia*; 6, *Aloe verrucosa*.—*C. & S.* *Reseda alba*.—*E. M. A.* 2, *Solanum aviculare* (laciniatum); 3, *Dolichos gibbosus*.—*Alpine.* 1, *Saxifraga Compositi*; 2, *S. palmata*.—*F. N.* An Aroid, of which we will give you the name next week.—*J. H.* *Dentaria bulbifera*.—*P. M. J.* 1, *Forsythia viridissima*; 2,

*Berberis stenophylla*; 3, *Berberis empetrifoli*; 4, *Cupressus* (*Retinospora*) *obtusata* var. *filicoides*; 5, *Cupressus* (*Retinospora*) *obtusata*; 6, a form of *Thuja orientalis*.—*M. R.* Another time send to the Editor, and not to the Publisher, unless the letter relates to advertisements. 1, *Andromeda calyculata*; 2, *Vinca minor*, gold-leaved var.; 3, *Anchusa italica*; 4, *Triteleia uniflora*; 5, *Asphodelus luteus*; 6, *Fritillaria* sp.—*S. R.* 1, *Scilla campanulata* alba.—2, *Primula farinosa*; 3, 2, *P. abyssinica*, yellow; 4, *Omphalodes verna*, blue; 5, *Saxifraga* *Wallacei*; 6, *Tussilago fragrans*. Your paper labels were sodden with the wet moss, and in some cases torn, and in others illegible.—*C. W.* 1, *Asphodelus luteus*; 2, *Ribes aureum*; 3, *Meda Aze-*

FIG. 95.—ZENIZERA ÆSCULI; WOOD LEOPARD-MOTH.

*darach*.—*L. C.* 1, *Bifrenaria Harrisonæ*; 2, *Iberis coriifolia*; 3, *Saxifraga cordifolia*; 4, *Stachys lanata*.—*J. R.* A very pretty variety of *Dendrobium nobile*.—*F. H. A.* All varieties of *Cattleya intermedia*.—*E. C. L.* 1, *Coryanthes Feildingi*; it is uncommon in gardens, chiefly because it is not easy to cultivate; 2, *Maxillaria tenuifolia*; 3, *Next week*.—*W. M.* *Tulipa sylvestris*.

**ORCHID DISEASE:** *Anciens*. Yours seems to be an ordinary case of Orchid disease, and there is no better treatment than to remove affected parts, and try and find more suitable quarters for the un-healthy specimens. Usually, irregular heating and defective ventilation start the disease.

FIG. 96.—LAMPRONIA RUBIELLA; RASPBERRY MOTH.

**ORCHIDS AND WATER:** *C. B. S.* Unfortunately, we cannot convert water from the mains into rain-water, although, as you suggest, Maignan's Anti-Calcaire will eliminate the lime, if there is any of this substance contained in the water, which will be the case with water supplied by the companies deriving it from your part of Kent. Can you not catch the rain which falls on the roof of your Orchid-house or other buildings, this being more beneficial to the plants than any kind of clarified or boiled water? If this be impracticable, and the water supplied is drawn from the Thames, it will be well to expose it to the air in a wide cistern or tub before using it, using Anti-Calcaire if you like to

do so, but we should say that the lime in this water is not present in injurious quantity. It may be prudent to use slightly warmed water, but the plants do not get their water warmed when growing in a state of nature, and it is not essential to healthy growth.

**PELARGONIUM OR GERANIUM:** *J. M., Cornwall*. If yours is a cardboard-box with no name on it, the flowers therein are varieties of Cape Pelargonium.

**PETUNIA:** *E. M.* There is no trace of fungus on *Petunia*. The spots on the leaves are caused by the cuticle being eaten away. Hence, there is some external mischief. *M. C. C.*

**PRIMULA ROSEA GRANDIFLORA:** *Cocker & Son*. A fine variety, with dense clusters of deep crimson flowers—very beautiful.

**STRAWBERRIES:** *J. A. B.* The leaves appear to have been sunburnt when wet.

**STREPTOCARPUS:** *Young Gardener*. It may be said that the treatment of these plants is similar to that usually followed with the *Gloxinia*, *G. speciosa*, in the matters of raising from seed, pricking off the plants, &c., excepting that better results are obtained if, after the seedlings are well rooted in thumbs or small 60's, they are planted out in beds on a mild hot-bed, or over hot-water pipes, a bottom-heat of about 75° being aimed at. Generally, it may be said that they require a temperature from 5° to 10° less at any season than the *Gloxinia*. When the plants which have been grown in beds reach a good size, they may be potted-up, using loam, leaf-mould, and sand.

**THE SWEET LIME:** *Limc*. Botanically—*Citrus Limetta*. It would grow under glass in this country under the same kind of treatment as that afforded the Shallock, i.e., intermediate-house warmth, &c. You could procure plants at the large plant-nurseries.

**TO DARKEN LIGHT-COLOURED GARDEN EARTH:** *Light Mould*. The following substances will darken the soil and likewise improve its fertility, which is doubtless not very great. Fine coal-ashes, soot, charcoal, admixture of dark-coloured soils, leaf-mould, partially rotten cow and horse-dung with the straw in it, spent Mushroom-bed materials, and rotten garden-refuse. It will be a work of time to permanently alter the colour. The spent Mushroom-bed dung, leaf-mould, and soot may be strewn on the surface as a mulch during the summer, or slightly covered with soil by the hoe.

**TOMATOS: Culture.** Almost innumerable notices have appeared in these columns, we therefore think that you will be acting wisely to purchase a little manual called *The Tomato, its Culture and Uses*, by W. Iggulden, and published at the *Journal of Horticulture*, 171, Fleet Street, London, E.C.; you will find your questions having regard to culture answered in that work more fully than we can do so in this column.

**VALOTTA, TULIP, HIPPEASTRUM:** *R. W.* Will you kindly let us inspect the bulbs which will not grow.

**WOODLICE:** *St. J. Arabin*. You will find that the application of scalding water is very effective in destroying these pests if followed up for a few weeks. It should be poured into their haunts, dashed under stoves, &c., at night when the insects are about. Remove all rubbish and anything under or behind which they can secrete themselves.

**COMMUNICATIONS RECEIVED.**—*R. McL.*—*F. Curtis*. *T. B.*—*N. E. B.*—*G. C.*—*W. R.*—*R. W. A.*—*B. M.*—*F. G.*—*W. T. D.*—*W. W.*—*A. Z.*—*E. W. B.*—*J. B. D.*—*California.*—*J. E. H.*—*W. **CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."**

**IMPORTANT TO ADVERTISERS.**—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of more than 90 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among country GENTLEMEN, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

AND FOR ALL  
GLASS STRUCTURES  
THAT REQUIRE  
SHADING.

It combines efficiency with appearance, convenience with economy, and its effects are lasting, while it is easily removed when necessary with hot water. It can be supplied either pale green or grey.

The public are warned against spurious imitations which are offered

them, through the success obtained for many years by Elliott's "Summer Cloud" Shading, and they should see that in ordering they get the "Summer Cloud," which is the only original and bona fide article, with the Trade Mark on each packet.

Sold in pkts., 1s. each, and in bags, 7 lb., 10s. 6d.; 14 lb. 20s.

To be had of the SEED and NURSERY TRADE generally. Manufacturers: CORRY AND CO., Ltd., London.

## ROBERT WARNER & CO.'S NEW PATENT WINDMILLS.

Saves Coal, Pumps Water, Grinds Corn, Cuts Chaff, &c.

Supports can be made in Teak, Iron, or Steel, for Hot Climates.

One of Robert Warner & Co.'s Patent Windmills will be erected and worked at the Royal Agri. Show, Leicester.

Prices from £17, including Pump and Timber Supports. May 27, 1893, The Dell, Englefield Green, Surrey. ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C. Dear Sirs,—It affords me much pleasure to inform you that the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,  
H. BALLANTINE, Head Gardener to Baron Schröder. R. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne.  
NUMEROUS OTHER TESTIMONIALS ON APPLICATION TO 27, JEWIN CRESCENT, CRIPPLEGATE, LONDON, E.C. Engineering Works, WALTON-ON-THE-NAZE, ESSEX.

## SELIG, SONNENTHAL, & CO.,

85, QUEEN VICTORIA STREET, LONDON, E.C.

GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

**A NEW FERTILISER.**—Protected by Her Majesty's Royal Letters Patent. A SAFE and NATURAL MANURE, in fine powder. Odourless, and most Economical for Every Variety of Plant in Windows, Conservatory, Stove, Tomato, Cucumber, Chrysanthemum, Vinery, and Orchard Houses. "VITALINE," or PURE ESSENCE OF BLOOD. Highest Testimonials. Absolutely unadulterated. Tins, 3d., 6d., 1s. Sealed Bags, 3 lb., 2s. 6d.; 7 lb., 5s.; 14 lb., 7s. 6d.; 28 lb., 12s.; 56 lb., 21s.; 112 lb., 40s.  
SAVAGE AND WALKER, Quebec Road, Norwich.

# STANDEN'S MANURE.

ESTABLISHED OVER  
30 YEARS.

Exceeds all others in General Fertilising Properties and Staying Powers.

It promotes a rapid, healthy, and robust growth to plants generally.  
It is a clean and dry powder, with very little smell.  
The highly-fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.
